Waltons' productions. In decorative treatment Messrs. Waltons' work offers great facilities, and peculiar advantages as compared with the old world methods of wall-papering. The prime cost is greater, but the ultimate result tends to economy. Landlords have a pleasant way of requiring householders to redecorate their premises at brief intervals. Tenants who introduce Lincrosta Waltons' into their scheme of decoration will avoid this form of recurrent expenditure, since Lincrosta, once fixed, is a perennial adornment (barring accidents), approaching to that thing of beauty which the poets claim to be a "joy for ever."

#### MESSRS. FREEMAN AND SHOOSMITH.

ONLY the most approved sanitary appliances were given prominence on Messrs. Freeman and Shoosmith's stand, which adjoined that of Messrs. Skey and Co. Foremost was their close-sealed intercepting trap, which provides better means for making the joint at the nose of the trap and gives better facilities for testing the whole of the joints of the drain. Among other advantages this invention dispenses with the unsatisfactory system of using an ordinary T junction, thereby doing away with an untested joint and ensuring a perfect sewer-gas proof drain. Freeman and Shoosmith's

improved reversible yard sink or gully trap was also on exhibition, and as is well known, is especially desirable as, having a reversible top, the body of the gully can be set to any angle or line of the drain or building, ensuring a straight line from the gully to the main drain of the building, which thus obviates the necessity of undesirable bends. Patent closet traps, brass drain testers, and other sanitary appliances were also shown.

#### MESSRS. G. SKEY AND CO. LIMITED.

A "SPIRALVENT" chimney-top was the leading exhibit of Messrs. G. Skey and Co., of Wilnecote Works, near Tamworth. It has proved very satisfactory in preventing smoky chimneys, but in increasing up-draughts it is equally desirable. Messrs. Skey made a very representative display of sanitary goods, and other exhibits included white and buff channels, buff and salt-glazed sinks, damp-proof courses, salt-glazed drain-pipes, traps, interceptors, &c., of stoneware, and not fire-clay. An example was shown of a closet specially made to meet the requirements of the Works Department of the London County Council. The background of the stand was relieved by a display of tiles of beautiful quality and colour.

#### THE DARLEY DALE STONE CO.

The Darley Dale Stone Company had on exhibition samples of stone from their various quarries, including Stancliffe, Farley, Bentley Brook Old Quarries, Crowford High Peak Quarries, &c. It was mostly dressed stone, and its durability is well-known.

#### MESSRS. C. W. OUTRAM AND CO.

As sanitary goods go, Messrs. Outram, of Woodville, near Burton-on-Trent, made an attractive show. The two most notable exhibits, perhaps, were the "Swiftsure" wash-down closet and the "Aquarius" closet. The "Swiftsure" has been designed to ensure perfect immunity from the dangers of sewer gas escape arising from the faulty construction of, and method of fixing the present system of closet. In the "Swiftsure" closet the soil trap terminates above the floor level, and, with its brass fittings, which take the place of putty, is thus open to inspection, whilst other improvements suggested by forty years' experience have also been incorporated. The "Aquarius" closet will also be found to meet the most stringent sanitary strictures, having an outlet which can be turned in any direction, and an excellent connection of closet and soil pipe. Lavatory basins, traps, fountains, and innumerable other goods were exhibited.

#### MESSRS. S. AND E. COLLIER.

Red terra-cotta work of almost every description was to be seen on the Stand of Messrs. S. and E. Collier, of Gravelands, Reading. Smooth-faced and sand-faced tiles, plain tiles, and ornamental tiles, chimney tops, ridges, and finials, were all included in the collection, but there was no speciality to note with the exception, perhaps, of Fletcher's patent chimney-pot for curing down draughts, and the sand-faced, hand-made roofing tiles, which are desirable in cases where the tile is required to tone down quickly. All the goods were in a good deep red, and it is the colour and quality of material, rather than novelty in construction, to which Messrs. Collier draw attention.

#### MESSRS. BROAD AND CO., LIMITED.

MESSRS. BROAD AND COMPANY, of Paddington, exhibited a large variety of white enamelled ware goods and drainage accessories with the latest improvements. Their patent sink is one likely to be very largely used, as it obviates some of the objections to the ordinary scullery sink. The white enamelled drinking water cistern exhibited was obviously perfectly adapted for the purpose, whilst the sewer gas interceptors are now so well-known as to need no comment. At this stand were seen excellent patterns of fire-clay closets, especially an "Infantile Closet," designed for schools; also manhole covers, drain-pipes, and a selection of sanitary specialities for which the Company is well known. Some excellent specimens of terra-cotta were also exhibited, the buff being especially good, the rich colour of deep golden hue proving very attractive.

#### MESSRS. H. J. AND C. MAJOR.

"MAJOR's patent interlocking plain tiles" were shown in position on Stand 102. A feature of the tiles is the ribs and fillets, which are so arranged as to offer complete resistance to the passage underneath of rain and snow, and also by the method of interlocking, of preventing wind stripping in the most exposed situations. The method of hanging them on the laths by ribs or buttons is as usual, but the interlocking parts render nailing or pegging unnecessary. The tile may be easily removed and replaced without in any way impairing the soundness of the roof—a material advantage which has met with wide-spread recognition. Being made of the best alluvial clay under heavy pressure by powerful machinery absorption of moisture is minimised.

#### THE GRAY'S CHALK QUARRIES COMPANY, LIMITED.

The scope and range of the bricks manufactured by the above Company was shown in the three examples of decorated window openings on their stand—103. The bricks were also exhibited singly in colours ranging from red to chocolate, together with mural tiles and panels, garden edging, plain roofing tiles, Essex flints, &c.

#### MESSRS. J. GRAYSON LOWOOD AND CO. LIMITED.

The above Company (Sheffield) had a model on show built of the celebrated "Lowood" Silica bricks for high and continuous heats, as employed in the Siemens-Martin open hearth furnaces, chemical works, &c. The refractory power of these bricks has now been well established, whilst in durability they are equalled only by the special Ganister and firebricks manufactured by the same company.

#### F. G. TUXFORD, DEGANWY.

MR. TUXFORD exhibited a small model roof covered with fancy Gothic slates, slate ridge, and slate finials, along with various sample slates, finials, and ridges. Two notable exhibits on the stand were some old slates in good condition after fifty years' wear, and an example of thin splitting of Oakley slate, showing a very unusual cleavage.

#### MESSRS. J. RIDDIOUGH AND SON.

This Bradford firm exhibited samples of the renowned Bolton woodstone, which has been very largely used by sculptors and monumental masons. It is white in colour, very fine in texture, and is capable of a high polish. Building stone from Eccleshill Quarries, Bradford, was also shown.

#### MESSRS. FENLAN AND SON.

SEVERAL up-to-date heating and ventilating appliances were shown by Messrs. Fenlan and Son, of Tudor Street, E.C. They included their patent hot-water apparatus, to burn gas or oil, for conservatories, their patent hot water circulating condensing stove, which also burns either gas or oil, and circulating hot-air and hot-water condensing stoves with propagators combined. Messrs. Fenlan's patents are undoubted achievements in engineering skill; there is a completeness about all their specialities; but the greatest success seems to be in connection with the heating of greenhouses and conservatories. They regard the construction of the boiler as especially important under certain conditions, and they have designed a boiler which is independent of the atmosphere of the conservatory. All the heat thrown off the boiler is utilised, and yet it remains equally as independent of the atmosphere of the greenhouse to support combustion as though it were fixed in the open air.

#### G. J. FARROW, BRIXTON.

"FARROW's Patent Improved Portable Iron Scaffold" towered at the further end of the hall. It is claimed for it that it has the advantage of the ordinary scaffold in the speed with which it can be erected, its adaptability to the height of any room or building, and movability in any direction upon castor wheels. These scaffolds, we are told, will also do duty as observatories, triumphal arches, water towers, &c.

#### J. ARNOLD, CAMDEN TOWN, N.W.

SANDS of all kinds for building purposes were shown by Mr. Arnold, on whose stand miniature sacks contained the various samples, which included a special sand for water and sewage filtration.

#### MESSRS. MERRELL AND COMPANY.

MESSRS. MERRELL AND Co., of 45, Corn Exchange Buildings, Fennel Street, Manchester, exhibited Coupe's patent screw-key and screw-bolt, which provide an easy way of fixing together chairs, tables, show-cases, shop-fronts, &c. When fixed, perfect security is obtained, and with the same ease that the fixing is carried out, the various parts may be detached when occasion arises. The "Moso" patent frost-proof pump and patent sash-fasteners were shown on the same stand.

#### A. J. ELLIS, READING.

IN Ellis's patent system of glazing, a model of which was shown on Stand 119, rolled steel bars with condense gutters take the place of putty and painting. The compensating arrangements consist of a spring clip which presses the zinc caps on the glass, and is so fitted as to leave the metal free to expand, and thus avoid a breakage of glass through a sudden change of temperature.

#### MASON'S PATENT REVERSIBLE WINDOWS.

THERE was great simplicity about all the window sash patents exhibited at the Exhibition, and Mason's was no exception. It is designed to ensure perfect safety in cleaning and repairing, and also as a means of ventilation, for the window can be opened and the air directed upwards. Another point in connection with Mason's patent is that in whatever position the sashes may be put in, the full weight is always bearing direct on the pivots and cases, and never dependent on the screws. When the screw opener and fastener is tightened up, any rattle is impossible, and the ventilator can be well regulated.

#### THOMAS PULFORD, CANNON STREET, E.C.

STAND 121 was filled with a variety of varnishes, japans, colours, &c., for high-class decoration. A damp wall paint, impervious to moisture, is worth special mention. It resists atmospheric action, and is a very good preserver of wood.

#### E. V. HARRIS, SOUTHAMPTON.

It is said that the sash window has much to answer for in its influence upon Architectural styles. But it seems as though the sash window of to-day will be unknown a few years hence. Harris' improved patent reversible window sashes are made so as to be brought wholly into the room by working on a pivot. The patent can be fitted to existing sashes as well as being applied to new.

#### AERAGON ROAD JOINERY COMPANY.

IN addition to the examples of round and square turnery and handrail mouldings shown by the above company, an invention for window cleaning known as the "L.O.O. Safety Cleaner" was exhibited. It is a very simple but efficient arrangement by which both sides of a window can be cleaned simultaneously from the inside without opening the sashes more than a few inches. It will also clean a casement light equally as well as a sliding sash, and its simplicity is such that its appearance at once suggests its order of working.

#### W. GOODING, HOLLOWAY, N.

MR. W. GOODING, of North Road, Holloway, shows numerous examples of his patent interchangeable rubber stair-treads. To anyone who has examined these treads, their advantages are obvious, allowing, as they do, of the easy replacement of worn rubbers, besides giving a firm elastic footing in all weathers. They are adaptable for railway stations, railway carriages, tramcars, yachts, &c. They are non-slipping, and evidence of their durability was forthcoming in a model tread exhibited, which had been in use for a period of nine years. A special feature of this tread is the use of a metallic keeper, fitted with pieces of rubber, which project above the metal, and form the wearing surface.

**MESSRS. TOWERS AND WILLIAMSON.**  
ADAMANTINE clinker paving and roofing tiles were shown by Messrs. Towers and Williamson, of Little Bytham, Grantham. The advantages claimed for clinkers are that they are extremely hard and durable, scarcely any absorption, less slippery than vitrified paving, and consequently make an excellent sanitary paving. They are made plain and chamfered, and in buff and red colour. The firm's roofing tiles and paving bricks are claimed to be practicably imperishable and non-porous.

**ANAGLYPTA COMPANY, LIMITED.**  
THE advance made in the decorative treatment of Anaglypta during the ten years it has been upon the market was well evidenced at the Exhibition. Instead of bringing the panels in high relief, directly up against the cornice, as heretofore, the Company is now making special mouldings, which are finished off within six inches or a foot of the cornice, so as to hide the finish of the relief. The mouldings are specially made to suit the designs, and the union of the two has invariably a very pleasing effect. It is noticeable that the relief of the patterns made by the Anaglypta Company has been appreciably increased during recent years. The effect of this is obviously to give a more plaster-like effect, and to meet the increasing demand which is now being made for decorations in high relief. We may add that the Company now issues a high-class book of litho plates, illustrating their numerous patterns.

**THE SANDSTONE SYNDICATE, LIMITED, OF LONDON.**

THE Sandstone Syndicate of London made a very striking contribution to the Exhibition. Their exhibits, made of an artificial stone that has long been tried successfully on the Continent, were varied and were encircled by a balustrade and doorway. It is claimed that the stone of this Company is equal to Portland in durability; and one advantage it possesses over other natural stones is that it can be so moulded as to only entail a minimum of waste. It can be worked from the block, as it has no cement facing or other drawback. It strongly resembles natural stone.

**PATENT VICTORIA STONE COMPANY.**

ANOTHER display of stone was to be seen on Stand 98. The Patent Victoria Stone Company claim for their stone that it is suitable for nearly all constructional purposes, and that its strength and hardness will compare very favourably with various bricks and other kinds of stone, whilst it is especially adapted for decorative treatment. An exhibit on their stand well worth noticing was a moulded, bracketed, grooved staircase, with enriched newel moulded banisters and moulded hand-rails; whilst a window in red stone, two columns, one plain and the other polished, could scarcely fail to attract attention. The material itself is an amalgamation of granite and Portland cement, steeped by a patent process in a solution of flint, by which it becomes a non-porous stone of a hard and durable character.

**THE MARBLE MOREAU-RAE SYNDICATE, LIMITED.**

THE highly decorative effect which can be obtained in Moreau-Rae marble was well illustrated by the specimens shown on the above Syndicate's stand. The Moreau-Rae marble is a natural, soft, white limestone, coloured, hardened and converted into marble by Moreau-Rae's patent chemical process—a process which, by the way, has lately been greatly improved, and has considerably reduced the time required for making marble. The stone is worked and carved in the soft state, and Architects will especially appreciate a material which leaves them untrammelled by the consideration of extras for thickness, &c.

**GEORGE WRAGGE, MANCHESTER AND LONDON.**

MR. WRAGGE's exhibits served to illustrate the great progress which decorative metal work has made during the last twenty-five years. Whereas

Gothic was the all-in-all a quarter of a century ago, examples of metal work in Grecian, Italian, and Renaissance styles are now very common. Nearly all these styles are included in Mr. Wragge's collection, but in addition there is a very great variety of fittings, such as Repoussé finger-plates, lock furniture, ventilating casements in coinage metal, and also fittings in Kronand metal and aluminium.

**SWANSEA SIEMENS BRICK COMPANY.**  
THIS Company had on exhibition a selection of high-class refractory Silica fire bricks and slabs, manufactured by patent process. On the same stand there was also a collection of patented grates for gullies, manufactured by the Malleable Spring Grid Company of Cardiff.

**MESSRS. T. C. MOLESWORTH AND COMPANY.**

MESSRS. MOLESWORTH AND COMPANY's stand was mostly occupied by blocks of Ketton Oolitic freestone—a stone which was extensively used by mediæval masons, and examples of which are to be seen at St. Dunstan's Church, Fleet Street; St. Pancras Station, &c.; and, in the provinces, at Ely, Peterborough, and other Cathedrals. The absorbing power of Ketton stone is about 14 per cent, and the crushing weight is 1½ tons to the square inch; it is very compact and even in formation, and has a beautiful warm, cream colour. Old monuments made of this stone fully prove its weather-resisting qualities.

**THE BUXTON LIME FIRMS COMPANY, LIMITED.**

BUXTON lime, stone lime, limestone chippings for footpaths and carriage-ways were included among the exhibits on the Buxton Lime Firms Company's stand. Buxton lime is considered specially suitable for sewage precipitation and gas purifying, and an analysis issued by the company strongly supports its claims in this direction. The feature of the stand, however, was a display of limestone tufa and spar for rockeries and garden work, around which was constructed a miniature gravel path.

**JOHN ROOKE, KETTERING.**

ANOTHER exhibition of stone was made by Mr. John Rooke, of Corby, Kettering. This time, it is the Oolitic building stone from Lord Winchelsea's quarries at Weldon, which claims attention, and we might pay a deserved tribute to its weather-resisting capabilities; that a block of this stone was on exhibition bearing the eloquent letters M.D.C.X.L.

**THE MANSFIELD PATENT CHIMNEY POT COMPANY.**

To prevent down draught without the use of mechanical chimney cowl is the aim of the "Mansfield" chimney pot, which is simply constructed in two parts to facilitate fixing. It is made in salt glazed fire-clay, and also in buff and red terra-cotta, and in practice combines efficiency with durability.

**E. HOLWILL, TEMPLE CHAMBERS, E.C.**  
A VERY representative show of bricks and tiles was made by Mr. E. Holwill, of Temple Chambers, E.C., of white and coloured clayed bricks. A speciality was made of grey for dados, house fronts, &c.; damp and acid-proof engineering bricks, impervious buff stoneware facing bricks, and buff and grey Architectural terra-cotta were a few of the other exhibits on this Stand.

**MARK GENTRY, HEDDINGHAM.**

RED hand-pressed and hand-made facings, rubbers, and moulded bricks shown on Mr. M. Gentry's stand, do not require a lengthy description. They are too well-known. Arch bricks in rubber earth made to any size, length, and radius, was a speciality which must meet with general appreciation, as, being ready for fixing, labour is reduced to a minimum. Mr. Gentry carries out Architects' designs in chimney-pots.

**MESSRS. SERCOMBE AND COMPANY.**

MESSRS. SERCOMBE AND COMPANY, of Leicester, showed a model of an improved continuous kiln for burning all classes of bricks, terra-

cotta roofing-tiles, &c. Messrs. Sercombe's great claim for their kiln is that it involves a great saving in fuel; it also possesses other advantages in the facility with which its fires can be manipulated, and a free draught from or to the top and through all chambers. It has no complicated system of flues or dampers, but yet any required heat can be obtained and sustained at will.

**THE SOMERSET TRADING CO., LIMITED.**

THE Somerset Trading Co., Limited, of Bridgwater, showed a model house covered with their improved, pressed, triple angular tiles. These tiles are of a rich red colour, manufactured from selected Bridgwater clays, and are made and pressed by specially designed and patented machinery. They make a very good cover, as the corners are not cut off, and, considering their quality, with their cheapness, are undoubtedly very desirable tiles.

**MESSRS. DAVID AND LANT, LIMITED.**

FOREST OF DEAN stone was the principal exhibit here, and its texture and uniformity of colour was well demonstrated. The blue and grey somewhat resembles York in appearance, but are a little harder, and finer in grit. A great feature of Forest of Dean stone is that it always retains its natural colour; it has been largely used throughout the country for engineering, building, and monumental purposes. Messrs. David and Lant are working the lower beds of their quarries, from which the best quality and most durable stone is obtained.

**MESSRS. HAYWOOD AND COMPANY, LIMITED.**

MESSRS. HAYWOOD AND COMPANY, of Moira, Ashby-de-la-Zouch, had the usual collection of sanitary pipes and sanitary accessories, including Soak's patent safety joint and also Soak's patent for a true alignment. A pipe was shown which had broken at 140lb. pressure, whilst a second pipe remained intact with 130lb. pressure. Other exhibits included interceptors, garden tiles, air bricks, enamelled sinks, &c.

**THE CORONET BRICK AND TERRA-COTTA COMPANY.**

AN exclusive collection of terra-cotta goods, comprising finials, ridges, vases, chimney tops, terra-cotta springs, panels, air grates, arch bricks, was exhibited by the Coronet Brick and Terra-Cotta Company. All the goods were of a uniform red—the natural colour of the clay—and were treated in numerous decorative styles.

**MESSRS. J. W. PALMER AND COMPANY.**

MESSRS. PALMER AND Co. showed samples of iron fencing and hurdles, corrugated fencing, galvanised stable fittings, &c. A speciality on the stand was an example of an unclimbable steel wire fencing, the framework of which is erected and strained in the same way as the ordinary wire fence, after which the verticals are securely bound on to the horizontals. The fence is elegant in appearance, whilst on grounds of utility it is equally satisfactory. Another example of fencing—oak pole or combination fencing—was also on exhibition. The poles are tightly held in position by wires of two strands, which grasp them on each side, and are tightly interwoven. The pattern has two or three lines of strong galvanized steel strand wire running at back of the poles, to which the latter are securely stapled, thus giving it great rigidity and resisting power.

**MESSRS. ALFRED GOSLETT AND COMPANY, LIMITED.**

THERE was a more or less uniform excellence of design in the brilliant cut and bevelled and silvered glass, shown by Messrs. A. Goslett and Company, of 26, Soho Square, W. But one exhibit attracted special attention. It was a specimen of figured rolled for facia works, which would make an excellent background. A good sample of embossing for public-house decoration was also shown, whilst an overmantel in Louis XV. style could not fail to attract attention. It was of pine, in white, with gilded enrichments, and would

have enhanced the decorative charm of any drawing-room. A combined lavatory stand and looking-glass was another exhibit out of the ordinary; whilst wall-papers in original designs were also included in the display.

#### MR. S. BUTLER, VAUXHALL, S.W.

MR. BUTLER exhibited a variety of wood-working and general machines for the use of builders and contractors. The wood-working machinery comprised tools for planing, squaring up, chamfering, stop chamfering, thicknessing, straight and circular moulding, circular sawing, band sawing, morticing, &c., and a Stockport engine was seen at work driving the dynamos which lighted the Hall.

#### MESSRS. NEWSUM, ROBERTS, AND COMPANY.

Low pressure hot water heating apparatus was shown in work by Messrs. Newsum, Roberts, and Company, of Charmouth Street, Beeston Road, Leeds. The radiators, known as "Leeds" ornamental radiators, have been specially designed for entrance halls, reception rooms, &c., and require no box work or covers, as they are of a beautiful pattern and may be decorated to correspond with the rooms in which they are placed. An example of Newsum's conical boilers, which have been largely used in Churches, Chapels, schools, conservatories, &c., was also shown, and its simplicity of construction and effectiveness in all its heating processes were demonstrated.

#### THE FERRYBRIDGE FOUNDRY COMPANY.

Of the "Fryston" kitcheners manufactured by the Ferrybridge Foundry Company there were several examples on show. The duplex or simplex fires at the pleasure of the user is the distinguishing feature of the "Fryston." It has no descending flues, and oven and roaster are dispensed with. It has open and close fires, a sliding fire-panel, and horizontal and upright draught throughout. Plinth and all raised parts are ground, and the bright parts are nickel-plated.

#### LONDON WARMING AND VENTILATING COMPANY, LIMITED.

The above Company showed a number of patent stoves in which anthracite coal was consumed. Anthracite coal is claimed to be an ideal coal for most purposes; it is smokeless, bright, healthy, and economic, and, above all, is a safe fuel, as it deposits no soot in the chimney, and, moreover, does not scatter its embers in the erratic fashion peculiar to common coals. The patent stoves exhibited included the "Jackson" continuous burning anthracite grate, the "Cheminee" continuous burning anthracite stove, the "Salamandre" ditto, the "Mansion," the "Brilliant," &c.

#### PITTMAN PAINT COMPANY, LIMITED.

The Pittman Paint Company, of 2, Colonial Avenue, Minories, E.C., had a large stand on which their paint in almost every tint was shown. Pittman's paint differs from ordinary paint in that it answers other purposes beyond those of renovation—it will waterproof any structure or object to which it is applied. It has a brilliant polish, and when once dry will never blister, crack, or peel off. It is non-corrosive, and is specially recommended for ironwork, tinwork, stoves, mantelpieces, &c.

#### MESSRS. MENSAQUE AND CO.

STAND 4 in the bays attracted considerable attention. It contained an interesting collection of Moorish tiles, which are being introduced into this country by Mr. G. A. Trapp, on behalf of Messrs. Mensaque and Co. The beauty of design and manufacture of the tiles exhibited was much admired. Moorish tiles assist in the decoration of the Alhambra at Grenada, the Alcazar at Seville, and the Mosque at Cordoba, whilst in London they are seen to perfection at St. James's Hall and at the new entrance of the Alhambra Theatre just opened in Charing Cross Road. The tiles are most effective in large places of entertainment, their brightness and richness of colour giving a very fine effect. Moorish pottery and panels were also exhibited.

#### THE BARTON LIMESTONE COMPANY.

THE Company exhibited encrinital stone, polished stone, rockery stone, &c., from the Barton Quarries. Stone from these quarries is of a very pure character, consisting almost entirely of carbonate of lime. Its value for chemical purposes is, therefore, at once established. The engineering and building stone is, by its hardness and durability, especially suited for piers, quay walls, &c.; the polished stone is seen at its best in pillars and steps, the encrinital gravel makes a very durable path, and the same remark also applies to the road metal, which is taken from the lower beds of blue limestone below the encrinital sections.

#### THE "LOCO" DRAINING APPARATUS COMPANY, LIMITED.

ABOUT a dozen different patents in sanitary goods were exhibited by the "Loco" Draining Apparatus Company, Limited. These included the patent "Loco" deflector traps with horizontal and vertical outlets on the same principle, "Loco" bath with compulsory self-cleansing overflow and rapid outlet, "Loco" lavatory with compulsory self-cleansing overflow and rapid outlet, "Loco" sink with compulsory self-cleansing overflow and rapid outlet, detached fitting and sections of the patent "Loco" compulsory self-cleansing overflow, and the "Loco" closet cistern silencer, which may be applied to all syphons and cisterns, and silence is thereby obtained.

#### LAWRANCE SEAGER, SITTINGBOURNE.

MR. SEAGER not only exhibited his patent reversible dust, draught, and burglar proof sashes and frames, but also an example of his improved steps, which combine both a trestle and ladder. The sides are fitted with semi-circular stays in which there are a series of indents, and being fixed on one half of the ladder, pass through strong staples, which are provided with spring bolts fixed on the other half. It is specially desirable for use over a bay window or other projections which necessitate an ordinary ladder being reared at a dangerous angle.

#### MESSRS. GODWIN AND COMPANY, CHELSEA.

IN the South Gallery Messrs. Godwin, of Park Walk, Chelsea, exhibit a small but very charming collection of flock papers. An interesting and well-executed frieze in double flock; a crimson flock with corn-coloured design; and an exceedingly clever silk flock in shaded greens, form the most striking features of the exhibit. There is also a ceiling paper in three flocks, of geometrical design, which is singularly effective. Altogether, it is cheering to see evidences of life and enterprise in so old and highly respected house as Messrs. Godwin's.

#### MESSRS. HUMMELL AND CO.

MESSRS. HUMMELL AND CO., of 55, Bishopsgate Street Within, E.C., had a small structure roofed with asphalt slates, whilst their application to walls was also illustrated. Asphalt slates are practically unbreakable; they are very much lighter than ordinary slates and their first cost is also considerably less. These slates have been extensively used in Norway and Sweden, and their introduction into England bids fair to be attended with a great measure of success. They are laid on laths like ordinary slates, and at no time is a coating of tar or any other substance required.

#### THE NATIONAL OPALITE GLAZED BRICK AND TILE SYNDICATE, LIMITED.

A BUILDING was shown entirely constructed of Opalite glazed bricks, which the Syndicate maintains are superior to ordinary glazed bricks in many ways. It has a beautiful polished surface, of which it cannot be deprived by exposure to damp, frost, or heat—as an exhibited example, which had stood these tests, proved—and its surface being so highly polished, dust and dirt will not readily adhere to it. "Opalite" is made in a variety of tints, and as it can be applied when brick work is finished, close joints are secured and heavy

waste in breakages is avoided. Its qualities are best appreciated in bath rooms, lavatories, corridors, dairies, and subways. Numerous tiles were exhibited on the stand adjoining the Opalite buildings, as typefying the varied treatment of design of which the material is capable.

#### MESSRS. BOULTON AND COMPANY.

MESSRS. BOULTON AND COMPANY'S stand was mostly occupied with tiles of various descriptions. They included a superior tessellated paving tile, superfine pressed paving tile in red, blue, buff, and black, a medium pressed and ordinary pressed paving tile in the same colours, a terra metallic garden edge tile in different patterns, blue Staffordshire coping tiles, &c. Blue Staffordshire bricks, finials in a large variety of patterns, and adamantine clinkers also found a place on the stand.

#### THE IMPERIAL STONE COMPANY, LIMITED.

A LARGE stand was taken up by a display of the Imperial Stone Company's goods, which included an arch, a flight of steps, ornamental plaques, balls, cups, &c. Imperial stone, as is well known, is produced by an artificial process, and inasmuch as it never shows the patches so often seen on the surface of hand-made slabs, has been in great demand. The Imperial Stone Company also manufactures silicated stone pipes, whilst miles of its celebrated "Petrositicon," an *in situ* paving for public footpaths, railway platforms, &c., have been laid down in different parts of the kingdom.

#### OTHER EXHIBITORS.

OTHER exhibitors on the gallery included Messrs. G. Brooke and Sons, Hipperholme, near Halifax, who exhibited examples of "Spamesfol" Silix hard York stone; the Somerset Quarry Company, Frome, who had black stone, spar, macadam, gravel, and sand on show; the executrix of the late C. F. Chadwick, Carlow Quarries, Nelson, with samples of building and monumental stone; the Whitland Abbey Green Slate Quarries, of Clynderwen, R.S.O., with sample slates from Llandilo Quarry; Messrs. T. Clark and Sons, Idle, near Bradford, with samples of hard York stone, and Ashlar and Delph stone, sawn and worked; William Mitchell, Lees Moor, near Keighley; the Radnor Company, Limited, Kington, with samples of kerbstone, channel stone, building stone, paving slab, granulated chippings as produced especially for concrete work, asphalt, garden walks, &c.; J. P. Bailie, Cardigan, South Wales, with samples of bricks, &c.; Darbishes, Limited, Penmaenmawr, with sets, channels, macadam, chippings, &c.; Yate Fireclay and Brick Company, Limited, Chipping Sodbury, with silica fire bricks, fire squares, boiler shields for steamships, &c.; W. T. Chapman Grimsby Road, Cleethorpe, with panels, chimney pots, &c., in buff terra-cotta; the Castle Fire Brick Company, Limited, Northop, Flintshire, with Buckley blue fire-bricks, slabs, &c.; Messrs. Cocking and Sons, Walkeringham, Gainsborough, with red and white facing bricks; J. B. Tomblesen, Barton-on-Humber, with bricks, ridges, pavings, &c.; Elham Valley Brick and Tile Company, Limited, Elham, Kent, with samples of bricks, &c.; the Abercwmdeiddaw Slate Quarry Company, Limited, Machynlleth, with specimens of slates, slabs, &c.; and Messrs. G. Farrow and Sons, South-orram, Halifax, with various samples of stone.

#### OUR STAND.

We have been complimented on all hands on the decorative treatment of our stand at the Exhibition. But much of the credit should go to Messrs. Waring and Company, of Oxford Street, who not only erected the stand, but furnished it throughout. The good taste they displayed has been readily and generally acknowledged. The appearance of the interior of the pavilion was much enhanced by a display of drawings by Mr. Joseph Pennell, Mr. C. E. Mallows, Mr. F. Griggs, and Messrs. Hall, Cooper, and Davis; three valuable water-colours by Mr. G. C. Haite, and many others by artists well-known in the Architectural world.

**The Brick Famine.** THE scarcity of bricks, which has so seriously interfered with the process of building during the past months, we may hope is now, with the return of spring and the re-opening of the brickfields, approaching to an end. Nor does the relief come a week too soon. Round London the dearth of bricks has been severely felt. A month ago London stocks stood at fifty-five shillings a thousand, and the price has been

about forty shillings a thousand. In many places old houses have been prematurely pulled down, and the bricks re-used. The cause of the famine is not far to seek, inexplicable as it may seem. It is due entirely to the enormous quantity of building which has been progressing all round London during this last winter, and now that the season of the greatest activity in building is come round, contractors find there are no bricks left. London is shooting out tendrils and branches through all its suburbs, and a ring of new buildings has been raised about it this winter that may be compared to the annular rings in the growth of a tree. To trace back in its turn the cause of this phenomenal activity is a difficult matter. People want houses in London, and houses they must have, with all the supplementary retail trades and accommodation for the complex systems of our artificial life. Some years ago the number of public-houses in London for every thousand inhabitants was

bricks at this present time; but we hope shortly to see signs that things are returning to their normal condition.

### Important London Housing Schemes.

THREE measures under the Housing of the Working Classes Act, 1890, relating to the County of London, have been, or are now engaging the attention of Parliament, and a few details regarding them will doubtless be read with interest. The first of them is a comparatively small affair. The London County Council require to purchase and take certain lands compulsorily for the purpose of providing lodging-houses for the working classes, and following the statutory course the Home Office, on being applied to, made a provisional order which has been confirmed by both Houses and has received the Royal assent. The property to be taken is described as "a piece of vacant land abutting on the north side of the Borough Road and bounded on the north by King James' Street, on the south partly by the Borough

REMAINS OF A BYZANTINE PALACE, CONSTANTINOPLE.

rising since; indeed, it may be doubted whether sound English stocks are now anywhere to be purchased. A fair price has been given for rubbish that never aspired to the name of brick, and "grizzle" and "place," the execrated of specification, have found an honourable place in the citations of the market. We have ourselves seen a quantity of "grizzle" bricks, the accumulated wasters from the kilns, shapeless and fused together into lumps of clinker, and fit for nothing but bad road metal, being used on a private building of some pretensions. The brickfields, however, are all making up again now, and we learn from the British Clay-worker that new fields are springing up everywhere to meet the demand, and that the manufacturers of brickmaking machinery cannot complete their orders at the pace at which they come in. Some alleviation has been afforded by Belgian and French bricks, which have been extensively availed of along our southern shores, and have also been delivered in London, where they fetch

eleven, and the butcher, the baker, and the candlestick maker all had their due proportion to the population also. Why, however, this particular year should have run ahead of all others, and the country chosen this rather than another year in which to come to town, we cannot decide. It hardly seems possible that the Diamond Jubilee can altogether account for it. We may remember besides that if the weather this winter has not interfered with the processes of building as much as often is the case, still the protective attitude taken by the Plasterers' Union in refusing to work overtime has delayed building operations seriously, as we may know from the high wage that plasterers have been paid during the past three months of their embargo. It may well be realised that the famine has proved disastrous to many builders, who, having entered upon heavy contracts, have found bricks quite unprocurable at any reasonable price, and many builders have of late refused to tender. It is the small contractor who mostly suffers by the high price of

Road, partly by the Bridge House public-house in the Borough Road, and partly by premises in Warwick Street, on the east partly by Lancaster Street and partly by the aforesaid public-house, and on the west by premises in the Borough Road and Warwick Street, the whole of such piece or parcel of land containing 21,800 square feet or thereabouts." The scheme that is next put forward is of much greater magnitude and larger significance, and is the Churchway, St. Pancras, which is a different and very much more important scheme than the one we have just described, seeing that the number of persons of the working class who will be displaced if it be carried out in accordance with the order is estimated at upwards of 1000. So long since as October, 1893, an official representation was made to the London County Council by Dr. Shirley Forster Murphy, the medical officer of health for the administrative county, that certain houses, courts or alleys within this area (which lies between Euston Road and Drummond Street, with Seymour Street to the S.W.), were unfit for human habitation, and that the narrowness, closeness, and bad arrangement, or the bad condition of

the streets and houses, or the want of light, air, ventilation, or proper sanitary conveniences, or other sanitary defects, or one or more of such causes, were dangerous or injurious to the health of the inhabitants, either of the buildings in the area, or of the neighbouring buildings, and that the evils complained of could not be effectually remedied otherwise than by an improvement scheme. The Council considered the matter, and framed a scheme; and the Home Secretary, after due enquiry, made an order provisionally confirming the scheme, subject to certain conditions and modifications. That order, as modified, has been confirmed by both Houses, and, like the preceding one, has received the Royal sanction. The actual number of persons of the working class that will be displaced under the scheme is estimated at 1095, occupying 423 rooms in 272 holdings. The site is, of course, to be cleared of the existing buildings, and the new dwellings are to be constructed so as to afford in the aggregate suitable accommodation for not less than 580 persons of the working class. Churchway is to be widened, from Drummond Street to Grafton Place, to a minimum width of 40ft. Wellesley Street is to be extended in width to 40ft. between Seymour Street and the new Churchway, and Churchway, from Grafton Place to the Euston Road, is to be stopped up and form part of the improvement area. Such of the lands in the improvement area as shall not be required for the purpose of providing accommodation as aforesaid for 568 persons of the working class may be sold, leased, or otherwise disposed of. The Bill embodies an agreement between Lady Henry Somerset and the London County Council, which is subject to confirmation by the Court of Chancery, but which would be of very beneficial effect to the ratepayers, seeing that under it the total net estimated cost of the scheme would be reduced from £51,650 to £39,150.

#### CLARE MARKET.

This is an even larger scheme than the foregoing. It originated it would seem out of a representation made to the London County Council by Dr. F. J. Allen, the medical officer of health for the Strand district, as to a large area situated in the parishes of St. Clement Danes, St. Mary-le-Strand, St. Giles-in-the-Fields, and St. Martin-in-the-Fields. The scheme was submitted to the Home Secretary, who, after the usual inquiry, approved it subject to certain modifications. Under it 2893 persons of the working class occupying 1208 rooms in 835 holdings, and 279 occupants of lodging-houses—3172 in all—will be displaced. In respect of these the Council proposed to provide in the area, to which the scheme relates, accommodation for 500 persons of the working class, and on part of the site of Millbank Penitentiary accommodation for 1269 others, thus making a total provision for 1769 of the displaced persons. The Home Secretary's order prescribes that there shall be provided accommodation for 750 persons upon the improvement area, and in the dwellings on part of the Millbank site accommodation for 1500 persons, making a total provision for 2250 souls. This displacement of working people is to proceed by degrees, and is not to be carried out without the approval from time to time of the Home Secretary, as the old buildings are removed and new ones erected. As a part of the scheme Drury Lane is to be widened to 40ft. by setting back the whole of the frontage on the east side between Blackmoor Street and Kemble Street, Blackmoor Street is to be widened to 40ft. by setting back the whole of the frontage on the north side between Drury Lane and Stanhope Street, and Clare Street is to be widened to 40ft. by setting back the whole of the frontage on the south side between Stanhope Street and Clare Market. The Bill embodying these proposals has passed the Commons and is well advanced in the Lords.

MESSRS. EASTON, ANDERSON AND GOOLDEN, LIMITED, inform us that having disposed of their premises in Whitehall Place, their London address is now Broad Sanctuary Chambers, Broad Sanctuary, S.W., adjoining the Westminster Palace Hotel.

#### THE BORGIA APARTMENT.

WORK of some importance in the history of Art has now been completed in the Vatican by his Holiness Leo. XIII. The "Appartamento Borgia," well known to all lovers of Art, has been closed for some years to the public while the work of restoration was being carried out, and now, on the occasion of the anniversary of the Pope's coronation, it is to be opened. The Borgia Apartment was built in 1494 by Pope Alexander VI., and consists of six rooms. Five of them were painted by Pinturicchio; the first and largest was done later by Giovanni da Udine. These rooms were occupied by the Popes until the reign of Sixtus V., 1585-1590, but in Clement VII.'s time the apartment was much defaced by the soldiers of Charles, Duke of Bourbon, who were quartered here when they invaded Rome. The remains of their scribbling on the walls were till lately visible. After the apartment had ceased to be the residence of the Popes the walls were covered by bookcases, which have only been recently removed. The first room, or Hall of the Guards, which is entered from the loggia near the library, had on its walls representations of various Italian towns. These in process of time, and by bad usage, had become so much damaged that it was not possible to restore them satisfactorily; they have therefore been covered by tapestry of the period, which was removed from another part of the Vatican. Stands of old arms and armour have been placed in this room. Two of the pieces of armour are of great interest. One is that of the Constable of Bourbon, with the mark of the shot in it which caused his death. The other is the armour of Pope Julius II. Some suitable furniture has also been placed in this room, and in the others. A new pavement has been laid down—a reproduction of the old design, of which enough remains existed to enable the work to be carried out satisfactorily. In the second room, which is entirely

BY PINTURICCHIO,

as are the rest, the old design on the walls was only left in parts, and as it was not thought fitting that the great Artist's work should be interfered with, the same design has been reproduced on canvas, which now covers the walls, leaving Pinturicchio's work untouched. The third room has been partially panelled with intarsia work by Giovanni da Dolci, which was brought from the library of Sixtus IV. In the fourth room the old pavement has been reproduced by Professor Ritrosi. This pavement is of a very beautiful design, which has been admirably carried out. A few fragments of what remained of the original floor have been placed on one of the walls. The fine chimney-piece by Sansovino, formerly in the first room, has been placed here. The fifth room has a new design on the walls done by Professor Morani. The old pavement has been reproduced. In the sixth room, where the walls had no decoration before, a new design in harmony with the period has been made by Professor Frenguelli. An arch which formerly divided this room was removed by Count Vespignani. This was a most difficult matter, and it was successfully carried out. Count Vespignani has had the control of the whole work as Architect, and under him the well-known Professor Cavaliere Seitz has been charged with the supervision and direction of it. The work of restoration has been done by Professors Ritrosi, Morani, and Cingolani. The pavements were executed partly by the Museo Industriale of Naples, and partly by Cantogalli, of Florence. The restoration of this famous apartment has been carried out in a thoroughly conservative manner. Nothing has been destroyed, and only repairs absolutely necessary have been allowed. The Pope has taken the greatest interest in the progress of the work, which may well be said to be worthy of a great Pope. Great praise is due to those to whom the restoration has been intrusted—to the distinguished Architect, Count Vespignani, and to Cavaliere Seitz, to whose great Artistic knowledge and skill so much is owing, and for whose conservative treatment of the work of the great master the world of Art cannot be too grateful.

#### ST. LAWRENCE, JEWRY, AND ST. MICHAEL.

THE scheme drawn up for the union of the benefices of St. Lawrence, Jewry, and St. Michael, Bassishaw, has now been finally approved by Parliament, after having been agreed to by the Bishop of London, the patrons of the two livings, and the vestry of each parish. The scheme dates back to some few years since, when it was discovered that St. Michael's was in an insanitary condition, and that an outlay of some thousands of pounds would be necessitated to render it again available for public worship. The Church claims Wren as its Architect, but it possesses no Architectural interest, and therefore its retention from the Archaeological point of view cannot be urged. It is situated within a stone's throw of St. Lawrence, and the two parishes are contiguous, so that the amalgamation is desirable not only as judged from the standpoint of the worshippers, but as regards the geographical location of the two benefices. The proceeds of the sale of the site of St. Michael, Bassishaw, are to be applied as follows: (a) The sum of £4000 is to be transferred to the Union of Benefice Fund; (b) the sum of £4000 is to be set apart for the provision, as soon as an opportunity shall arise, of a suitable house of residence for the incumbent of the said united benefice; (c) a sum not exceeding £500 shall be allowed for putting the Church of the united benefice into complete repair. (d) The remainder of such proceeds shall be appropriated by the Ecclesiastical Commissioners towards the acquisition of a site and the erection of a new Church.

#### SOME RECENT ARCHÆOLOGICAL DISCOVERIES.

MR. FLINDERS PETRIE, in lecturing before the members of the Bradford Philosophical Society upon "Recent Discoveries in Egypt," said that two years ago, when at work near Thebes, he found to his astonishment, when excavating some graves, that they contained burials totally different from those of Egyptians, and as time went on he found that he was dealing with an altogether different race, which had forced its way into the country, and had completely ejected the native inhabitants. The results arrived at enabled them to place the advent of this race, of which nothing was previously known, at about the period 3000 to 3300 B.C. They worked in flint with marvellous skill, and Mr. Petrie showed some pictures of flint implements of a shape like the letter V. The pointed end, as was shown by one which was found entire, was inserted into the handle, and the forked end, which was chipped to a very sharp edge inside, was used to cripple the legs of antelopes, or to catch the necks of birds. Pictures of a number of curious vases, made with much skill from the hardest rocks, such as porphyry, syenite, and black granite, and without the use of any lathe or wheel, were shown as further examples of the skill of these people, but it was characteristic of them that while of great proficiency in mechanical work, they were clumsy in representing animal figures. Proceeding to deal with other excavations, Mr. Petrie showed a portrait from a well-preserved bust of Meren Ptah, son of Rameses II., and the king under whom the Exodus had generally been understood to have taken place. This had been found at Thebes, and in the same temple was a stone erected by this same king, which, in the course of a long inscription, mentioned that this king carried war into Syria, and destroyed the people of Israel—the first and only mention of the Jews or Israelites on the Egyptian monuments.

The eighth visit of this session of the day and evening Architectural students of the Glasgow Technical College was made on Saturday last to Langside Road United Presbyterian Church, by permission of Mr. J. B. Wilson, Architect. Mr. Mair, the Clerk-of-works, conducted the party and fully explained many points of interest.

## Scottish Plaster Work.

WRITTEN AND ILLUSTRATED BY R. S. LORIMER.

WITH the beginning of the sixteenth century came a change in the Architecture of Scotland. It is what might be called the beginning of the Transitional period from the Scottish style to the Renaissance and Elizabethan, which in turn gave place to the purer classic. External forms and designs of buildings were gradually altering, and we may say the same of internal arrangements, features, ornament, and detail. The towers and keeps, with nothing more than a hall and dungeons, were gradually becoming unnecessary as places of defence and security, and quite inadequate to meet the growing requirements and tastes of the country nobles of the period, hence we find drawing-rooms, reception-rooms, and galleries being added. Then came the greater necessity for decoration and ornament in all materials, wood, stone and plaster; more so plaster, I think, from the extravagant way it has been used.

We may say there was little or nothing in that way before the sixteenth century; in fact, nearly all our examples are of seventeenth century work. Of our ancient country houses nothing remains but bare walls, and in towns, modern improvements make short work of the houses where we should be likely to find something in the way of Early Decoration. The internal finishings of the early buildings were, no doubt, very simple and very far behind the highly finished dwellings in England. As Scotsmen began to have more intercourse with their English brethren, and see more of their styles and customs, the defects of their own houses became more apparent; so we find the Renaissance making its first appearance in

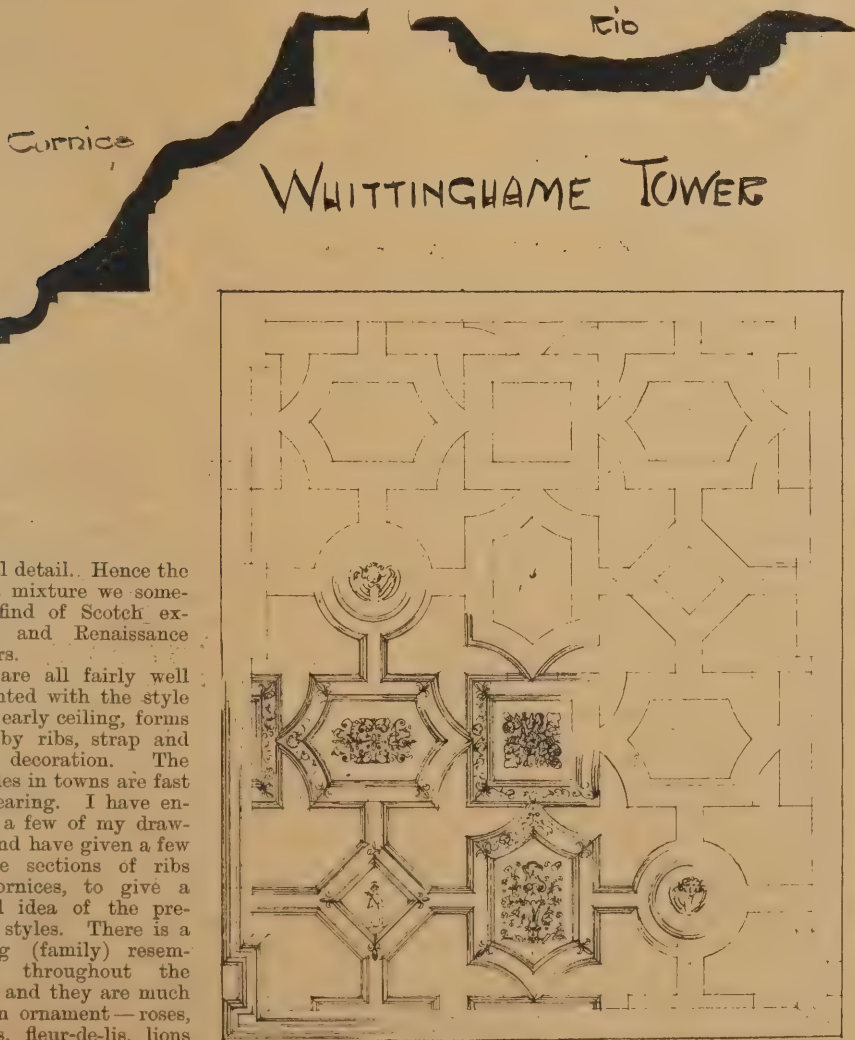

and griffins, with fruit and flowers filling in the panels.

One of the earliest examples that I illustrate

here is from an old house in Church Street, Berwick-on-Tweed. Its date is supposed to be about 1600, but that is not at all certain; at any rate, I should say that it was done before the time that rich designs and elaborate modelled work became so common as we find in the later examples of the seventeenth century. This ceiling is divided up by a plain rib of rather an uncommon section, in fact it is the only one of the kind I have seen. The ornament is simple. There are small bosses at the intersections, and leaves spring from them and spread on to the ceiling.

From Bonhard, Linlithgow, built in 1591, we get some fine examples of varied design. They are simple but refined in detail. The ribs mitre with the ceiling members of the cornice. The modelled work in the panels is very light. Small bosses and leaves form the chief decoration. Waldie, in his "History of Linlithgow," writes of a house built by the father of the man who owned Bonhard, that contained some fine stuccoed ceilings in the style prevalent during the reign of Charles I., from about 1625 onwards. On one of these ceilings there was the mask of Alexander Cornwall, a member of the family who is said to have fallen at Flodden. Masks of men such as Alexander the Great and other ancient heroes are frequently met with in panels. At Merchiston Castle, for instance, we have Alexander and David and harp.

Some good examples of seventeenth century work are to be found at Craigievar, Aberdeenshire. Billings, in his "Antiquities of Scotland," gives some very good illustrations of them. The hall is vaulted with the old barrel vault, and the central portion is groined in much the same fashion as Moray House, and all richly finished with stuccoed panelling and ornament. The upper floor bedrooms have also decorated plaster work of the same period. In the first floor room of Whittingham Tower we have another specimen of early seventeenth century ceiling. Here we have a broad rib with what was once a running enrichment in the styles, but is now almost unrecognisable with the many layers of whitewash. The panels are filled in with various devices in modelled work. They are still in good preservation, and fairly distinct. The ribs here do not mitre with the cornice, the first member of which has a deep fillet, and on this the ribs butt. I may also mention here that the

internal detail. Hence the curious mixture we sometimes find of Scotch exteriors and Renaissance interiors.

We are all fairly well acquainted with the style of the early ceiling, forms taken by ribs, strap and panel decoration. The examples in towns are fast disappearing. I have enlarged a few of my drawings, and have given a few full-size sections of ribs and cornices, to give a general idea of the prevalent styles. There is a striking (family) resemblance throughout the period, and they are much alike in ornament—roses, thistles, fleur-de-lis, lions

woodwork of this room is also good, and is probably of the same date as the ceiling, but much later than the tower itself. The door architraves have an egg and dart enrichment. The tower is still inhabited, and is well taken care of.

Glamis Castle, in Forfarshire, is also rich in plaster work. The ceilings of the hall and rooms on the first floor, east wing, were constructed by John, the tenth Earl of Strathmore, and contain his monogram and that of his Countess, and the date 1620.

In the dining-room at Rosslyn Castle we have rather a different treatment. The ceiling here is divided into panels with beams, with plain soffits and coved sides, with running enrichment. These large panels are again divided with small ribs. Relieved ornament spring from the corners. In the centre panel is a shield, with the initials of Sir William St. Clair, and the date 1622.

Pinkie House, that well-known mansion near Musselburgh, is quite a storehouse of good plaster work. Here are examples of the various ways the Artists (for Artists they must have been) treated the ceilings of the seventeenth century. We have one almost entirely covered with broad enriched ribs, with decorated pendants at the intersections, and the plain spaces that are left are filled with modelled work in the form of crescents, monograms, coronets, &c. There is a very fine drawing of this in the first volume of the "Architectural Sketch Book." In another room we have plain, narrow ribs, forming squares and circles alternately, and joined with ribs at right angles to these. Another room ceiling is entirely made up of circles, and connected with ribs running diagonally. Then the fourth example, on the same floor, is ribbed in squares, circles, and interlaced work. The modelled work in all is very similar.

I believe Carnock Castle, in Stirlingshire, contains some examples of rather a different type from those I have just described, and are quite different in detail and ornament from those at Wintoun, Pinkie, and Moray House,

and others of the same century. I am sorry I cannot describe them more fully.

Drumlanrig Castle, the Duke of Buccleuch's seat in Dumfriesshire, is well worth a visit, and should not be missed if you should happen to be in the district, and have the time and opportunity for seeing the place, not merely to strain the backs of your necks in gazing at the beautiful ceilings, but to have a good look

at the whole building. It is one of the finest examples in Scotland of a seventeenth century mansion, and it is greatly enhanced by its splendid situation. I was not an enthusiastic youth when I had the pleasure of seeing through the place, but I was greatly struck by its imposing exterior. I can tell you nothing about the ceilings, except that at the time I thought they were very grand. I daresay I might have taken more note of them if I had known that some day I should try to write about them. There is a wealth of work to measure and sketch here if permission could be obtained.

I daresay most of you are acquainted with Caroline Park. The suite of rooms on the west side are elaborately decorated with panelled plaster work. The ornament here is of particularly fine workmanship.

I will now draw your attention to Wintoun House, Haddingtonshire, which is remarkably rich in plaster detail. The drawing-room ceiling is an example of the perfection attained by the plasterers and modellers of the seventeenth century. The detail and ornament are exceedingly fine. The ribs are broad, with small lead and ogee moulding and enriched styles. The room adjoining, known as King Charles' room, is also richly plastered, and here we have the addition of moulded and decorated pendants. We have in this room, too, an example of what the ancient plasterers could do in the way of a frieze. It is made up of small decorated pilasters and arches. The spaces are filled in with vases and flowers almost identical with those in the panels of the drawing-room ceiling.

About two miles from Haddington stands Lethbridge Castle, and in it we have an example of ceiling executed in the early part of the seventeenth century, but it is in a very bad state. It is composed of narrow ribs forming squares and diamonds, with pendants at the main intersections, and connected to the ceiling with leaves. The chief ornaments in the panels are the initials I. M. S. for the Earl of Lauderdale and his wife, and winged heads.

In a room on the first floor at Merchiston Castle the ribs on the ceiling show a different treatment. They form circles and half circles next the walls, and two ribs connect them. The enlarged drawing shows the method clearly. It is on this ceiling that we have the masks of David and his harp and Alexander the Great. From the centre panel hangs a large moulded drop. Possibly some of you may have noticed from the train

MERCHISTON CASTLE.

Kellie Castle: life.

The Drawing Room Ceiling

The Centre Panel

By that pattern

The piece which exists at present is very imperfect copy having penwork over on the top of the original which was much older

Measured and drawn 1857

R. S. Lorimer

MEASURED AND DRAWN BY R. S. LORIMER.

a ruinous-looking building near Prestonpans Station. That is Wallyford, or what used to be Wallyford. It was burned down some years ago. The dining-room and ante-drawing-room had fine ceilings, with light ribs forming circles and other figures common during the period. My principal reason for taking notice of this place is to draw attention to the fine doorway, which is well worth measuring. The lintel bears the date 1672.

(To be continued).

### KEYSTONES.

THE death is announced of M. Edmond Yon, the landscape painter, who was born in Paris on March 31, 1841.

THE Marquis of Salisbury has given £30 towards the restoration of St. Laurence's Church, Blackmore. About £1300 is required.

THE erection of a Cathedral at Liverpool as a memorial of the Queen's long reign is being strongly advocated locally, and is receiving considerable support.

WE understand that the Canadian Government is about to expend \$10,000,000 in enlarging the canal system between Lake Superior and Montreal.

THE cost of the Free Gardener's new hall at Picardy Place, Edinburgh, opened recently, was £9000—£4000 having been paid for the building, and £5000 as the cost of the alterations.

MR. ALEXANDER PECKOVER, of Wisbech, has consented to lay the foundation stone of a new grammar school at Wisbech. The members of the Peckover family have contributed £3500 towards the cost of the new school.

MR. HENRY HARBEN, of Hampstead, and Warnham, Sussex, has, at a cost exceeding £50,000, erected and equipped on the sea front at Littlehampton a convalescent home, which is to be open to workmen in all parts of the country.

THE Durham Miners' Association at the collieries at South Moor, near Chester-le-Street, has determined to build a new hall at an estimated cost of between £2000 and £3000. The contract has been let to Mr. John W. Bolam, builder, Pelton.

WE understand that the more ornamental of the wrought iron gates and railings fixed at the Marylebone Public Baths, recently opened, were supplied by Thos. Brawn and Co., of 64, Clement Street, Birmingham, who obtained the order in competition.

A NEW altar has been erected in St. Mary's Roman Catholic Church, Lochee, built and fitted up by Mr. A. B. Wall, sculptor, Cheltenham. It stands about 24ft. high, having marble shafting. The altar frontal is of pure Sicilian marble.

KILRUSH House, near Kilrush, the seat of Mr. Hector Vandeleur, has been destroyed by fire. Nothing is known as to the origin of the fire, which has destroyed the whole building, with the exception of the billiard-room. The damage is stated at £30,000.

THE St. Pancras Vestry is of opinion that the most suitable way of commemorating locally the Queen's long reign would be to raise funds to assist the building of the North-West Polytechnic Institute, towards the maintenance of which, when built, the Charity Commissioners and the London County Council will contribute £5000 annually.

MESSRS. J. CHESSUM AND SONS, the contractors for the new offices for the Commissioners of Sewers, deny any knowledge of the rescinding of the building contract, and state that the works are being pushed forward to carry out a modified design rendered necessary by the injunction which restrained the erection of the building according to the original plans.

As the workmen engaged in the enlargement of Hamilton Slaughter-house were making excavations, they came upon the memorial stone of the old building. In the hermetically sealed bottle there was a parchment, finely preserved, containing the inscription:—"This Flesh Market was built in the year of our Lord One Thousand Seven Hundred and Ninety-Four, and in the Thirty-fourth year of the reign of His Majesty King George III."

### ARCHITECTURE IN RELATION TO THE HANDICRAFTS.\*

BY T. G. JACKSON, R.A.

IT used to be the fashion for anyone writing or speaking on Architecture to cite Vitruvius as the authority for what he said. The writings of Vitruvius are no longer regarded by everybody as the gospel of Architecture, and, indeed, are now perhaps rarely read by Architectural students. And yet, on the present occasion, I cannot do better than take as a text the opening passages of his treatise, which seem to apply very aptly to the subject for discussion to-night. Vitruvius distinguishes at the outset between practice and theory in Architecture, and goes on to point out that Architects who are mere handicraftsmen without literary training are unable to give any reason for what they do, while those who trust only to theory and book learning without practical training seem to grasp at a shadow, and not reality. An Architect, he says, must be properly trained in both fields. He must be both ingenious and teachable, for neither will wit without training, nor training without wit, make the perfect Artist. He must be a skilful draughtsman, a learned geometrician, not ignorant of optics, instructed in arithmetic, a good historian, and a diligent student of philosophy. He must understand music; he must know something of medicine; he must be familiar with the decisions of the lawyers; he must understand astrology and astronomy. This is a formidable programme, and if one may, without profanity, speak disrespectfully of a writer who has hitherto been considered almost sacred, one would be tempted to say he was writing nonsense. The first part of his list is, no doubt, necessary enough, and as to the latter part, when we come to his explanations, we find that they do not make so much demand on the student as at first sight they seem to do. The usefulness of his historical lore is to enable the Architect to explain the meaning of some of his ornaments, and to tell the inquirer that the figures of Caryatides which were used as columns, were derived from the matrons of Caryas, a Peloponnesian city, who were carried into slavery because their country had sided with the Persians against the Greeks.

#### PHILOSOPHY IS NEEDFUL

to him only in the same way that it is needful to everybody—to prevent him being arrogant, and make him just, honest, and temperate. As for music, he seems to require it principally for testing, by the notes they give, the strain of the ropes of catapults and military engines. His knowledge of medicine should be sufficient to guide him to avoid unwholesome sites and bad water. As for his knowledge of law, Vitruvius seems to think he ought always to be an expert in questions of party-walls, rights of drainage, and light and air. After this long enumeration of matters requisite for an Architect, Vitruvius draws the line. Pythius, the Architect of the Temple of Minerva at Priene, had said that an Architect should be able to excel in all the Arts, and in each to surpass those who made that Art their especial study. Vitruvius thinks Pythius goes a great deal too far. An Architect, he says, neither need be, nor can be, such a grammarian as Aristarchus, but he must not be unlettered; he need not be a musician like Aristoxenus, but he must not be without musical sense; nor need he be a painter like Apelles, but he must not be unskilled in drawing; nor need he be a sculptor like Myron or Polyclethus, but he must not be ignorant of the plastic Art; nor finally, has he to be a doctor like Hippocrates, but he must not be without knowledge of the laws of health; nor in other studies need he excel as a specialist, but he must not be wholly unskilled in any of them. To say that Architects should excel in all these things is to

#### DEMAND AN IMPOSSIBILITY,

because it is only now and then that a man can excel in one Art even if he pursues no other.

\* A paper read at the Architectural Association on Friday evening.

Pythius therefore is clearly wrong, and has gone astray because he has not made a proper distinction between practice and theory. Therefore, says Vitruvius, he seems to have done quite enough in these several branches of study, who has a fair knowledge of those parts and theories of them which are necessary to Architecture, so that if he should be called upon to pass judgment upon or to approve these matters and Arts he should not be found wanting. Vitruvius, therefore, waters down, as he goes on, the somewhat strong dose which at first he seems determined to administer to the student of Architecture, as a tonic necessary to his constitutional well being. A general theoretical knowledge of the various Crafts, which it will be his business to direct, sufficient familiarity with them all to prevent his passing indifferent work on the part of those who work under him, seem to be the measure of the practical acquirements necessary to an Architect, according to the

#### ROMAN AUTHORITY.

On the other hand, we have the dictum of the Greek Architect, Pythius, who says that the Architect must not only have this general theoretical knowledge, but must be actually skilled in the practice of all the Arts which he has to deal with; and not only that, but superior in each one of them to the specialist who follows only that

#### SINGLE ART.

Which of the two is to be our guide? Shall we be satisfied to be proficient in the theory of our Art, learning it from books and lectures, and merely acquainting ourselves with practical work in a general way, enough to enable us to understand our specifications, and order the work properly, and detect flagrant instances of inferior workmanship and bad material; or are we, with Pythius, to put our hands to the work ourselves, and not only design but help to execute it; to train ourselves to be Master Craftsmen as well as superintendents and directors of other men's labour? For many generations past the former of the two methods has been the order of the day. Most of us who have reached or passed middle age have been brought up under it, and if we have, to any extent, departed from it, it has been of our own initiation that we have done so. That this plan was not that in vogue during the best periods of modern European Art is well known. It was not in that way that the Architects, or building Artists of the Renaissance, in its earlier and more independent days, or those of the middle ages worked. They would have been at a loss how to go on if you had parted them from their building and their workmen, and shut them up with a drawing-board and a T square, and asked them to make their designs and convey their instructions by

#### MEANS SOLELY OF DRAWINGS.

Their method was that of Pythius rather than that of Vitruvius, whose gospel, fortunately had not in their day obtained currency, or been placed on the canon of inspired authorship. I need not tell you that of late years there has been a revulsion against what I will call the Roman method of practising Architecture in favour of the Greek. Many of us have been preaching against the strictly professional view of Architecture, and urging that a man cannot be expected to produce good designs who seldom or never comes into contact with the materials out of which his designs have to be constructed. We have argued that it is from the handling of material that suggestions in design can most readily be gathered. That reading about processes in building, or any of the Arts which go to make up a building, will never teach a man how to make the most of his opportunity, how to use his material to the best advantage, how to economise labour so as to avoid wasting it to no purpose, and how to design in accordance with the natural qualities of stone, iron, or wood with which he has to deal. We have tried to impress on the student that an hour spent in the workshop or on the scaffolding will often teach him more than a week spent in a library. We have gone still further, and tried to persuade students not only to go and see how things are done, but actually to put their

own hands to the work, and to become handicraftsmen in one or more of the many Arts with which as Architects it is incumbent on them to be familiar, and of which it is necessary the technicalities should be understood by anyone who undertakes to design for them. These proposals, however revolutionary they appear to the advocates of the old-established professional system, according to which Architecture has so long been practised among us, are still, it is clear, very far from bringing us again to the methods of the Architects of four hundred or five hundred years ago, to say nothing of those of the Greek Architect, whose demands seem to Vitruvius so extravagant. The contracts which Bishops and Chapters and others who intended building on an important scale made with their Architects bound them down rigidly to a much more constant and intimate association with their work than a modern Architect would submit to. The Architect bound himself to come with his family and live in the place where he was to build, to engage workmen, and see that they did all that was necessary to be done, to work with his own hands, both in building and in sculpturing, as befitted a good sculptor, and a master of the

#### ART OF STONE-CUTTING.

He was also to go to the quarries as often as was necessary, and arrange for the quarrying of the stone. Furthermore, he was bound for the term of so many years, during which the building was to be constructed, not to undertake any other work without the special leave of his employers, or a majority of them, or, if he were engaged on some other building in the same or a neighbouring place, the time he should devote to each was strictly specified. Finally, he bound himself to supervise as chief master builder and superintendent all the labourers, builders, master workmen, and handicraftsmen employed on the building, and to supply them with such dimensions, orders, and methods as would be required during the progress of the works. For all this he was to receive a fixed annual salary, to which was sometimes added a gown or two gowns in the year, and perhaps a house was provided for him to live in with his family. The Architect of those days, therefore, was a superior clerk of works, as we should call him, with this radical difference, that he had no master over him, sitting most of his time in an office, perhaps, one hundred miles away, directing him by the penny post what to do, and sending him drawings to show him how to do it. Imagine a modern clerk of works to have had the training of an Architect as well as that of a tradesman in one of the handicrafts; that is to say, to have the skill to design the work he directs; or, what is the same thing, imagine a modern Architect to have learned one or more of the manual trades, and to choose to go and superintend one of his own buildings as his own clerk of works, and you have the nearest approach to the Architect who designed and raised

#### THE MIGHTY STRUCTURES OF THE PAST,

which it is our aim to rival, and our despair to surpass. He would necessarily be a mason to begin with, for masonry is the king of all the trades, the one which all the rest follow, and the one which, blending itself, as it does, imperceptibly with Sculpture—which is but a refinement of masonry—passes without any visible or marked transition into the higher region of fine Art. In olden time Sculptors and Architects were the same persons, or, at least, though there were Sculptors who were not Architects, there were probably no Architects who were not Sculptors capable of designing the carved work of their buildings, and of executing the most important parts of it—notably the figure-work—with their own hands. Let us for a few minutes try to realise in our own persons what it would be like to practise Architecture after this fashion. Let us shut our eyes to the present and try to open them again in the days of, say, Henry VI. or Lorenzo de Medici. The dingy office in a London street vanishes from our sight. Away go the high stools, the drawing-boards, the dusty piles and rolls of paper, for—oh! blessed release—there will be no more working drawings to make,

and little drawing of any kind whatever. The office bell will no longer send a shock through our nerves, announcing the coming of a visitor to interrupt us at the most critical period of a design. The approach of post-time will no longer drive us into a frenzy to get off arrears of correspondence that cannot be postponed any longer, for we shall have little reason to write to anyone. Our employers will be on the spot with ourselves, and an occasional conference on the building itself will make much letter-writing unnecessary. Away, too, goes all that tedious necessity of long railway journeys which dissipate our time, and exhaust perhaps four hours in travelling for every hour we have to spend on the work at the end of it. Our work will now be all under our eyes, or near at hand, and

#### THE HOURS WASTED IN THE RAILWAY CARRIAGE

will be employed to good purpose on our growing building. Away, too, go the long specifications, the contracts with builders, the lynx-like supervision required to keep their performance up to their engagements, for we shall either be our own contractors or else have workmen under us employed and paid directly by the (our own) employer. Relieved of all these official and commercial occupations in which I venture to say most of us—do what we will—find half, and more than half, our time spent, we shall pass our working days clad in the workman's blouse, setting out our work on the ground, drawing such simple diagrams as will give the workmen the proportions and dimensions of the several parts, marking out the mason's moulds, perhaps taking the mallet and chisel out of his hand to show him practically how we want certain parts finished, trying on the building itself as we can nowhere else the scale and proper character of our sculptured ornament, without doubt doing so much of it ourselves as will give the clue to the subordinate carvers, and probably finishing some of the most important parts with our own hands. Conceive the sureness and confidence with which we should work. There would be none of that experimental and hesitating anxiety which makes us doubt after drawing out a design whether it will come out as we intend in actual execution. No! there is the building itself on which to try experiments. When the thing is going wrong we can stop it at once and correct our original device and substitute something better, and there will be

#### NO CONTRACTOR TO WORRY US.

for an *extra* on the inevitable plea that the new way is more expensive than that for which he contracted. And so our building will rise, and as it nears completion, and the scaffolding comes down, and we stand with hands behind us, and head thrown back, to see our creation as it emerges in its maiden whiteness from the enveloping veil of poles and planks, we shall feel that it is indeed our creation, the work of our own brain, and in a measure of our own hands, in a way that no Architect can quite feel now about any of his creations, however much pains he may have devoted to them. This, I venture to think, will appear in the eyes of many of you—certainly to the younger men among you in whose bosoms the stirrings of Art have all their youthful freshness—an attractive picture. Can we realise it at the present day? Or, if that is impossible, how near can we get to it? Can we get back to it? Well, of course, we cannot do it in a hurry. But can we expect ever to get back to the old system at all? I think not. It would be putting the hands of time back too far. Changes of system do not come about without some reason in the nature of things and of men, and to neglect the conditions of modern life in Art while we admit their supreme influence in other fields would be not only unpractical but unphilosophical. Take, for instance,

#### THE MATTER OF WORKING DRAWINGS.

The drawings used in olden time were of the slightest and most conventional kind. Even in Wren's time working drawings such as we make for every detail were not found necessary when competent workmen were employed.

When sending his small scale plans and directions for the library at Trinity College, Cambridge, Wren adds: "I suppose you have good masons; however, I would willingly take a further pains to give all the mouldings in great; we are scrupulous in small matters, and you must pardon us, the Architects are as great pedants as critics and heralds." In his day there were trained schools of masons and joiners who had traditions of their own, and could be trusted to apply them. The Architect gave them the size of the door, the scale and amount of ornament he wished to use in the doorcase, and the workman had sufficient skill to fill up the details of the sketch and to realise the Architect's intentions as he would have them. So with the masons: to give them the moulding in great would, Wren seems to imply, be unnecessary if the men were good Craftsmen. But where are the workmen nowadays who could be trusted to do this? It is easy to imagine the result if we tried the experiment. There are very many Architects who do try the experiment of dispensing with working drawings, not from any desire to return to the older system of work as being better, but simply from the wish to save themselves trouble, or else in order to save their time for more lucrative occupations which have little or nothing to do with Architecture. Some of them employ a ghost, and the ghost naturally takes little interest in a work which is neither his entirely, nor anybody's entirely, and the details come off badly. Others dispense with the ghost, and leave all the details to a contractor. One builder told me that when he applied to an Architect for details of a certain work, the only answer he got was, "Take it and do it, and don't bother me about it." In another case the builder told me the only full-size details furnished him by the Architect of a building which cost £6000 were those of a cellar door and a coal-shoot, and that he—the builder—himself made all the other working drawings, and did not even go through the form of showing them to the Architect. Now, I need not tell you that, whatever may have been the case in the days of Sir Christopher Wren, there is no school of workmen nowadays capable of filling in the

#### DETAILS ON A GENERAL DESIGN

given them by an Architect. Nor need I tell you that it is on the details of a design that its success depends for its ultimate appreciation no less than on the general conception; for no grandeur of idea, or originality of scheme, will make a good building if it is badly carried out in its details. An amateur may and often does have good conceptions in the mass, but it is only the Artist who can carry them out into execution successfully, because he alone is capable of contriving the parts out of which the whole general idea is built up. It may be imagined, therefore, what kind of Architecture results from the method I have described when the nominal Architect gives only the rough idea of the building, and leaves the details to men who have had no Artistic training whatever. Indeed, there is no need for imagination in the case, for the streets of London are lined with buildings erected on this system, expensive and costly buildings very frequently, for the worst modern Architecture is the most gorgeously decorated, and lavish expenditure on ornament is the last resource of an incompetent designer. But if neither builder nor workman can be trusted to supply proper details for the carrying out of an Architectural design, what conclusion is left to us but that they must be done by the Architect? How is he to supply them? Of course, he might, like the old men, go and live on the work, and give the details to the workmen by word of mouth, or by example, or by setting out the moulds and dimensions with his own hands. I do not know how many of you are prepared to follow your Craft in this way. You would only be able to look after one, or, at the most, two or three, buildings at a time, and, though you would save the expense of an office, I fear 5 per cent would not enable you to earn much more than a bare livelihood. Drawings, I fear, are, and must remain, a necessity if an Architect is to have his designs carried out as he intends, and if he wishes to

have full justice done to them. Again, there are many buildings in modern times involving

#### INTRICACIES OF PLAN

which must be carefully plotted on paper, and could be contrived in no other way. Old buildings were very simple, and in their plans there was very little variety. One manor house was arranged very like another manor house, and one Cathedral or Church on much the same general lines as another. Those buildings of our own day which retain this simplicity of plan could be built without drawings just as the old ones were. It would be easy enough to build a great Church from foundations to cap-stone of spire without a single drawing but such rough diagrams as the designer would need to enable him to put the parts of his building together. But when we come to such elaborate buildings as the modern town halls, or technical schools, or boarding houses of our public schools, or theatres, or when we have to deal with confined and scantily lighted sites, as in the streets of London, careful and elaborate plans are a necessity, and the drawing office indispensable. There is no prospect whatever of our being able to build in the future without drawings, and we may dismiss as impracticable all hope of superseding them by supervision and direction on the spot, and of being able to shut up our offices and take to the building sheds and the scaffolding. But admitting all this—acknowledging, as I fear we must, that the necessities of modern system are too strong for us, and that we must, in the main, go on as we are now doing, is there nothing we can do to place ourselves more in touch with the handicrafts? If we cannot go the whole way, may we not go part of the way to meet those workmen on a common footing with whom, whether indirectly or directly, we cannot help co-operating in the carrying out of our designs? If we cannot, as Pythius would have us, excel in all the Arts, so as to surpass in each one of them the skilled workman who has followed that one alone, and made himself master of it, surely we may, without being unreasonable, demand of our Architects that they shall at least not design things without knowing how they are to be made. Nor if it is unreasonable to ask us to be better masons, better joiners and carpenters, better smiths and better plasterers than the men who follow those callings and do nothing else, is it unreasonable to demand that every Architect should so far familiarise himself, by actual observation and inquiry, with every one of these trades, that he may know how to make designs

#### SUITABLE TO THE MATERIAL EMPLOYED,

and the way of employing it. And yet we are all our lives designing things without knowing how they are made. How is it possible for us, in our ignorance, not to give a world of unnecessary trouble to the workman, cause a deal of needless expense to our employer, and miss altogether that propriety in design which arises from proper use of material, if the proper use of it is unknown to us. Take, for instance, the case of wrought iron work. Every Architect is called upon constantly to design such simple things as railings, grills, balustrades, in that material. He draws, probably, something after good examples that he has seen; perhaps he tries to improve on them and design something new, and if he knows nothing of smiths' work except from books and drawings and such sketches as he has made of his own, the alterations he makes very likely make what was very easy into something very difficult, if not impossible; and even if the workman gets over the difficulty by some troublesome device of his own, the labour involved is thrown away, and might have been saved by a little knowledge on the part of the designer. Those who have only designed ironwork on paper, and never seen it made, would be astounded to find how very differently it was done from what might have been imagined, and how very much more simply their design might have been done by altering it a little. I wonder how many in this room have any idea how so simple a thing as the ordinary forked baluster is made, with one foot to be let into the stone for each pair

of balusters. I confess I did not know till the other day, when I wished to vary the form of a thing so as to give it a little more character, but began to doubt as I went on whether the smith could make it. So I went to the forge and had some experiments made, and found that the usual process was quite unlike what I had imagined. Another advantage of the visit was, that I was able to suggest to the smith other ways of doing it, and before we finished we had made

#### A FORKED BALUSTER IN FOUR DIFFERENT WAYS,

and found out which was the easiest and cheapest. This seemed to me an instance of the way in which designer and workman can help one another; the designer, from habit, seeing his way to fresh possibilities, while the workman, from habit, had not thought of doing anything but what he was used to. Let it be a rule, therefore, with every Architect never to design anything without knowing whether his design is practicable, and practicable according to the received traditions of the Craft concerned. But may we go no further than this? May we not require that he should be able to put his own hand to the work as a handicraftsman in one or more of the trades over which he has to exercise control in the ordinary discharge of his duties? There are some trades of which it is obvious such knowledge as an Architect can derive from observation is enough. Going through the trades in the specification according to their order, we begin with Excavator. It is, I think, obvious that he would not improve himself in Architecture by going to work in the trenches with pick, shovel, and wheelbarrow. Next comes the Bricklayer and Waller. I once built a brick wall, but I do not know that I learned much from it, except that bricklaying was not so easy as it looked, and that if it was hard to keep a true upright it was still harder to keep a true level. The bricklayer to whom I showed my wall when it was done could only say that he thought it strong, but very ugly. I do not know that I should advise any of you to follow my example. Carpentry and Joinery are more within the reach of everyone, and a course of training at the bench may safely be recommended to all who have to do with building as supremely useful. I need not go through all the trades, but Masonry brings us near to

#### THE VERY CENTRE OF ARCHITECTURE.

To be a practical mason would not in my opinion be so useful an accomplishment for an Architect as skill in joiner's work. The ordinary problems of stone-cutting can, I think, be understood without actually handling the chisel and mallet. But masonry, as I have said, melts insensibly into sculpture, and it is not always easy to say where masonry ends and sculpture begins. What will you do when you come to the carving of your building, as, of course, come you must in a building of any importance? If you only care for quantity and not for quality you can, of course, leave it, as many do, to the carver, and simply get an estimate and leave him to do his best, which in that case may also be his worst. But you will not, I am sure, if you are in earnest, be content with so perfunctory and vicarious a way of bestowing on your work its principal adornment. You will have your own notions of the scale, the character, and the finish of your carved work; you will feel that the outline of your sculptured capitals is as important as the profile of your mouldings; that the play of light and shade in your foliated stringcourse or your enriched frieze was an important element in your design; you will desire for your sculpture an historical character, illustrating the purpose and circumstances of your building; and, above all, you will feel that the same feeling which you have impressed on the purely Architectural part of your design must be carried into the sculptured decoration, or the unity of the effect will be marred. You must impress yourself on that as you have done on the rest. How are you to do this? You may spend hours standing over the Sculptor or watching him model what is afterwards to be carved, and tire both

him and yourself by suggestions and counter-suggestions which perhaps end in

#### MERE MEOCRITY AND DULNESS,

because though both of you want something different you do not want the same thing, and are unable to explain your meaning to one another. But if you were able to finger the clay yourself you could realise to yourself your own intention, and explain it to him perfectly, and in this way you would succeed in getting what you want as you can in no other. Every Architectural student, therefore, ought to learn to model. He will find it of the greatest service to him in his future career, not only in enabling him to explain his meaning to those Artists who will collaborate with him, but also in fixing and correcting his own loose ideas of sculptured decoration, and helping him to secure for it that character which will correspond to his intention. If he goes on to carve so much the better; for my part I should like to see the callings of Sculptor and Architect rolled into one. As to the other Crafts, time forbids me to speak more at length. Every man, be he Artist or not, should, as with the ancient Jews, be taught some handicraft; and to us Architects such an accomplishment would naturally be doubly useful. We cannot expect that an Architect should have actual manual experience of them all, still less can we require, with the Greek writer, that he should have mastered them all. But we have a right to demand that he shall by actual observation acquaint himself with the methods and difficulties of them all, not from books but from the workmen, not in the library but in the workshop. Let him never make a design without knowing how it will be carried out, and if in doubt let him go with it to the workshop, the building-shed, or the forge; let him consult the men who are to make it, and then correct or alter his design to suit the difficulties of material and workmanship. In this way we may expect to infuse a new life into our Architecture, and to awake it from its torpor. The knowledge you will acquire in this way will not be of a kind to be tested by examination, or to enable you to win prizes and scholarships, but you may feel assured it will be the means of making you better Artists individually, and of advancing the Art of your country as a whole.

A FUND is being raised in Croydon to build a new wing of the local hospital, in commemoration of the Diamond Jubilee.

A DESTRUCTIVE landslip has occurred at the village of St. Pierre-Liveron, near Caylus, in France. Four houses have already fallen into the valley, and the Church threatens to follow.

PROFESSOR HERKOMER, R.A., recently gave a demonstration in the Galleries of the Royal Society of British Artists of his new process for the autographic reproduction of drawings in black and white.

It has been decided to proceed with the erection of a new United Presbyterian Church and halls in Cambuslang. The site chosen is Rosebank grounds, corner of Main Street. The probable cost is stated at £7000.

At a recent meeting of the Corporation of London, the Coal, Corn, and Finance Committee reported upon the financial arrangements necessary to carry out the plans for the rebuilding of the Central Criminal Court, but the consideration of the report was adjourned, so that it might be considered with a similar report as to the enlargement of Stone Asylum.

At a public meeting in Dundee, it was stated that, although nothing had been definitely decided as to the Stevenson memorial, the Executive Committee had resolved that the memorial should take the form of a statue, a bust, or a medallion.

THE Methodists of Leeds have decided to practically reconstruct the chapel in Oxford Place. Something like £18,000 is to be spent in modernising the premises and adapting them to the needs of present-day mission work. In addition, the new buildings will afford central premises for the whole of the district. The enlargements include a synod hall, to hold some six hundred persons.

LONDON CHURCH ARCHITECTURE  
OF THE VICTORIAN ERA.\*

By T. FRANCIS BUMPUS.

Author of "London Churches Ancient and Modern,"  
"Ecclesiological Notes from North Germany," &c.

(Continued from page 108.)

THE INVENTIVE OR ORIGINAL PHASE OF THE  
GOTHIC REVIVAL.

TWO Churches, probably the noblest Architectural conceptions of their class raised during the present century, head the list of those erected in London under the second phase of the Gothic Revival—the inventive or original one—St. Matthias, Stoke Newington, and All Saints, Margaret Street. Each is by the same Architect, Mr. Butterfield; each, while belonging to the thirteenth century style of English Gothic, presents many departures from Mediæval precedent and arrangement; and each affords an example of what can be effected, not only with the costliest, but with the commonest materials when used by a master hand. The sumptuous character of All Saints, Margaret Street, caused its erection to extend over nearly ten years (1850-59). St. Matthias, on the contrary, was finished in two years, being begun in 1851 and consecrated in 1853. Few London Churches have had a more interesting or eventful history than St. Matthias, Stoke Newington. It originated during the latter part of the "forties" with a small band of North London Churchmen, who, with but a small sum at their command, and under difficulties which for a time seemed unsurmountable, succeeded in realising the idea of a town Church in its fullest essentials, carried out not only with great originality of Architectural treatment, but with correct ritualism.

## A BOLD AND ORIGINAL STEEPLE.

Probably no Church erected near London at the time attracted more attention than St. Matthias, Stoke Newington. The introduction of the "saddle-back" tower† into the streets of the Metropolis was certainly a bold experiment on the part of Mr. Butterfield, but one that was justified by its effect. There is perhaps nothing so grand in the whole range of Modern Architecture as this skilfully designed tower, rising at the east end of a lofty clerestoried nave, whose aisles are continued alongside of it in lieu of transepts. The fine proportions of this plain brick steeple, in which the sparingly introduced bands of stone form so characteristic a feature, have secured for it numerous admirers; it has outlived the hostile criticism which its novelty at first provoked; and it has, with more or less success, been adopted by other Architects. Upon entering St. Matthias, its great height (nearly 70ft.) and narrowness are most striking; this is the secret of the picturesque character which has all along distinguished Mr. Butterfield's work from others less daring in conception and, therefore, less liable to mistakes.

## GRANDEUR OF BUTTERFIELD'S WORK.

Grandeur and effect this Architect has ever aimed at, and whether he be designing a village Church or a Cathedral, he holds to those stern notions of Architectural beauty which he has made peculiarly his own. In every way St. Matthias embodies the idea dominant in its conception of a town Church, its finely-proportioned nave arcade and lofty clerestory, the noble tower arches spanning the Church transversely, its well-raised, stalled, and screened chancel, and its sanctuary—an early instance of brick vaulting—being the elements mainly conducive to this result. Perhaps one of the most interesting features of St. Matthias, Stoke Newington, is its nave roof. Of a simple cradle type, it strongly calls to mind that of Ely Cathedral before Mr. Le Strange took its painting in hand. Another feature is the absence of elaborate decoration in stone or wood carving. The former exists

only in the caps of the corbelled pillars supporting the tower, in the sedilia, and in the dripstones of the great east window. The glass which fills this last is by Wailes, and, owing to the cold grey which forms a background to the figures, must be pronounced one of the most satisfactory works produced by that Artist, thanks to Butterfield's superintendence. The small western window of either aisle—also by Wailes—is very good, but by far the finest in the Church, albeit desiderating grisaille work, is the great one above the west door, with its Old Testament figures, by O'Connor. A very peculiar feature of this window is the buttress which is carried up it in lieu of a central light—doubtless suggested to Mr. Butterfield by the east end of the Abbey Church of Dorchester, which, at the time of the erection of St. Matthias, he was engaged in restoring. Those of you who may chance to visit this remarkable Church should not omit to observe the grand effect produced by the two great tower arches from about midway up the south aisle, as well as from the extreme west end of the Church.

THE ECCLESIOLOGICAL SOCIETY'S "MODEL"  
CHURCH.

All Saint's, Margaret Street, if it were not quite that model Church dreamed of by the early ecclesiologists, was at least the nearest approach to that ideal which the ecclesiological movement had up to the period of its completion, in 1859, produced. Without vitiating in the least our beautiful Decorated style, Mr. Butterfield in All Saints overstepped the mere repetition of conventional forms, to produce a building in which a free eclectic manipulation of parts was grafted upon a system of polychromatic construction, having its basis in the fact that London is naturally a brick town. The choice of site for this Church was unfortunate, feelings of sentiment having been allowed to prevail; but in spite of its cramped area, that vigour and originality of construction inseparably connected with every work undertaken by Mr. Butterfield is everywhere exhibited in this sumptuous work, from the nobly-proportioned tower and spire, immeasurably grander than the steeples of the Marien Kirche at Lübeck, to the carving of the delicate alabaster capitals of the clustered columns of the nave arcade, carving which had the honour of extracting from Mr. Ruskin a high eulogium, but not higher than it deserved for combined boldness and grace. The magnificent western window was made, as we now see it, not many years ago by Gibbs; the original window, by Gerente, a very, I may say too faithful, copy of the celebrated Jesse window at the east end of Wells Cathedral, not giving satisfaction. I am, however, happy to say that the same idea has been preserved, and this western window of All Saints may now be ranked among the finest in the kingdom.

## DIFFERENT SCHOOLS OF MURAL DECORATION.

The contiguity of houses to the east end of All Saints, Margaret Street, prevented its being pierced with a window—a defect neutralised by the scope it afforded to the pencil of Dyce, whose delicate and frequently restored frescoes, carried out in the German *heilige* style, form a welcome relief from the Archaic surroundings. At St. Alban's, Holborn, which forms, if I may so speak, a *via media* between the dignified severity of St. Matthias and the gorgeousness of All Saints, the same accident—confined situation—has been likewise neutralised, but by that series of paintings on water-glass with which the genius of Le Strange and Preedy covered the east wall like a gigantic reredos.\* In feeling, these paintings at St. Alban's are the antipodes of those at All Saints, being treated, as far as the style of drawing is concerned, very Archaically. A very happy medium between these two schools was struck by Mr. Holiday about five-and-twenty years ago in the two frescoes executed by him upon the wall on either side of the reredos at All Saints, Notting Hill, one of the largest and most important works of Mr. Wm. White, and

highly deserving of careful examination by the ecclesiologist. It is a work of great power, combined with a certain amount of originality, though very English in its details, and contains a reredos of singular beauty from the chisel of Redfern. But to return to St. Alban's. The chief beauty of this Church, internally, resides in its grand proportions. Its nave arcade is peculiarly graceful, the piers being genuine specimens of Early Decorated work. Butterfield excelled in the arches opening from his naves into his chancels; those in St. Matthias, St. Alban's, and All Saints being among the finest things in the whole range of modern English Architecture. No good general view of St. Alban's is obtainable outside, a defect it shares in common with All Saints, St. Clement's (City Road), and St. Augustine's (Queen's Gate), a truly noble and sumptuous work, considered by many to be Mr. Butterfield's most original work, and belonging to that style of highly-enriched mural decoration which he developed during the latter part of the "sixties," as exemplified in the chapel of Keble College, Oxford.

## WORKS OF MR. BUTTERFIELD.

Both St. Alban's and St. Augustine's (Queen's Gate) being exceedingly broad and lofty, the Architect has been enabled to invest their western façades with more than ordinary grandeur and majesty. We have seen how pleased Mr. Butterfield was with his experiment of a "saddle-back" tower at Stoke Newington, and this led him to adopt it again at St. Alban's. Here the tower, being much broader from N. to S. than from E. to W., has, I always think, more the appearance of a prolongation upwards of the west front than an actual steeple, but there is something very striking and Minster-like about the mass, which is augmented by the cleverly contrived octagonal belfry turret and the transepts, which, like those in some of the old Rhenish Churches, project from either side of the west front, forming internally a narthex after the fashion of that gigantic one at Peterborough, the noblest Romanesque building on this side of the Alps. At St. Augustine's, Queen's Gate, Mr. Butterfield seems to have been induced to cast his western façade into the form of one of those huge quadrangular belfries met with in the South of France, in the neighbourhood of Toulouse. Probably no Church built by him gives one a better idea of the manner in which the Architect values the aid of colour than St. Augustine's, Queen's Gate. Its interior is unquestionably the noblest in the West of London, deriving its impressive effect from the manner in which every detail has been left to the supervision of the Architect. To some of these exception may be taken, but I have not time, nor is this the place to point them out. With the Churches of Mr. Butterfield may be classed the only London work of his pupil, the late Mr. Henry Woodyer, who, like his master, while infusing great originality into certain details and avoiding stereotyped and common place forms, has never deviated from our national forms of Middle Pointed. One of

## A NOBLE GROUP OF CHURCHES,

is St. Augustine's, York Street, Hackney Road, a plain brick structure consecrated in 1867, and designed, like the same Architect's Church of the Holy Trinity, Winchester, with a nave and chancel both clerestoried, and contained under one line of roof. Probably from fear of committing either himself or his patrons, this work of Mr. Woodyer's at Haggerston, although abounding in vigour and originality, is neither so stately nor so abnormal as some he has designed, notably the fine pile of collegiate buildings erected by him for the late Sir Frederick Gore Ouseley at Tenbury. The reredos in St. Augustine's is one of the loveliest works of the kind in England. While on the subject of reredoses I would call your attention to that in All Saints, Stoke Newington—one of a series of Churches built in the North and North-Eastern suburbs from the designs of Mr. Francis Dollman, and all of them exhibiting much genius and power, not without considerable originality. But to return to St. August-

\* A paper recently read before the Toynbee Architectural Society.

† The Tower forms the chancel on the ground-plan, a short sanctuary projecting beyond.

\* An elaborate and costly reredos is now in course of erection at St. Alban's.

tine's, Haggerston. This Church is one of a group in the same district, all lying so close together that from the tower of one the rest is clearly seen, all from the hand of the same Architect, and all exceptionally grand specimens of town Churches, in which the characteristics betrayed are dignity and repose, a decided penchant for Early French detail, a tendency at times to abnormal outlines; simplicity of material; absence of elaborate detail—in short, all those features so essential in Churches built for a stately ritual, and planted in poor and thickly-populated districts.\* The Architect of this striking group was Mr. James Brooks, and of them it is not too much to say they are the most remarkable erected in London under the "inventive" phase of the Revival. Their names are: St. Michael, Shoreditch (Mark Street, Finsbury), finished in 1865; St. Saviour, Hoxton, near the Rosemary Branch Bridge (completed 1866); St. Chad, Nichol Square, Hackney Road, and St. Columba, Kingsland Road, both consecrated in 1869. To this group may be added St. Andrew, Plaistow, which followed a year later. I should much like to enter into a detailed account of these noble Churches, but as I still have a deal of ground to get over, their leading features must be sketched as briefly as possible. St. Michael's, Shoreditch, is a most stately Church, very lofty and very long, but unfortunately so hemmed in by tall model lodging-houses that no really good general view is obtainable; but the east end, seen from the north, tells to great advantage, as does the grand mass of roof, which here, as well as in all Mr. Brooks' Churches, is planned with the greatest and most Artistic ability

#### WORKS OF MR. JAS. BROOKS, 1860-1870.

The small octagonal spirelet on the gable between the nave and the chancel is both charming and appropriate, supplying, *pro tanto*, the want of a tower and spire. The fine group of buildings to the west is the Hospital of St. Mary of the Cross, the joint work of Brooks and Seddon. In St. Saviour's, Hoxton, we have a lofty first-pointed building, yellow brick outside and red within, consisting of a clerestoried nave and chancel contained under one continuous roof, lighted by tall lancets, and terminating in a very bold semi-circular apse. The site was unfortunately cramped, but the Church is well placed, and towers grandly above the mean houses of the vicinity. Undeniably imposing is the west end, with its large plate-traceried window, recalling the "Dean's Eye" in the north transept of Lincoln Cathedral. St. Chad's, Haggerston, is built of red brick throughout, with, of course, stone for the dressing, and is cruciform in plan, with an apsidal chancel, a chancel chapel also apsidal, transept and nave, with a lean-to western narthex. The four nobly-planned roofs, meeting at a simple but effective slate spirelet, impart an air of great majesty to the pile, viewed from the north-east. The transepts do not project beyond the aisles, but this is no detriment to the general effect. The vaulting of the choir and the side chapel in red brick with stone ribs is undoubtedly a masterpiece of genius. St. Columba's is also cruciform. Here, a low unfinished tower rises at the crux which, as well as the short square-ended sanctuary and transepts, is groined in red brick. Owing to its great height, length, and unencumbered area the interior of St. Columba's, Kingsland Road, is most impressive on first entering. At St. Chad's the piers are circular ones, very short and thick, with, as yet, uncarved capitals; at St. Columba's they are taller and composed of a cylinder, round which four slender shafts are disposed. Here, again, much of the carving is *en bloc*, but a beginning of carving is, I am glad to see, being made. Other features of this remarkable Church are the huge plate-traceried windows of two simple lancets and a circle, lighting the transepts and clerestory, as at St. Chad's; the open arcade above the arch opening into the north-west transept; the bold fenestration of the west end by a

double tier of lancets; the narrow aisles spanned by half-arches of brick at the interval of each bay; and the dignified flights of steps leading from the chancel to the sanctuary. The name of Mr. Brooks, the Architect of this fine group of Churches, had been brought prominently before the Architectural public in 1861, by the extremely clever manner in which he had remodelled the Parish Church of St. Mary's, Haggerston, a specimen of the "Commissioners' Gothic," with a laughable tower, concerning which all sorts of absurd tales were afloat at the period of its erection in 1828. Although these remarkable Churches of Mr. Brooks do not show a thorough conversion on his part to the principles of Continental Gothic, yet they have a very un-English look. Indeed, many of the details are reminiscent of Churches in that enchanted ground to the ecclesiologist—the North-Eastern part of France—I mean the Valley of the Oise between Beauvais and Paris; round about Soissons, Châlons-sur-Marne and their vicinity. Having occasion lately to revisit St. Columba's, I was much struck with the similarity between the arrangement of its east end and that of the Church of St. Honorine, at Gravelle, near Havre; though, doubtless, it will recall to some the same part of St. Cross at Winchester.

#### INTRODUCTION OF A FOREIGN ELEMENT.

This introduction of a foreign element into the plans and details of many an English Church before the "fifties" were very far advanced, forms a very important sub-division in the second phase of the Revival. In the hands of men like Scott, Street, Brooks, Bodley, Burges, and Pearson, who were sure of their tools, this was all very well, but, like everything else, it was carried to excess, and in unskilful hands many of the Churches in which a foreign type of Gothic was introduced became rampantly extravagant, and in some instances quite grotesque. Several causes led to this infusion of Continental Architecture with our own, and these I will sketch as concisely as I can. First, the publication of Rev. Benjamin Webb's "Continental Ecclesiology," of Ruskin's "Stones of Venice" and the "Seven Lamps of Architecture," of Street's "Brick and Marble of North Italy," and of Viollet Le Duc's exhaustive "Dictionnaire Raisonné." Secondly, the competition of 1855 open to the Architects of Europe for the erection of a Church at Lille,\* in which, by the way, two English Architects, Clutton and Burges, carried off the first prize; Mr. Street the second. Thirdly, the increased facilities for foreign travel. Nothing can be more delightful or instructive than a tour through those countries which contain the best examples of Church Architecture. It is no wonder, therefore, that so many Architects, forsaking the glories of Beverley, Lincoln, York, Wells, Ely, and Gloucester, should have returned with sketch-books enriched and their minds stored with many a charming detail from Chartres, Soissons, Dijon or Auxerre; Parma, Modena or Ferrara; Münster, Soest, Lübeck or Erfurt, which they sought to engraft upon our insular forms.

#### TWO GRACEFUL WORKS OF SIR G. G. SCOTT.

This study of foreign Gothic, due to the causes I have just enumerated, had sensibly affected our national Architecture as early as 1854, when Sir G. G. Scott drew the plans for his beautiful Church of St. Andrew, Ashley Place, Westminster, and a little later for a larger Church of similar character, viz., St. Mary, Stoke Newington. Although these two buildings are not distinctly English in their character, there is nothing in either of them that suggests a thorough conversion on the part of their Architect to the principles of Continental Gothic. It was at first hoped that St. Andrew's, Westminster, might be erected on a scale more worthy of its position, but, though munificently supported in various quarters, the general contributions, much to the regret of those who saw the exuberance and fancy characterising the original drawings—were so scanty as to neces-

sitate the adoption of a comparatively humble design. But while sacrificing richness and magnificence, Scott was enabled to attain a certain degree of boldness and novelty by adopting the half-Belgian, half-German idea of a nave and aisles of the same height, separated by a row of tall cylindrical pillars with boldly-foliaged caps, like those in the Cathedral of Châlons-sur-Marne, a city in which many delightful hours have been spent. Tall three-light windows placed under separate gables, and a slender flèche at the junction of the nave and choir, succeeded in imparting to the pile an air of great dignity, dwarfed, however, by the hideous block of houses facing the Church in Ashley Place.\* Inside there is no rival to distract attention from its positive proportions; accordingly the Church pleases by its breadth and repose. There are few London Churches in which a profusion of bright and graceful colours would be more in place. The circular pillars and luxuriant capitals are a peculiarly advantageous field for the display of pronounced hues, while the apse—which contains three lovely specimens of Clayton and Bell's work in stained glass—admits of the richest polychrome. Some *instrumenta* have been added within the last ten years from the designs of Mr. J. Oldrid Scott. In St. Mary's, Stoke Newington, Scott carried out the same idea on a larger scale, with the addition of transepts and a western steeple.† The great beauty of proportion, elegance of detail, and extreme magnitude of Stoke Newington Church places its interior among the most noble and imposing of the modern Churches in the kingdom. Few have so graceful a nave, while the chancel, terminating in a three-sided apse—in which, by the way, as at St. Andrew's, we desiderate a groin—is inferior to none in richness of carved ornament; in this respect it forms a most striking contrast to Butterfield's severe St. Matthias, in the same parish. The Church contains a great quantity of painted glass, but little of it rises above mediocrity. Clayton and Bell's windows in the sanctuary derive their excellent effect from uniformity of design less than from any peculiar grace of grouping or colour. But I must call your attention more particularly to the small trefoil lancets lighting the clerestory of the transepts, also by Clayton and Bell. Here the figures of the Evangelists stand out in bright tinctures against a background of grisaille. This glass, superintended by Sir G. G. Scott himself, is of the kind he wished to see adopted throughout the Church.

#### A THOROUGHLY UN-ENGLISH CHURCH.

But no two Churches revolted from English precedent more entirely than those I am about briefly to introduce to your notice for a few moments. In St. James-the-Less, Upper Garden Street, Westminster, the late Mr. Street was enabled—aided by splendid individual munificence—to rear a structure most sumptuous in its materials, and thoroughly North Italian in its character. Built just after the Architect had uttered his love for North Italian Art in his "Brick and Marble,"‡ it may, in some respects, be compared with Butterfield's equally sumptuous Church in Margaret Street, with this difference, viz., that whereas in All Saints the Architect has clung tenaciously to English detail, Street, at St. James's, cast aside insular traditions altogether. Time does not permit me to descant upon the many beautiful points of detail in St. James-the-Less, but I cannot leave it without noticing the vaulted chancel, a perfect triumph of the modern Architect, and the detached campanile, a lovely creation, lifting its head, *sicut lilium excelsum*, above the mean houses of the vicinity.

(To be continued.)

\* The general features of this elegant Church recall very vividly the lofty unclerestoried structure raised by the Preaching Orders in various German cities.

† Left unfinished at the time of the Church's consecration in 1858, but completed from the designs of Mr. J. Oldrid Scott seven years ago.

‡ After his Essays in North Italian Pointed, as illustrated by this Church, and also that of St. Philip and James, Oxford, Mr. Street returned to English types, as seen in the lovely Church of Taddington, Gloucestershire.

\* Occupying the site of humble mission buildings, these stately and abnormal Churches owe their erection in a great measure to the untiring exertions of that single-hearted layman Robert Brett.

\* Notre Dame de la Treille, of which only the lower part of the choir and its substructure is at present a fait accompli. A Lillois Architect was ultimately chosen.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

April 7th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AN interesting experiment is about to be tried by the Vestry of St. Leonard's, Shoreditch. Their new works for the destruction of the parish dust and refuse are to be specially designed to generate electricity for light and power. It is also arranged that baths and washhouses shall also be served by these same dust-destroying furnaces, that a public library shall be heated, and that the parish drains shall to some extent be ventilated. The cost is estimated at about £63,000. In this new Shoreditch establishment will be included a system of thermal storage, as well as an electrical reserve by means of accumulators. These are necessitated by the immense fluctuations in the demand that must necessarily be made by a large parish like Shoreditch. While business is in full swing after dark there will be twenty times as much demand for electric current, both for light and for motive power than there will be at other periods in the twenty-four hours, but of course it is impracticable to vary the generation of furnace heat by the burning of refuse to anything like this extent. It is arranged, therefore, that furnaces and engines shall be kept steadily going day and night all the year round, thus producing a steam pressure of about 100,000lb. With the appliances for storing heat and current it is calculated that the utmost extremes will be amply provided for.

THE foundation stone of the Museum of Egyptian Antiquities, which is to be erected to the north of the Kasr-el-Nil Barracks, Cairo, was laid on the 31st ult. The Minister of Public Works stated that two museums were being constructed, one for ancient monuments and the other for Arabic art. The Khedive, in the course of his speech, said that for a century scientists had been occupied in collecting monuments relating to the ancient Egyptians, and now the Government had decided upon building a resting-place for these relics. He was delighted to lay the foundation stone in the presence of the representatives of civilisation, science, and Art, and was happy to continue the work which had been commenced by his predecessors. The site of the museum covers 13,000 metres, and the cost of the edifice will be £110,000. This work is to be completed within twenty-six months from designs prepared by a French Architect.

At the Central School of Arts, Regent Street, there was recently opened an exhibition of selected works from the studies submitted in competition for the Art Scholarships of the London County Council, held for the encouragement of Art in handicrafts. The County Council offer 150 scholarships, varying in value from £20 for three years to £5 for two years, with free tuition at any approved School of Art in the Metropolis. From forty schools or more students have entered the competitions. The object of the County Council is not to make Academicians, but to train builders and decorators, carvers, glass stainers, and metal-workers, who will make our towns attractive

rather than fill our picture galleries. Most of the students are already engaged in these crafts by day. In the evening they attend classes in the cause of Art and Crafts. Some interesting specimens of sgraffito, otherwise scratching work, are shown by plasterer students from Battersea. Two layers of plaster, one red, the other yellow, are laid on, and while the yellow is still moist it is scratched away on the lines of the design. Gesso work, which has been obsolete for many years, has been revived, and there are some interesting specimens of it. It is a cross between painting and modelling. A mixture of whitening and glue is painted on with a brush and sets rapidly. Most of the pictorial designs are archaic, and on the flat plane, but there is modern humour in a series of horse sketches.

PROPERTY or building land in the vicinity of Newcastle is very valuable at the present time. A resident in the West End of Newcastle, who lives in his own house, recently put up his house for sale, thinking that he would rent a larger one, as he needed more accommodation. He made enquires in various parts for such a house as he wanted, but was unable to find one vacant, and ultimately was obliged to withdraw his own house from the market so that he might still have a sheltering roof under which to rest. At a certain country village not many miles out of the city, house accommodation is equally scarce, and the agent of the owner of considerable land in the village and its vicinity declined to entertain any proposals for building unless it was certain that the outlay would return a minimum interest of 7½ per cent. On the new building estate at West Jesmond many houses that were being built as a speculation were snapped up by eager purchasers before the foundations were completed.

CONTROVERSY as to the completion of South Kensington Museum still rages. A correspondent writes to the Times as follows:—"On Friday last Mr. Lough asked the Chancellor of the Exchequer in the House of Commons whether the Government would bring in a Bill, similar to the Military Works (Loan) Bill, for completing the South Kensington Museum by means of a loan repayable in thirty years. The reply was in the negative. Let us see what this means. The estimate of 1891 for completing the Museum was £400,000. Taking interest and sinking fund into account, this would mean about £20,000 a year—i.e., a one-thousandth part of this year's Navy Estimates—for thirty years. The excuse given—the proposed erection of new public offices in London—might be accepted but for the facts (1) that there always has been and always will be some plausible pretext why this particular project should be postponed; (2) that the proposed public offices will take many years to build; (3) that there is no hint that the South Kensington Museum will even then be taken in hand; (4) that the national finances are in a flourishing condition—if rumour is correct, the surplus which will at the end of this month go to reduce the National Debt would complete the Museum three times over. Moreover, it is not as if the entire Museum had to be built. Half of it is there already, as anyone may see for themselves who will go and compare the very interesting model of Major-General Scott's original design (which is to be found near the main staircase there) with the buildings already erected; in fact, a great deal might be done with £200,000, leaving the final completion for a later date if necessary. I do not think that those who merely come up to town for a part of the year, and who look upon London, perhaps, as a necessary evil and a wilderness of bricks and mortar, realise that those for whom London is home, and who take a keen interest and pride in the improvement and beautifying of the Metropolis, may resent a disgraceful eyesore like that at South Kensington just as deeply as the former would resent, let us say, the erection of a South Kensington Museum in its present form in full view of their drawing-room windows in the country."

THE Royal Society of British Artists' Exhibition of Paintings and Drawings, which opened last week at the Suffolk Street Galleries, Pall Mall, is characterised by its customary tolerance of the old forms and methods side by side with the eccentricities and experiments of a later growth. Here and there the influence of Mr. Whistler's reign over the British Artists still faintly lingers, and with this there is an occasional suggestion of the modern Dutch painters, as well as examples of the various kinds of impressionism and naturalism that gave birth to the New English Art Club. Amongst the larger works in the central room, a cottage interior by Mr. R. Gemmell Hutchinson, entitled "When Winds are Howling," tells the old, sad story of anxious watchers while the storm rages at sea, and there is but scant hope for the fisherman's return. Another pathetic subject on the same wall is "A Mother's Prayer," by Mr. Greville Morris, representing a peasant woman at the bedside of her dying baby. Above a picture of the "Baptistry of Siena Cathedral," from the untiring hand of the President, Mr. Wyke Bayliss, hangs an effective study of waves, "Evening Grey," by Mr. Ayerst Ingram; and a fine piece of portrait painting is a three-quarter length of "Amy, daughter of Walter Scarborough," by Mr. G. Hillyard Swinstead. Mr. Edmund Fuller renders the movement of sea and the warmth of reflected light, as well as the spaciousness of sky, in his painting of a steamer lending a friendly hand to a disabled vessel, "In Tow," and in a more pensive, imaginative manner is Mr. Arthur Meade's "Early Twilight," pervaded by a tone of ethereal blue. A pleasant air of tranquility will be found in Mr. Noble Barlow's "Dorset Meadows." In this same gallery are several impressions of light and colour which make one look below the line or beyond some of the more prominent canvasses.

A CONTEMPORARY asks why the City should not have an Art gallery worthy of the Corporation? The nucleus of a gallery exists already. What is needed is a building for its reception and for the adequate housing of future acquisitions which would certainly come in due course by gift or bequest. Here, for example, is the munificent offer of Mr. Henry Clarke, who has promised to present a picture of the value of one thousand guineas illustrative of the most striking incident in connection with Her Majesty's forthcoming visit to the City. Why should the City not recognise the unique event of the Diamond Jubilee by taking another step in advance, and providing a suitable building, say, on the Embankment, to receive the pictures in existence and those which would quickly be forthcoming?

OLD property in Carlisle is just now coming down on all sides. A block of quaint-looking shop property near the Town Hall, which yielded a rental of several hundred pounds a year to the Corporation, has just been demolished in order that the area might be laid to the Market Place, which now affords an uninterrupted view of the ancient Guild Hall as well as the Town Hall, and has improved the approaches to two of the principal streets in the city. Bit by bit old buildings in the Market Place have been removed, but the work of improvement has necessarily been very slow. The old Commercial News Room, long defunct, had its habitat in the block now demolished. The Shambles at one time occupied a site in the Market Place, and, being formed of wood and covered with slates, had a grotesque and antique appearance. They were bought by the Corporation and removed; and another important building, the city guardhouse, was similarly dealt with long afterwards, but within the memory of the people now living. When the latter was demolished, "it was hoped that the old buildings adjoining" would soon be swept away; and this has now been done, leaving a very wide area in the heart of the city.

AN exhibition of Scottish Art, in the Scottish Gallery, 127A, George Street, Edinburgh, opened a few days ago. The collection comprises nearly two hundred pictures representative of Scottish Artists recently dead,

examples of the best of living Artists, and also of the younger Artists who are already securing a name for themselves as painters in one or other of the departments. Among the pictures of those now dead, perhaps the most attractive is that of G. Paul Chalmers, entitled "Running Water," a scene on the Esk near Edzell. It is a large canvas, showing in the foreground a reach of broken water remarkably true in colouring and feeling after movement, and above it, still water overshadowed by a group of trees. There is a capital example of Robert Herdman, R.S.A., in "A Scottish Rose," representing a young woman in pale green short gown and red skirt looking pensive, and holding a rose in her hand. "The Lawyer and Hudibras" is a capital example by Sir William Fettes Douglas, the late President of the R.S.A. Horatio McCulloch is represented by an exquisite little picture entitled "Cloud-land and Moorland." Close beside it may be mentioned Orchardson's "Testing the Blade," a bold and strong example of composition and colouring. There are two charming works by M'Taggart in seascapes with children, entitled "Mist Rising in Machrihanish Bay" and "A Silken Sea," a scene at the south end of the Mull of Kintyre. Hugh Cameron, R.S.A., has several examples remarkable for their harmony of colour. Robert McGregor, R.S.A., has two French scenes which in refinement and scheme of grouping indicate an improvement on his previous work; and there are also noteworthy pictures by J. Lawton Wingate, Erskine Nicol, G. W. Johnstone, John Smart, &c.

A DISCOVERY which has taken place in Paris apparently throws some light on the "Parc aux Cerfs" of Louis XV. of France, the site of which has up to the present been doubtful. A Paris Architect, named Triboulet, who is superintending the construction of houses in Rue de la Pepinière, which formerly formed a portion of the Royal domains, has discovered a trench  $7\frac{1}{2}$  yards long and 5 yards wide, and of a depth at present unknown. This trench is filled with the skeletons of deer, which have been packed as methodically and closely as sardines in a tin, the head of each alternate skeleton being placed towards the tail of the next. The horns have been removed, but with that exception the skeletons are perfect. Each row is separated with a layer of lime. Perfect casts of the heads are to be found in this lime layer. This curious discovery is now being investigated by the Archæologists of Paris.

WE are informed that the council of the Institution of Naval Architects has arranged that that body shall celebrate the Diamond Jubilee by holding an International Congress of Naval Architects and Marine Engineers, at the Imperial Institute, in the course of the summer. The Prince of Wales has consented to act as honorary president of the Congress, and will deliver a speech on the opening day. Invitations to take part in the gathering have been sent to the Ministers of Marine of all the principal maritime powers of the world, to the French Association Technique Maritime, and to the American Society of Naval Architects and Marine Engineers, which are institutions having kindred objects to our own. The holding of this Congress will give the members a fitting opportunity for welcoming to our country the many friends from abroad who, during the last two years, have shown such marked hospitality, and done so much for the advancement of the institution. The exact date is not yet fixed, but the meetings will probably take place early in July.

It is not generally known that the oldest mummy in the world is preserved in the Museum of the College of Surgeons, Lincoln's Inn-fields. This mummy is supposed to represent the mortal remains of a man named Ra-hotep, who lived in the days of the Pyramid builders, about 3600 B.C., and whose tomb is still to be seen near the Pyramid of Meidoum. The outlines of the eyes, mouth, and ears have been traced in black paint or ink on the outside covering of the face, while the nose can be clearly traced through the bandage.

THE monument erected to the memory of the late Bishop Atlay in the north transept of Hereford Cathedral has been unveiled by the Bishop of Gloucester and Bristol. The monument cost £800. It consists of a recumbent life-size figure of Bishop Atlay, in carrara marble, laid upon a cenotaph of Belgian marble, the height of the whole being 4ft. 9in. It rests on a base of Belgian black marble, upon which is a plinth of Belgian rouge royal marble. The cenotaph, or body of the structure, is of cream coloured Belgian marble, shaped into panels, with little columns of rouge marble. A mitre is carved on the west end panel of the cenotaph, and on the east panel a shield presenting the Atlay arms and the arms of the see of Hereford impaled. In the north transept are also the tombs of Bishop Cantelupe and Bishop Aquablanca.

AN interesting discovery has just been made at Hartshill, on the great Roman road running from London to Chester. The Romans established, at intervals, numerous statistics. One such station, Manduessedum, fell within the county of Warwick, and is now occupied by the village of Mancetter. Since 1773 there have been numerous discoveries indicative of the Roman occupation. About four years ago a Roman kiln was discovered, but the importance of the discovery was not realised until too late, and the work was too much destroyed to be of value or allow of a systematic examination. A few days ago, on the other side of the roadway, at what was known as the Caldecote Quarries, a second kiln was found, and in the uncovering very little damage was done. Other indications led to a careful search, and a third kiln, in a wonderful state of preservation, was unearthed. A quantity of pottery remains has been found, chiefly of the dark-blue slate colour, including a perfect specimen of a cinerary urn, about 5in. high. The kilns, which were discovered about 16in. below the turf, are oval in form, and about 48in. by 60in.

AN American contemporary informs us that the plans of Mr. S. S. Beman, Architect, of Chicago, for a silver palace for the Trans-mississippi Exposition, have been accepted. This palace is to be the most imposing feature of the Exposition, and the central figure in a portion of the grounds to be called El Dorado. The building is to be 400ft. square, surmounted with mammoth ornamental towers, and the entire structure will be covered with rolled silver, which will reflect the dazzling glories of the rising and setting sun. The silver to be used in its external covering will be contributed by the miners of the Great West. It will be arranged in the form of a square, with open arcades and loggias at each story, similar to the Venetian palace. The corners will be adorned with octagonal towers, terminating with spires and pinnacles covered with the shining metal.

MAJOR MARINDIN has officially inspected the Highgate Hill Cable Tramway on behalf of the Board of Trade. The original cost of constructing this line, which was the first cable tramway laid down in England, was £60,000. It is now four years since the cars ceased running, but it is thought that the venture, on which £4000 has just been spent, will prove financially successful, seeing that vast numbers of persons constantly visit Waterlow Park, near the summit of the hill, in addition to the ordinary residents who have to ascend the steep incline. The large engines in the dépôt at the top of the hill have been thoroughly overhauled, and a new steel cable, the cost of which was over £200, has been put down.

FOR Diamond Jubilee Day a grand stand will, by the Queen's directions, be erected inside the great gates at Buckingham Palace for members of the Household and their friends. Stands will also be erected by the Office of Works on each side of the central entrance of the National Gallery in Trafalgar Square, and on the terrace opposite the Gallery. In building these stands at the National Gallery

and on Trafalgar Square the Office of Works is following the precedent set when the grand stand opposite the Imperial Institute was provided to enable privileged persons to see Her Majesty going to open that building. St. James's Street will be elaborately decorated. Some of the West End houses, in view of the demand there will be for workmen later on, have arranged to get their proposed seats and balconies ready so that when the Jubilee week arrives a couple of hours may suffice to put the timbers together. Preliminary work of the kind was in progress last week opposite Marlborough House, where a whole frontage was fitted up with tiers of seats. Each board was then marked for its place and afterwards stored away.

IN memory of the Rev. Canon Humphrey Cholmeley, a memorial window has just been unveiled and presented to the Church of St. Mary and All Saints by Sir Edward Lawson. The window—which is an admirable piece of Artistic work, designed and carried out by Mr. Comper—symbolises in its central light the Canon's connection with Magdalen College, Oxford, the property of which the living became in 1705. The left-hand light indicates his family connection with the county of Lincoln, and the right-hand light suggests Canon Cholmeley's association with the diocese of Salisbury, he having been made Prebendary of Bedminster and Redcliffe in Salisbury Cathedral in 1882.

THE German national monument to William I., unveiled by the Emperor on the hundredth anniversary of the first Kaiser's birth, stands on the site of the old Schloss of Liberty, and faces the Royal Castle. It rises from a base of polished red Swedish granite, at the four corners of which are bronze lions in the act of springing. The colossal equestrian statue of the Emperor is also of bronze. Holding the bridle, and with a palm leaf in her hand, is the figure of Peace, the whole design being exceedingly dignified and imposing. With the portico behind it, it cost 4,000,000 marks.

HERE MAETHAUSIUS, Technical Attache to the German Embassy in London, in an article on "William Morris and the Fifth Exhibition of Industrial Art," says: "The exhibition shows the Art industry in England at a stage which can only be regarded as the result of decades of earnest endeavour. Great progress has also been made during the last twenty years in other countries, and the need has made itself universally felt of arresting the grievous decline of German handicraft which set in with the classical revolution at the end of last century, and which, by the middle of the present century, had become intolerable. A return to old traditions has been eagerly sought everywhere. What, however, distinguishes England from other countries is the new and independent spirit she displays. Absolutely novel forms have been found, and the resulting ornamentation shows real creative power. England has entered on new and successful paths, while we others have hitherto contented ourselves with copying our old masters."

AFROSOS of the recent opening of the celebrated Borgia Apartments in the Vatican, with the beautiful frescoes by Pinturicchio, an account of which appears in another column, it may be interesting to mention that there is a model of a portion of one of the "stanze" in the South Kensington Museum. In 1885 the Museum authorities obtained permission to have a model made of a portion of one of the rooms, and in 1888 it was completed and forwarded to South Kensington. The delicate relief decoration of the groins and bands was executed in the model by Signor Adolfo Consolani, and the copies of the frescoes were painted by Count Lemmo Rossi Scotti of Perugia. The frescoes represented in the model are St. Catherine before the Emperor Maximin, the Escape of St. Barbara, and the Visit of St. Paul the Hermit to St. Anthony. The subjects of the paintings on the ceiling are scenes in the story of Osiris. It is believed that the construction of this model aroused

great interest in this suite of rooms at Rome, with the fortunate result that his Holiness Pope Leo XIII. ordered the books belonging to the Vatican library, until recently kept on shelves placed against the walls of the "Appartamento" to be removed, and arrangements made so that the public might have access, a privilege until now exceedingly difficult to obtain.

THE village of St. Pierre Livron, in the Lot, has been destroyed by a landslip. It was a picturesque place dear to painters. The Church was of a great age. It stood on a cliff rising sheer from the River Bonette, with the village clustering round it. There was a hollow on the other side of the village where rain used to lodge. What with the infiltration of water from above, and the wearing action of the river below the cliff, the whole site of the village with its cemetery and some back land got detached. The landslip, however, has been gradual and it still goes on. The latest news is that the Church has disappeared. The Bonette, checked in its force by the fall of the village, is flooding the upper part of the valley it flows through.

A DISPUTE has been pending in the High Court of Justice for some time between Messrs. Murdoch and Cameron, Limited, of London and Glasgow, engineers and contractors for public works, and the Corporation of Southend-on-Sea, over the erection of a promenade pier there, the contract price of which is about £20,000, and in consequence work has been suspended during the last five or six weeks. Sir William Arrol, M.P., with Mr. John Waugh, C.E., and Mr. William Jaffrey, having visited and inspected the pier and reported favourably as to the state of the work and the probability of the pier being ready for the ensuing season's traffic, terms have been arranged between the corporation and the contractors, who are to receive £2000 bonus in addition to their original contract price. The action has been taken out of Court, and work on the pier has been resumed under the direction of Mr. John Wolfe Barry, the newly appointed engineer for the Corporation.

An interesting report has just been published by Professor L. de Launay, upon the ruins of the Great Zimbabwe in South Africa. These ruins were first discovered by the German explorer Carl Mauch, and since the publication of the results of his exploration they have attracted much attention from archaeologists and scientists, who believe that they afford a proof of an ancient Phœnician occupation in these remote lands. The principal structure among these ruins is the Great Zimbabwe, which rests upon a granitic plain 3000ft. in altitude, near the eastern banks of the Sabia, and about twenty-five miles from Fort Victoria. This structure consists of two distinct edifices. To the north there is a sort of fortress, or acropolis, and to the south a wide elliptical enclosure, surrounded by two conical towers. The acropolis is upon a rock, at the summit of which stand blocks of stone from forty to fifty feet, and pillars of clay about 10ft. in height, all of which are covered with curious geometrical designs and conventional figures of birds. Excavations by M. de Launay brought to light the shapeless remains of pottery and vessels, one of the latter bears a design representing a Hottentot landing three zebras and a hippopotamus. More important was the discovery of small clay crucibles that have been used many centuries ago, for the smelting of gold. All of these contained particles of the precious metal, as well as some very ancient tools.

It is high time the statues and monuments that occupy places of honour in the streets of the City were cleansed, if they are to be in readiness for the Jubilee. A spasmodic cleansing, to be followed by a repetition of the neglect that has for so long been the order of the day, will, however, be of but little advantage. What is needed is a periodical spring cleaning that will rescue them from the uncared-for condition in which so many of them now are.

#### THE COUNTY COUNCIL AND ITS WORKS DEPARTMENT.

THE special committee appointed by the London County Council in November last to inquire into "the management and financial position of the Works Department since its inception and as to its future prospects" presented its report to the Council at its meeting yesterday. In the report the committee first gives an extract from the statement of Mr. Waterhouse, one of the assessors, who gave close attention to the best means of avoiding in the future any recurrence of the falsification of accounts which led to the inquiry. Mr. Waterhouse says:—"The total amount of the fabricated entries, as stated by the comptroller in his report, amounted to £7229 11s. 10d. None of the cash outlay of the department, except the petty cash and the wages, the payment of which is entrusted to guaranteed pay clerks, is in the hands of officers of the Works Department, and these entries had no reference to any misappropriation of money, nor did they conceal any action whereby any employé of the department was pecuniarily advantaged. They resulted simply in a false statement as to the cost of various works, the apparent cost of some being decreased by amounts which were included in the costs of others. It is for me to point out any defects in the office arrangements which rendered the fabrication of these vouchers and entries possible, and prevented their immediate detection. It may be well, however, here to refer to the evidence of Mr. Fullwood. The allegations with regard to false entries in the books contained in his letter to Mr. White of November 21st, 1896, were, in cross-examination, found to relate to some entries—of which he instanced two for amounts of £1 2s. 9d. and £1 3s. 1d. occurring in the month of June, 1893—in the books of his own department of gas-fitting, in respect of foremen's time, which he said was evidently false, inasmuch as no foremen were employed. I find that these entries were posted from the time-sheets in the same way as all other wages, and that the amount represented a proportion of the wages of the foreman engaged in generally superintending the work at some lodging houses of which some gasfittings under Mr. Fullwood formed some part. There does not appear to have been in this case any attempt or intention to misrepresent facts." On this subject the committee had nothing to add to the remarks in Mr. Waterhouse's report. It concurred with the recommendation of both the assessors—that, with a view to

#### PREVENTING SIMILAR PRACTICES

in the future, the book-keeper should be placed in a position of independence with regard to the manager. After a reference to the inception of the Department, which was connected with what might be called the labour policy of the Council, the committee said that it had carefully reviewed the operations of the Works Committee in comparison with the practice of provincial municipalities and railway companies, and while it seemed probable that the execution of works without the intervention of a contractor prevailed in regard to municipal bodies and railway companies to a degree much larger than is generally supposed, the tendency to dispense with or even to abolish the contracting system altogether has been much stronger in the London County Council than in any case that has come under its notice. The department was formed in circumstances of great exigency and disadvantage, and, while there had been considerable conflict as to the cost of this and that particular work, it thinks it safer to form an opinion upon the general operations, and upon the statements of all parties, both opponents and admirers of the department, than to enter upon any minute examination of the outcome of each particular operation. The experience of the Council, the practice of other municipal bodies, of railway companies, and of large manufacturers and estate proprietors, had led to a firm conviction that some definite organisation for the direct employment of labour and the direct execution of public works by

the Council, under the superintendence of its own officers, was desirable and beneficial. After stating that inquiries made of the larger corporations tended to show that work of a structural character was carried out, as a rule, by contractors, the committee said that in the business of the Council, except for machinery or wrought-iron or steel work, the intervention of a contractor had been practically discarded in the engineering department, and the evidence received was not unfavourable to a continuance of that system. The cases in which the department had executed works most largely within the respective estimates had been of that character. There was much more contention as to the dealing of the Department with

#### ARCHITECTURAL CONSTRUCTION,

but there was no substantial remarkable difference of opinion as to the general quality and character of the work. Upon this subject the committee said: "There has been excess of cost, but we are unable to say that in the aggregate this would not have been far greater had the Council been left to deal only with those contractors who would accept their terms and conditions of contract. Latterly, with a more settled plan of operation, the Works Department has been more successful, and in regard to recent works, even of Architectural character, the good quality has been maintained, and the cost does not appear to have been in excess of that which would have been paid to a contractor. A period of at least two years was necessary for the economic arrangement of such a new department. In Architectural work there is not the same risk to be insured against as in the underground operations of engineering work; there is not the same uncertainty with regard to estimates, nor the same margin of possible profit. It is unlikely that Architectural buildings will, owing to the numerous details and intricacies, be executed by a Works Department at less than the prime cost to a contractor; but, on the whole, it appears that the Works Department can execute Architectural works of equal quality, without loss, and with no greater charge than the Council would pay to contractors. This inquiry has not, however, led us to believe that the full average of builders' profit upon Architectural work can be obtained by the direct employment of labour, though there can be no doubt that the power of the employer to do the work himself is a valuable check upon builders who might otherwise think the employer was wholly in their hands." The committee concurred in the general opinion of witnesses that there should be

#### NO UNIVERSAL EXCLUSION OF THE CONTRACTOR.

With reference to the form of contract which states that contractors shall pay the wages "in practice obtained by the various trade unions in London," it considered that the objection of contractors to those words can be removed by inserting a mention of the unions of employers where such exist, and the extent to which such exist, together with the trade unions which are exclusively organisations of workmen. The committee did not see its way to recommending any alteration of the standing orders, such as would be required to admit of competition in tendering between the department and contractors. Nor did it recommend the making of a selected list of contractors or the abandonment of the customary mode of open tendering. It regarded the employment of contractors as beneficial, if considered only as strengthening the resources of the Council for the undertaking of public works and keeping the officials concerned in the preparation of estimates and supervision of works closely in touch with the prices of work and of materials. Generally, as to the

#### FUTURE OF THE DEPARTMENT,

the Committee stated:—"No witness that has appeared before us has advocated the abolition of the Works Department. On the contrary, even those who have criticised the work of that Department most keenly have, at the same time, advised its retention. One witness stated that he did not propose to abolish

the Works Department, that he thought the Department was a very useful provision for the Council to have at its disposal; that he thought there were a large number of works that could be done quite as well by the Council as by a contractor, but that he was not certain that building works could be included in that list. Another witness said that he would not contemplate abolishing the Works Department as a Department, and that in his opinion it was better that it should be a separate department. With reference, however, to the Works Committee there has appeared a general concurrence of opinion as to its unsatisfactory constitution. Under the standing order of the Council this committee consists of from sixteen to twenty members with three *ex-officio* members. The subject appears in the evidence in many different forms, and in view of its importance we have given it the fullest possible consideration. Our conclusion is that it is for many reasons expedient that fresh arrangements should be made. After a brief reference to some of the proposed alterations, the committee concluded by stating that it had received a memorandum from four members of the committee which, under the special circumstances attending the appointment of the committee, it thought should be presented as an appendix. The following are the committee's recommendations:—

"(a) That in the opinion of the Council some definite organisation for the direct employment of labour and the direct execution of public works by the Council under the superintendence of its own officers is desirable and beneficial.

"(b) That a Works Board be substituted for the Works Committee, such board to be elected forthwith, one member to be nominated by and from each of the following committees: Finance, Asylums, Bridges, Fire Brigade, Highways, Improvements, Main Drainage, Parks, and Housing of the Working Classes; and that in future years the election of members of the board do take place at the meeting of these committees next to March 31.

"(c) That any committee desiring to propose to the Council the carrying out of any works without the intervention of a contractor shall, in the first instance, obtain an estimate from the proper officer and then refer such estimate to the Works Board for their consideration before reporting to the Council.

"(d) That the works manager shall, unless in any case otherwise ordered, carry into execution all works which the Council resolves to execute without the intervention of a contractor.

"(e) That when the Council wishes to execute any works without the intervention of a contractor the plans, specification, and estimate shall, unless otherwise ordered by the Council, be thereupon referred to the works manager.

"(f) That the works manager shall be responsible to the Works Board, and the Board shall report from time to time to the Council.

"(g) That this report be referred to the General Purposes Committee, and that it be an instruction to that committee to amend the Standing Orders in accordance with the foregoing recommendations.

"(h) That it be referred to the General Purposes Committee to make further amendment of the standing orders by the insertion of words coupling the unions of employers where such exist with the trade unions, in reference to the rates of wages and hours of labour.

"(i) That it be referred to the General Purposes Committee to make further amendment of the standing orders by omitting provisions giving powers to the clerk of the Council to direct examination of the books of anyone contracting with the Council for the execution of works, other than the time sheets or books, or wages sheets or books.

"(j) That the statement of Mr. Waterhouse be referred to the comptroller for report upon each and all of his suggestions with reference to the accounts, and that the comptroller's report be referred to the General Purposes Committee with a view to the adoption of Mr. Waterhouse's recommendations."

## Professional Items.

**BIRMINGHAM.**—A deputation from the Architectural Association has waited on the Lord Mayor, their object being to impress upon the municipal authorities the importance of the City Council taking power to itself under the Birmingham Churches Bill to prevent the replacement of Christ Church, should that building be removed, by any building unworthy of so important a site.

**BLAYDON.**—An important engineering work is being carried out just now in connection with the North-Eastern Railway at Blaydon. It involves the straightening of the line, which, for a considerable distance on either side of Blaydon Station, pursues an erratic course. The North-Eastern Railway Company some time ago resolved to have this work done, and plans were prepared by their engineer, Mr. Chas. Harrison, for the straightening of the line from a point a little to the east of Blaydon Burn to a point a little to the west of Stella Staith. The new line between these points is not exactly straight, but the curve is so gentle as to be almost unappreciable. The whole of the work is being carried out to the plans of Mr. Charles A. Harrison, whose resident engineer is Mr. C. M. Bengough, A.M.I.C.E., by Mr. H. M. Nowell, the well-known railway contractor, of Leeds, whose engineer on the work is Mr. T. E. Scalfie, A.M.I.C.E. The cost of the making of the quay wall, and of the extension, is £21,000.

**BRIGHTON.**—The Education Department has approved the plans of the School Board for the erection of a School for Afflicted Children, and for a new cooking school in Trafalgar Court and in the rear of York Place. It is proposed to add a south wing to the Higher Grade School in Pelham Street, the estimated cost of the building being £4000. The Education Department is to be asked to sanction the adaptation of the existing workshop at York Place and the covered space on the land to the south, recently agreed to be purchased by the Board, to the purposes of a centre for manual instruction in wood and iron, and the formation of a class-room for drawing and modelling. It is further proposed that a second centre for instruction in woodwork be formed in the covered play shed of the Ditchling Road school. The estimated cost of the alteration of the manual instruction centres is £450. At Queen's Park school it is proposed to enlarge the boys' and girls' departments and the infants' department, and to erect a school hall, the whole being estimated to cost £1600. There is also a proposition that a plot of land at the corner of Middle Street and Boyce's Street, together with the premises Nos. 29, 30, and 31, Middle Street, be purchased for the sum of £2400. If approved, it is proposed to utilise the land for the enlargement of the Middle Street Infants' School.

**CLECKHEATON.**—The opening of new Sunday schools which have just been built in connection with and contiguous to the United Methodist Free Church Central Chapel, at a cost of about £8000, including £1400 for the site, recently took place. The new buildings, erected from designs by Mr. R. Castle, of Cleckheaton, form, with the more massive structure of the chapel, a most imposing Architectural whole; and the schools themselves have probably few parallels in the provinces in extent, arrangement and equipment. The assembly-room is capable of seating 1000 persons, and the lecture hall about 150 persons; and, besides the library, bank-room, and sewing-room, there are five large and twelve smaller class-rooms. Beneath the assembly hall there is a tea-room, calculated to accommodate 400 persons. The premises are lighted by electricity.

**CORK.**—In connection with the manufacturing of bricks at Cork, two very important contracts have just been secured by two prominent Leeds firms. Quite recently the Cork Brick Manufacturing Company was formed for the purpose of erecting works near

Cork city, for the making of bricks, and Messrs. Thos. C. Fawcett and Company, Limited, a well-known engineering firm in Leeds, were declared the contractors for the supplying and erection of the necessary machinery and plant in the brick factory now in course of erection. Messrs. Fawcett have just begun the contract, and are pushing ahead rapidly with the work intrusted to them. The directors of this new company having invited tenders for a powerful road locomotive engine and six large waggons for the conveyance of bricks, the contract was secured by Messrs. J. Fowler and Company, of Leeds, who have undertaken to have this engine and the waggons delivered to the owners at Cork before the end of April.

**EDINBURGH.**—The deputation of the Edinburgh Town Council which visited London for the purpose of inquiring as to the experience and practice of the vestries in regard to the use of Australian hard wood for street-paving purposes, has completed its report. Summing up the results of their investigations and inquiries, the deputation states that it is satisfied that the Australian hard woods possess valuable and peculiar qualities, rendering them, so far as present experience goes, highly suitable for street-paving purposes. No specimens examined by the deputation presented any appearance whatever of ordinary decay or rot. No doubt street-paving with hard wood is of the nature of a luxury, and will cost more than whin or granite paving, but the time has come when Edinburgh must face the question of following London experience and enterprise in this direction, especially with her principal streets. The deputation considers that the hard woods recommended will not be excessive in cost, nor far behind in durability (having in view the fact of Edinburgh traffic being so much lighter than that of London), and the gain in comparative noiselessness, in smoothness, and therefore ease in traction, as well as in cleansing facilities, will sufficiently compensate for the extra cost. On the respective merits of the various woods referred to in this report, the deputation is disposed to recommend that black butt and tallow wood be fairly tested, as it is possible that as good, if not better, results may be thus obtained than from the other timbers which have been longer in the market.

**GLASGOW.**—On Saturday last Mr. D. Bennet Dobson's building-construction students visited the new Ruchell Hospital, at present in course of erection for the sanitary authorities of the city. The cost of the whole work is expected to be over £200,000. Mr. A. B. McDonald, city engineer, is the Architect of the work, and both in point of design and general planning it is to be commended as being thoroughly efficient. The administrative block, which faces the west, will accommodate about 200 nurses on either side, and the central portion will be reserved for doctors' and matrons' rooms. The large pavilions are each 66ft. by 22ft. and contain fifteen beds, i.e., ten in the acute ward, the air space being 23,100 cubic feet; and in the convalescent five beds, with an air space of 11,550 cubic feet, and a distance of 8ft. between each bed. Fresh air is admitted at the wall under each bed as well as at the window bossings. The heating everywhere is by low pressure hot water. In each ward, however, there are two fireplaces. In these pavilions the nurses' rooms are between the acute and convalescent wards. The clearing houses are also especially worthy of notice. The cost per patient, exclusive of site, is about £486. A central water tower likewise forms a prominent feature, 150ft. high, containing four tanks, each 12,800 gallons. Mr. Hannah conducted the party in the absence of Mr. McDonald.

**ILKLEY.**—The result of the recent arbitration proceedings, in which trustees of the Skipton Grammar School Estate claimed damages against the Ilkley District Council for acquiring water rights, and for works in the additional supply of water to Ilkley from the lands of the claimants situate at Addingham Moor Side, in the Valley of the Wharfe, has just been made known. The total valua-

tion as given in evidence was £1347 8s. 2d., being an average of £36 18s. The umpire has awarded £650 12s. 6d. on the aggregate claim. The proceedings in the claim made by the trustees of the late Mr. John T. Wall, in which the valuation by the claimant's witnesses amounted to £354 4s., and by the witnesses for the District Council to £4 8s. 6d., have resulted in £189 12s. 6d. being awarded.

LEEDS.—The Meadow Lane Works Sub-committee of the Leeds Corporation has considered tenders which had been received for work in connection with the new purifying plant. The Gas Committee has given power to the sub-committee to accept tenders, but these will come before the City Council for confirmation. The tender of Mr. George Cross, Bowman Lane, for buildings, was accepted at £4760. For two horizontal engines required for the new retorts, Messrs. J. and R. Rankin, Liverpool, were successful, their tender amounting to £567 10s. The tender of Messrs. Clayton and Sons, Hunslet, for pumping valves, steam connections, girders, and columns, roofs and principals, was accepted, the amount being a little over £7000.

LIVERPOOL.—At a special meeting of the Health Committee of the City Council, held to consider the project for widening Cook Street by making a piazza, 10ft. wide, under the front portion of the new buildings erected on the south side of the street, Mr. Watson Rutherford, the solicitor for the owners of the buildings, had a long interview with the committee, in the course of which the possibility of the scheme was discussed. Mr. Rutherford was asked if the trustees of the estate were prepared to cut off the projecting corner next to the entrance of the Law Association Buildings. Mr. Rutherford stated that that would cost a further £5000. After discussing the matter, the committee decided to recommend the Council to carry out the improvement at a cost, including the cutting off of the corner, of £27,500.

PADDINGTON.—St. David's Church, which has the distinction of being the first Church built expressly for the Welsh in the metropolis, was opened at Paddington on the 31st ult. The new building, which is capable of seating about 400 people, has been designed by Mr. C. Evans Vaughan in the Gothic style. Under the Church proper is a spacious hall, which is used as a Sunday school, and during the week for meetings and concerts. At the back of this hall are the caretaker's rooms. The cost of erection has been very considerable, and now that the building is ready for use the Church council finds that it has to face a deficit of £800.

SHEFFIELD.—The alterations which were commenced some time ago at the Surrey Street Music Hall have now been completed. The principal alteration is that affecting the exits. A new staircase has been erected, and has an outlet in Surrey Street. The new staircase is lighted by electricity, and the number of exits is now three in place of the former two. The cost of the change has been something like £600, and this includes the thorough overhauling of the drainage arrangements.

THORNTON, N.B.—Estimates have been accepted for the erection of a Free Church Hall at Station Road, Thornton, to accommodate about 250 persons. Mr. William Williamson, jun., Kirkcaldy, is the Architect.

WEST KIRBY.—The corner-stone of the new Roman Catholic Church of St. Agnes, at Darmond's Green, West Kirby, was laid last week. The new Church is planned for nave, transepts, and chancel, with a presbytery adjacent, but at present the nave, with a seating capacity of 250, will alone be built. Mr. Edmund Kirby is the Architect. The building will be of Ruabon brick, with terracotta and red stone, the cost of the full scheme being about £3000. The floor will be of wood blocks, and the inner roof of pitchpine. Mr. R. Allen, Cloughton Road, Birkenhead, is the contractor.

YORK.—A company assembled at Harker's Hotel, York, a few days ago, to see a working model of a covered stall, designed by Mr. Liversidge. Mr. Liversidge said schemes for covered markets had been suggested, one of which it was estimated would cost £50,000, but none of them seemed to find favour. He had endeavoured to find a solution of the difficulty in the form of the design which he had the privilege of submitting to their notice. The highest estimate of the cost was not more than £5000. Mr. Liversidge then proceeded to explain that he proposed that rows of pits, or troughs, should be dug in Parliament Street. Each of these excavations would be not more than 2ft. wide, 6ft. deep, and 21ft. long, and would be fitted with covers which could be easily thrown back, being made in parts for that purpose. The next step would be to raise the pillars, which worked into large joints at each end of the trough. This simply meant that the pillar would be raised from the horizontal position to the perpendicular. The remainder of the structure was all in one piece, and was raised automatically, sliding up grooves in the pillars till the top was reached. The whole of the stalls could be joined end to end, and the frameworks automatically raised together. The covering for the roof was a light waterproof material similar to that which covered the Westminster Aquarium.

## Correspondence.

### WHO PAYS FOR THE TROWEL?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I ask you if you will kindly answer in your valuable paper for me this question?

Who should provide and pay for the silver trowel to be presented to the gentleman laying the foundation stone of a Church, the builder's contract for which is £5700, and the probable amount the Architects will receive commission on being over £6000? Should the builders, or the Architects, or the Church Committee provide and pay for it? Who should hand or present the trowel to the gentleman laying the stone? If either the builders or the Architects provide it, have the Committee any choice in the selection, design, or inscription? If there is no fixed rule, may I ask you if you will kindly say what is the general practice? Also—under the circumstances of its being a nominal £6500 undertaking—about how much should be spent upon the trowel?

I am, Dear Sir,

Yours faithfully,  
S. G. R.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS and SIXPENCE per annum by half-yearly or annual prepayments.

## SOCIETY MEETINGS.

**The Architectural Association.**—At the meeting of the Architectural Association on Friday night—Mr. W. H. Seth-Smith in the chair—it was announced that the "House List" had been constituted as follows:—President, Mr. Hampden W. Pratt; vice-presidents, Mr. Banister F. Fletcher and Mr. Alfred H. Hart; committee (ten to be elected), Messrs. R. S. Balfour, W. D. Caroe, H. B. Creswell, A. S. Flower, F. W. Goldsmith, C. de Gruchy, F. G. F. Hooper, E. H. Parkes, H. Passmore, Beresford Pite, G. H. F. Prynn, W. H. Seth-Smith, J. W. Stonhold, A. B. Thomas, and J. Williams; hon. treasurer, Mr. Hampden W. Pratt; hon. librarian, Mr. C. H. Freeman; hon. secs., Mr. E. Howley Sim and G. B. Carvill; hon. solicitor, Mr. W. H. Jamieson; hon. assistant librarian, Mr. E. W. M. Wonnacott; hon. auditors, Mr. M. Garbutt and Mr. H. P. G. Moule; assistant secretary, Mr. D. G. Driver. The next meeting of the Association will be held on April 30th, when Mr. Hugh Stannus will read a paper on "The Classic Cornice."

**Glasgow Institute of Architects.**—At the usual quarterly meeting of this institute, held in the rooms, Pitt Street, Mr. John Jas. Burnet, A.R.S.A., president, reported that the council had remitted the question as to the lighting of the lower Church of Glasgow Cathedral to a committee of council. He also reported that the Corporation of Sheffield had appointed a jury of three members of the Sheffield Society of Architects as assessors to adjudicate upon competitive plans, and that it had been remitted to a committee of council to consider the position of this institute with regard to Architectural competitions. The president also intimated that the council had appointed himself and the vice-president as delegates to attend a meeting of the Sanitary Congress to be held at Leeds in September. Letters from Messrs. Honeyman and Leiper, acknowledging in gratifying terms the congratulations of the institute on their election as Academicians, were read. Letters from Mr. Gourlay regarding the examination of drawings for the Technical College Prize were read, and it was reported that the prize, which was to be called the Institute of Architects Prize, for the best set of drawings and sketches, had been awarded to Mr. William S. Mayer. The secretary reported that it had been remitted to a committee of council to consider as to a curriculum of Architectural education.

**The Edinburgh Architectural Association.**—The Edinburgh Architectural Association has visited Hatton House, Mid-Lothian. The house, it was explained, has a massive central keep, with later additions round it. In the time of Robert II. John de Haltoun was proprietor, and in a few years it passed to the Lauder family, the Lauders of the Bass, in whose hands it remained for several centuries. The Lauder family were implicated in the assassination of the Earl of Douglas, and incurred the deep resentment of that powerful family, who captured the keep, but were ousted by the timely assistance of the King, who sent the "great bombard," supposed to be Mons Meg, to the help of the Lauders who, again obtaining possession, were permitted to re-edify the keep. Early in the seventeenth century Charles Maitland, brother of the Earl of Lauderdale, and a well-known officer of State in Scotland, became proprietor, and began the extensive additions of which much remains. He appeared, to a certain extent, to have copied his brother's manner of laying out the gardens at Ham, and the work which was carried on by his successor had made the house with its gardens, terraces, sundials, and statuary, one of the most interesting and pleasant in its own part of the country.

**The Royal Scottish Society of Arts.**—A special meeting of this Society was recently held in the hall, 117, George Street, Edinburgh, Professor Armstrong, president, in the chair. The secretary (Mr. W. Allan Carter) read a report by the committee appointed to judge the electric meters submitted in competition for the special Keith prize of £50. It reports that nine meters were sent in. These

were tested at the Central Station, Torphichen Street, Edinburgh, with the continuous and alternate currents. The merits and demerits of the various meters were mentioned, and the committee came to the opinion that while several of the meters possessed many points of novelty and ingenuity which might be capable of further development, none of them were of sufficient merit to warrant the Society in making any award.

**Bristol Association of Clerks of Works, and Builders' Foremen.**—By permission of the Dean, the members of this association paid a visit to Bristol Cathedral on Saturday afternoon. Mr. Hayward conducted the party, and in a very interesting and instructive manner explained some of the most notable facts relating to the founder and benefactors of the monastery, also of the different periods and diversity of style of Architecture in the various parts of the Cathedral. This is the first of a series of visits arranged to be paid during the coming summer to the various places of historical and Architectural interest in the neighbourhood.

**Institution of Civil Engineers.**—The President, Mr. J. Wolfe Barry, presided at the annual dinner of the members of the Institution of Civil Engineers, held in the hall of the Merchant Taylors' Company, Threadneedle Street, on the 31st ult., and proposed "The Navy, Army, and Auxiliary Forces." Sir Frederick Bedford responded on behalf of the Navy, and Mr. St. John Broderick, M.P., for the Army and Auxiliary Forces. "The Institution" was proposed by Sir Lintorn Simmons, to which the President replied.

MR. WILLIAM HUNT, Chief Engineer of the Lancashire and Yorkshire Railway Company, died on the 29th ult., at Crumpsall, Manchester. Under his direction the company has expended over £8,000,000 in widening the railway and in constructing new lines and stations. Mr. Hunt was a native of Banbury, and was 54 years of age. Before entering the service of the Lancashire and Yorkshire Railway Company, he had considerable engineering experience at the East and West India Docks, London, and in the North London and the East London Railway.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**BISHOP AUCLAND.**—For laying 2130 yards pipe sewers, and other works in connection therewith, Winton Park, for the Rural District Council. Mr. C. ## HOSPITALS.\*

By FREDERICK BATCHELOR, M.R.I.A.I.

IT would be impossible to bring within the scope of a single lecture the variety of subjects which would naturally be included in so comprehensive a title as Hospitals and Hospital Construction; as, for example, the history of hospitals, the classification of modern hospitals, methods of administration, principles of construction, and the several systems of lighting, warming, and ventilation, &c. Upon each of these branches of our subject volumes could and have been written. Perhaps, as the members of the senior class of design are now about to engage upon designs for a cottage hospital, I may here mention the following as being most valuable books on the subject: Burdett's "Hospitals and Asylums of the World," Saxon Snell and Mouatt's "Hospital Construction and Management," and Burdett's "Cottage Hospitals." Burdett's work is of especial value on account of the very excellent portfolio of plans, both of hospitals and lunatic asylums, which accompanies the volumes on Administration, Construction, History, and Bibliography. I wish to state here that I am indebted to Mr. Henry Burdett for much of the information

others the sick were cared for, and the wounded healed. The latter bore the name of "Broin Bearg," the house of sorrow. This example of the princess was widely followed throughout Ireland, and the ancient laws of this country sanctioned the providing for the sick "a physician, food, proper bed, furniture, and a proper house." It is a fact that

IRELAND HAS ALWAYS LED THE WAY in the founding of charitable institutions. To take a long stride from ancient to very modern history, it is interesting to note in passing that Dublin stands second in the United Kingdom in the proportion of hospital beds to the population which it provides, being 6.39 per 1000. This proportion is only exceeded by London, which provides 7.59, of which 1.91 are voluntary only. Edinburgh, which stands third, has 3.80; Glasgow, 3.44; Manchester, 2.83; and Liverpool 2.24. Of Continental cities, Rome occupies first place with 18.28, all the Italian cities being proportionately high. Hospitals were not founded in England until very long after their establishment in the sister isle. It is possible the Romans may have introduced a similar system of gratuitous medical relief as that to which they were accustomed in their own country, but we have no authenticated record of any such system. The earliest hospital of which we

many others of our now large and flourishing institutions had, like St. Bartholomew's, their beginning—probably due to the same access of religious fervour which found vent in the Crusades, and gave the impulse to the found-

PAV. HOSPITALS.  
SUB-CLASS II.  
ROYAL INFIRMARY,  
PRESTON.

ing of charitable and religious institutions on the Continent. They were then called "hospitia" (hence our modern word hospitals), and were established generally for the reception and relief of lepers whose malady was one of the scourges of Europe. These leper hospitals were very commonly in England and Scotland known as Spitals, hence the frequency of such names of places as Spital, Spitalfields.

### MODERN HOSPITALS.

The leper hospitals and other kinds of the old hospitia disappeared with the improvement of our social conditions, and substitutes for them on a broader scale began to be established in the modern form of hospitals. Of public establishments under this general designation there are now, as is commonly known, three distinct classes: (1) Hospitals for the reception and treatment of the sick and hurt, hospitals for the board and education of children, and hospitals for the reception and permanent board of poor old persons of both sexes. It is, however, with the first-mentioned class alone we have to deal, and in this class are comprehended, besides the general hospitals, lying-in hospitals, consumption hospitals, ophthalmic and orthopedic hospitals, children's hospitals, and for the latest innovation dental hospitals, each with its peculiar accommodation and staff of officials. Independently of these are hospitals for the treatment of mental maladies, popularly known as lunatic asylums, also asylums for the reception and treatment of naturally imbecile children. To these must be added the isolation hospitals for the treatment of cholera, smallpox, scarlet-fever, and other infectious diseases, which have been established in recent years by every energetic sanitary authority, out of the rates. Besides these institutions under civil administration are those hospitals which are maintained by the States of civilised countries for the military and naval services. In the United States, where every medical college has its

PAVILION HOSPITALS.  
SUB-CLASS I.—ADDENBROOKE'S  
HOSPITAL, CAMBRIDGE.

which I hope to lay before you this evening. As regards the history of hospitals, the real beginnings of a now universal system have to be sought for in books dealing mainly with other subjects, wherein an occasional allusion points to some more or less embryonic hospital of the past. Speaking of Britain (or greater Britain to be more correct) I may mention that long before the Cross became a sacred symbol, hospitals were in existence in Ireland. In 300 B.C. the Palace of Emania was founded in Ireland by the Princess Macha, "of the golden hair," and continued to be the chief royal residence in Ulster till it was destroyed in 332 A.D. To this were attached two houses, in one of which the Red-branch Knights hung up their arms and trophies, while in the

have reliable information is St. Bartholomew's. It was founded between 1123 and 1133 by Rahere, the jester of King Henry I., who, like the Chicot of history and the Jacques of poetry, grew tired of fooling, and joined a religious order, and obtained from his old master, the King, a grant of an empty space of ground in the suburbs of London called Smithfield. There he built a Priory, and on the south side of this he erected a hospital. The original "Bart's," though on a smaller scale than the present, was meant to fulfil a wider scope. It was meant not only for "poor diseased persons until they got well," but for the reception of obstetric cases, and it also provided for the maintenance of all children born in the hospital until they reached the age of seven, if their mothers had died there. It was about this time, that is to say, about the twelfth and thirteenth centuries, that

\* A lecture delivered to the members of the Architectural Association of Ireland.—ED.]

own hospital, or the right to teach in the wards of public institutions, there are also many hospitals or asylums for inebriates, for opium users, and those addicted to other narcotics.

#### IMPROVEMENTS.

Until the middle of the nineteenth century, the organisation and management of

class. The administration is central between two well-proportioned wards of two stories, the upper wards containing nineteen beds, and the ground floor, with ward, fifteen beds. The sanitary blocks at the ends of the wards are not properly disconnected from the wards. The out-patients' department occupies the ground floor of the south ward. A wing projecting eastward from the southern pavilion was added

formerly used as infectious wards, but they are now occupied as a children's hospital.

Amongst other hospitals of the class, I may mention the Ayr County Hospital, the Bolton and Macclesfield Infirmarys, and the London Temperance Hospital in Hampstead Road.

**SUB-CLASS III.—The municipal pavilion**  
(A number of pavilions arranged on one or both sides of a corridor.)

The Derbyshire Royal Infirmary has a most instructive history. The original infirmary was built in 1806, and was constructed on what was at that time considered to be the most perfect system of ventilation and sanitation. The building consisted of a large rectangular block three stories in height, and was warmed and ventilated by means of a "Cockle" stove in the basement; the fresh air supply to this stove was brought from the summit of a tower in the grounds about 70 yards distant, by means of a brick channel 4ft. square, and was distributed all over the hospital by means of subsidiary ducts built into the walls. In the course of time it was found that the ventilating shafts were in direct communication with the drains, and that rats had free access to the building, which had in fact "become saturated with septic poison, so that it was impossible to undertake with safety the simplest operations." It was, therefore, decided to erect an entirely new hospital, the foundation stone of which was laid by Her Majesty the Queen on May 22, 1891. This new hospital, as will be seen, consists of four wards of twenty-four beds arranged on both sides of a central corridor. With the front and rear administration blocks and the laundry and boiler houses in three separate blocks on the central axis, one end of the corridor terminates with two small ophthalmic wards of six beds each, and with the ophthalmic operation room in connection; the other end of the corridor is occupied by the out-patients' department. The general operation room is also off the main corridor. There is also a detached nurses' home. Some of the buildings I have

PAVILION HOSPITAL SUB-CLASS III.—DERBYSHIRE ROYAL INFIRMARY.

hospitals, and the nursing of the sick in Great Britain, and in most parts of Europe, were, except in some few instances, extremely defective. Public opinion was then aroused on the question, and certain principles laid down on hospital construction and hospital nursing which have been recognised and adopted to a greater or less extent since that time. These principles may be briefly summed up under three heads: Construction, Administration, Nursing. Under the first head, "Construction," will naturally be included the general planning and classification of hospitals according to the arrangement of their wards. The determination of the special form of plan to be given to a hospital depends on several considerations. The area, conformation, and shape of the site must necessarily influence in a very marked degree the disposition and form of the buildings to be placed upon it. Climate, again, is an important factor in the consideration of hospital planning, the requirements in England and those in India, for example, being of a very different nature. In all hospitals, however, whether they are in the tropics or in Europe, on an ample site in the country or on some much restricted site in a town, the ward is the most important feature, and the one in relation to which all the other parts must be grouped. And in adopting a system of classification for the more intelligible ordering of the subject, such as Burdett suggests, it will be found that the most marked and essential difference between one group of hospitals and another lies in the position of the wards in relation to one another and to the other parts of the building.

#### CLASS I.—PAVILION HOSPITALS.

In this class are included all hospitals which have their wards constructed on what is known as the "Pavilion" system—that is, in which the ward is a parallelogram entirely detached, on at least three sides, with windows on both of its longer sides facing each other, and attached to the main block at one end only. This class is again divided into six sub-classes, as follows:

**SUB-CLASS I.—The single pavilion or straight plan.** (Two pavilions placed end to end with the administration interposed.)

Addenbrooke's Hospital, Cambridge (see illustration), as originally designed by Sir Digby Wyatt in 1864, was a typical hospital of this

subsequently; it is occupied on the ground floor by an extension of the out-patient department and special wards, and on the first floor by small wards, those at the extreme end being for isolation purposes, and with separate staircase. There is a detached nurses' home, giving accommodation for twenty-four nurses. Other hospitals of this class are: The South Infirmary, Cork; Donegal County Infirmary; Burton-on-Trent Hospital; and the German Hospital, Dalston.

**SUB-CLASS II.—The double pavilion.** (Two pavilions joined together by corridor with a central administration block.)

I have illustrated the Royal Infirmary, Preston, as an example of this class. The central administration block faces south, and is separated from the two ward blocks by corridors 40ft. in length. Each ward block is divided into two unequal parts by a continuation of the corridor, the staircases being placed at the points of division. The south wards contain twenty-four beds with properly disconnected sanitary blocks at the south end, and with a loggia arranged between the two projecting blocks. The north wards are casualty wards for eight beds, and with two rooms for single beds adjoining. In addition to the buildings illustrated, there is a group of three pavilions placed parallel to each other and connected by covered ways. These were

PAVILION HOSPITAL SUB-CLASS IV.—CIVIL HOSPITAL, ANTWERP.

mentioned are not yet built, but are included in the scheme.

There are a very large number of hospitals of this class, all more or less modern. I may mention St. Thomas's Hospital, London, the Hospital for Incurables, Dublin, Leeds Infirmary, and the Royal Infirmary, Edinburgh.

SUB-CLASS IV.—Circular wards, either isolated or connected by administration block.

The new Town Hospital, Antwerp, was the first hospital arranged with circular wards, and was designed by M. Backelmaus, of Antwerp, but carried out by his pupils, MM. Bilmeyer and Van Riel. The ward pavilions are eight in number, and two stories in height, connected together, and to the administration, chapel, and dispensary blocks, by a corridor on the ground floor and a flat roof on the first floor. Each pavilion consists of three parts:

- (1) An entrance block containing three separation wards, the main staircase, a lift, and service rooms.
- (2) The ward block for twenty beds with Sisters' room in centre.
- (3) The sanitary block, containing water-closets, baths, lavatories, and kitchen.

The bath house is very complete, and contains several medicated baths, in addition to the ordinary baths.

Other hospitals of this class are at Hastings, and the Victoria Hospital, Burnley.

SUB-CLASS V.—A combination of circular with rectangular wards.

The Liverpool Royal Infirmary, erected in 1888-9, from the designs of Mr. Alfred Waterhouse, is a good example of this class. It would appear as if the exigencies of the site necessitated the adoption of the circular wards on the north side of the central corridor. In other respects the plan is similar to others in the multiple pavilion class. The Great Northern Central Hospital is another hospital of this class.

SUB-CLASS VI.—Isolated pavilions, with no connecting corridors.

Most of the examples of this type are to be found on the Continent and in America, and, as a rule, a much larger site, in proportion to the number of beds, is obtained than is usual with either of the before-mentioned classes. The essence of this system is the separation of the wards from the rest of the hospital, and

the perfection of the system is attained when not only each pavilion is cut off from the administration and other pavilions, but when each pavilion is but one story in height.

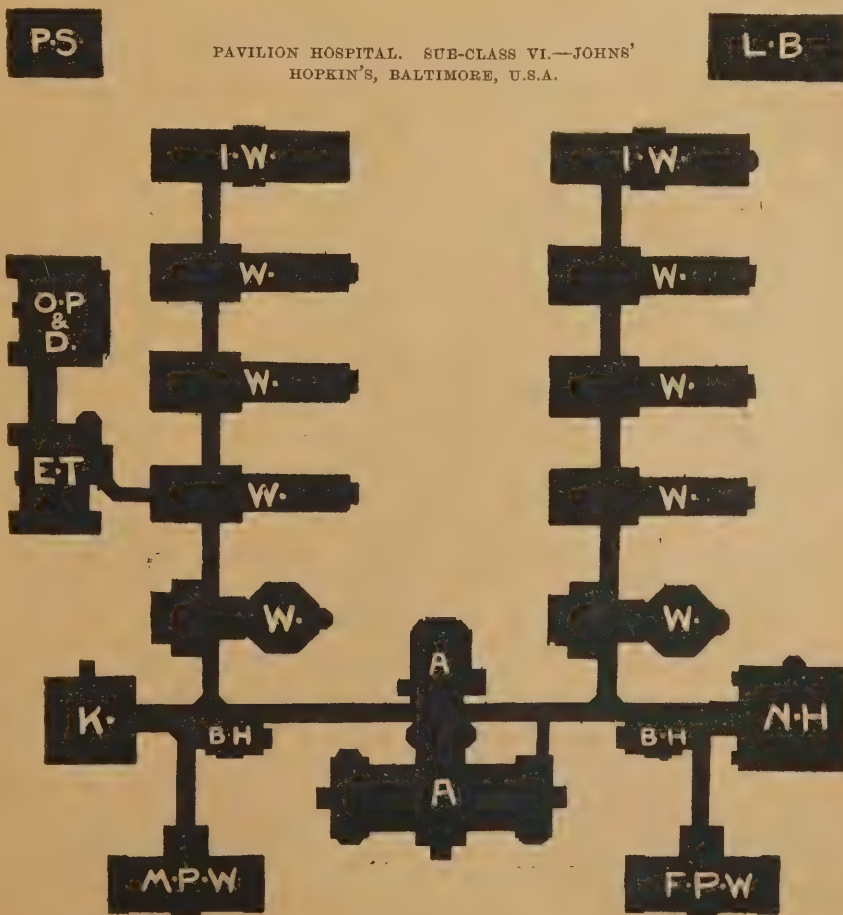

The Johns' Hopkin's Hospital, Baltimore, U.S.A., is probably the most perfect hospital in the world, and is the result of the utmost care, forethought, and research. Sixteen years were fully occupied in designing and completing the hospital, which consists of twenty-one buildings, twelve of which are

ward blocks—five of these blocks on the south side still, however, remain to be built. They consist of a ground story and a basement, and are connected together by a covered corridor, which is on the level of the ground floor of the administration buildings, and on the basement floor of the ward pavilions. A reference to the block plan will show in what way the several buildings are occupied. Other hospitals of this class are the Friedrichshain Hospital, Berlin, the Cantonal Hospital, Aarau, Switzerland, and the Municipal Hospital, St. Denis, Paris.

(To be continued.)

NOTE.—Index to Plans.—A, Administration; W, Wards; I W, Isolation Wards; O W, Ophthalmic Wards; M P W, Male Paying Ward; F P W, Female Paying Ward; O P D, Out-Patients' Department; D, Dispensary; E T, Operating Theatre; E, Operating Room; P S, Pathological School; M S, Medical School; B H, Bath House; N H, Nurses' Home; K, Kitchen Block; L B, Laundry and Boilers; M, Mortuary.

A BILL has been deposited in the Private Bill Office of the House of Commons by the Southwark and Vauxhall Water Company, to enable the company to increase the quantity of water it may take from the river Thames. The preamble recites that by an agreement between the company and the Thames Conservators, made in 1886, it was arranged that the former might take in any twenty-four hours from midnight to midnight any quantity of water from the Thames not exceeding in the whole 24,500,000 gallons. The demands upon the company have increased, and during recent years it has from time to time taken more than that quantity. An injunction was accordingly issued, at the instance of the conservators, by the Queen's Bench. The Bill proposes that the company may take from the Thames as much water as may be required for the purpose of fulfilling obligations imposed by statute up to 45,000,000 gallons per day; but there is a proviso that the company shall not take more than 24,500,000 gallons per day when the flow of water over the weir about to be constructed by the conservators across the river at Penton Hook is in such day less than 300,000,000 gallons.

### THE SHEFFIELD REFUSE DESTRUCTOR.

THE fires were lighted at the new works in Lumley Street last week, and a method of refuse destruction has been commenced which will, it is said, revolutionise the system of disposing of rubbish. The "Warner's Perfectus Destructor," which has been erected for the Corporation, is guaranteed by the inventor to dispose of either wet or dry nightsoil, by a method which will not cause inconvenience or annoyance to the public. In 1892, the idea of a destructor on modern principles was adopted, and a piece of land was secured in Lumley Street, by the side of the canal. Messrs. Goddard, Massey, and Warner, of Nottingham, are the contractors for the mechanical part of the work, the system employed being named after a member of that firm. Messrs. Longden and Sons were the contractors for the buildings, and the work was commenced two years ago. The site certainly lends itself to the purpose for which it has been adopted. The carts containing the refuse will be driven in on a level roadway and, over a small bridge, will go round to the top of the destructor, where the contents will be tipped on to a sort of platform, in which there are six holes or "hoppers," through which the rubbish will be shovelled into the six cells, where the process of combustion goes on. Several feet lower than the feeding holes are the furnace fires, at which the stokers work, and from these outlets the "clinkers," or the residuum after the burning process, are drawn out and wheeled round to a shed, in which there is a grinder, and waste is thus prevented, as the burnt refuse, when ground, is supposed to be excellent material for mortar. There are, too, fanners driven by an engine, which will regulate a draught by which the fire may be accelerated. Another important feature is the fact that sufficient heat is supplied from the destructor to generate the steam required for two engines, one of which drives the fanners, and the other works the mortar grinder, so that the refuse burns itself and grinds itself into a useful commodity. At the present there is only one boiler, but there is room in the shed for three others, and the destructor has been so constructed that other cells may be added. Thus, with the extension of the work of the destructor, provision may be made for turning the heat produced to other useful purposes. In addition to the engine-shed there is a store-room, with an office partitioned off, and through this room also runs a shafting from the engine to which a belt for a lathe, or any other machine may be attached. A very large portion of the site is still unoccupied, and, of course, it will be quite possible at any future time to conduct other operations on the land, or to work dynamos for electric light by the heat from the furnace, and the close proximity of the canal will be a decided advantage. There is no residential property close by, and the chimney stack is 180ft. high, and is connected with the furnace by a long underground flue, in which the dust is much distributed before it reaches the chimney. The flue can be easily cleaned, trap-doors being let in the side for the purpose. The present capacity of the destructor will allow of 60 tons being burned in twenty-four hours—that is to say, ten tons per cell, and the residuum is at the rate of 15cwt. from ten tons. With regard to the cost, the site (5a. Or. 10p.) cost £7763; the building contract was £6002; Messrs. Goddard, Massey, and Warner's contract was £2207; the paving of the road leading to the premises cost £4166, and some £300 must be added for paving round the building, making a total in all of £21,208.

At Hornsea, the District Council proposes to borrow £1300 for works of water supply, and £300 for works of street improvements.

The Public Health Committee of the Derbyshire County Council has held an enquiry into the proposal to erect a Joint Isolation Hospital for the use of the Bakewell Rural District Council and all the Urban Authorities within the Union.

### Surveying and Sanitary Notes.

MR. R. O'BRIEN-SMYTH, C.E., Inspector Local Government Board, has held an inquiry at the Town Hall, Blackrock, as to the sufficiency of a scheme framed by the Town Commissioners of Blackrock for providing new dwellings for persons of the labouring class to be displaced out of an area which had been declared unhealthy under the Working Classes Act, 1890. —Mr. R. Finlay Herron, secretary to the Commissioners, stated that they proposed to erect twelve three-story houses and ten two-story houses, with suitable sanitary accommodation. —Evidence was given to show that in all 109 persons would be displaced; that in some cases as many as eight persons were living in one room, and that all the houses were of a most wretched description. —The Inspectors suggested tiled floors in the living rooms, instead of concrete, which was more difficult to keep clean, and absorbed moisture, and intimated that he was satisfied the scheme was sufficient and suitable.

THE Bath Sanitary Committee has agreed to allow £2750 in the estimate for the ensuing year for sewer work. This is £500 higher than last year's estimate, but it has been explained that £450 was for excavating and cleansing the river banks.

WITH regard to the proposed scheme for North Walsham waterworks, a correspondent writes: It has been suggested that the sinking of more wells here is a very pressing necessity. It is true that by this means the supply would be increased, but it is also true that the quality would not be improved. All the water drawn from the depth of the existing wells is more or less contaminated, as it is all derived from springs on the same level. It has been ascertained that to sink isolated wells to such a depth that pure water could be obtained, would be a more costly method in the long run than the erection of what are commonly known as waterworks. Therefore, under the guidance of an eminent engineer, the District Council has now before it a scheme for such waterworks. The cost of the scheme at present under consideration is approximately estimated at about £4000. Should this be adopted, it is proposed to raise the sum required by a loan, extending over a period of sixty years. The interest on this sum, and the annual reduction of the loan, would be met by a charge on the rates. To those to whom the idea of waterworks and the consequent charge upon the rates is unwelcome, it may be pointed out that the well-nigh universal adoption of waterworks in all urban districts proves that no other method can be suggested which meets the necessity of the case so well.

THE Engineer to the Commission of Sewers (Mr. D. J. Ross) has issued his report on the works executed by that body during the last twelve months. The report states that the total length of sewers constructed during the period under review was 351ft., while no fewer than 232 premises were thoroughly drained. Referring to the proposed widening of Cheapside at its junction with Newgate Street, the engineer says: "The importance of widening Cheapside at this spot may be gathered from the fact that observations taken of the traffic on June 19th, 1896, show that 16,650 vehicles passed through the junction of Newgate Street and Cheapside during the twelve hours from 8 a.m. to 8 p.m., the width at that spot being only 27ft. 7in. from kerb to kerb." The number of arc lamps for the lighting of the City by electricity has increased to 493. The consumption of gas by the incandescent burner is 4ft. per hour, whereas the ordinary flame burner consumes 5ft. per hour, while the cost per annum of the former averages £4 7s. 3d. each, as against £3 6s. 4d. for the latter. The cost of the water used in cleansing the streets, &c., was £3720 16s. 10d., as against £3425 16s. 8d. during the previous year. Beneath the City

streets there are nearly one and a half miles of subways, the total length of mains, tubes, &c., amounting to seven and a half miles. During last year 4717 workmen and others were admitted, under supervision, to these subways. The work of cleansing the streets is, as the engineer points out, well done. Its extent can be understood when it is considered that over a million people and nearly a hundred thousand carriages enter and leave the City daily, and that out of that number more than three hundred thousand persons pass the day within the City. The quantity of water used during the year for washing the streets and courts was about 24,169,642 gallons, and the number of nights when it was used was about 259.

A FRESH scheme for protecting the eastern foreshore of Brighton has been prepared by the Works Committee for the approval of the Town Council. A scheme was brought up two months ago for erecting a sea-wall and a concrete groyne, at a cost of about £36,000, but was deferred for various reasons. The amended scheme will cost only one-third of the former estimate—namely, £12,000. It provides for two groynes, each of them being only 450ft. long from the south side of the road. Instead of a sea-wall of more durable material, a timber breastwork is to be provided of an inexpensive character, as it is hoped that it will soon be buried by the shingle.

THE foundation stone of the new public baths in course of erection in Kingston-on-Thames was laid on the 31st ult.

COLONEL J. T. MARSH, R.E., Local Government Board Inspector, held an inquiry at the Stonehouse Town Hall recently into three applications by the District Council: (1) for sanction to borrow £5500 for the purchase of the premises known as Pomeroy's Corner, for the purpose of setting back the frontage and improving Chapel and Edgcombe Streets, (2) for permission to raise a loan of £1300 for the purchase of premises in Strand Street for use as a stoneyard and depot; and (3) for the provisional order under section 303 of the Public Health Act, 1875, to partially repeal and amend the East Stonehouse Water Act, 1893, so as to provide for the abandonment of so much of the scheme for the supply of water by the Corporation of Plymouth to the District Council as was contained in clause two of the agreement scheduled in the Act, and substitute other agreed provisions, and to empower the District Council to borrow money to carry out works pursuant to such provisions. It was explained that the property the Council sought to acquire in Strand Street was Lucas's Wharf, fronting the Pool. At present it occupied a stoneyard in Newport Street, under a yearly tenancy. But it was liable to ejectment in the event of the site being required for building operations, and it was considered desirable in the interests of the town to purchase a depot. The leasehold interest in the property could be purchased for £868, and Lord Mount Edgcombe had agreed to sell the reversion for £300, so that for £1168 the Council could acquire it as a freehold property. The balance between that amount and the sum sought to be borrowed was required for adapting the premises for the purposes of the Council. Discussing next the application to borrow £5500 for the improvement of Pomeroy's Corner, it was explained that the Council originally intended to widen both Edgcombe Street and Chapel Street at that junction by setting back and curving the line of frontage at Pomeroy's Corner. Not only would a great improvement to the neighbourhood be thereby effected, but the Plymouth, Stonehouse, and Devonport Tramway Company, whose cars serve the three towns, would be enabled to substitute a double line for the single line which at present traversed that part of their route, and to improve the curve which now, owing to the angle of the corner, was extremely sharp. Including the freehold, the total cost of the property would be £4850, and the balance of the loan asked for was required to set back the property and carry out the necessary alterations in the roadway.

### The New English Art Club.

WE are accustomed to look to the Dudley Gallery twice a year

for the latest thing in "impressionism," whether in the treatment of incident, in Architecture and landscape, or in portraiture. The present exhibition of the New English Art Club shows a good average of clever work rather than any great and memorable masterpiece. No such distinguished guests as Whistler or Sargent grace the walls, but most of the leading spirits of the club—P. Wilson Steer, Henry Tonks, Moffat Lindner, Walter and Bernhard Sickert, Arthur Thomson, R. Anning Bell, and C. W. Furse—are strongly represented; while the black-and-white school—led by Phil May, Bernard Partridge, and Will Rothenstein—are regrettably absent. W. Sickert sends an imposing and elaborate painting of St. Mark's, Venice. Bernhard Sickert's "Ponté della Trinità" is set in a more poetic key, but his brush is still more sympathetic in "Poole Harbour" and "The Quay, Boulogne." A comparison of these four works with George Thomson's "Westminster Abbey" on the one hand, and on the other with W. H. Y. Titecomb's pearly Venetian visions, or the "Stockholm" of Jane Inglis, will illustrate forcibly, though by no means unkindly, the difference between an Architectural painting and a picture. However powerful and valuable a close front view may be painted, as one may say "without prejudice" (which often means without emotion), it rarely becomes pictorial, save under some happy accident of mist or sidelight requiring the finest artistic qualities to utilise at a few feet's distance; and as expressions of the spirit of an Architectural style, such aspects as this of St. Mark's and Westminster Abbey are colourless and void. Ecclesiastical Architecture, above all other, seems to demand space and atmosphere before it will reveal itself with any dignity or charm. A dwelling-house is more amenable to intimacy of treatment—witness the beautiful old homestead in the foreground of "The Minister's Daughter," by James Charles, in which the mellow tenderness of every brick invites us closer to the hospitable door. The "Dover Castle" of J. L. Henry and the "Christchurch Bay and Harbour" of Moffat Lindner are fine in a yet different way. Several of the portrait-painters have attempted difficult mirror effects with varying success. "Mrs. Cane," by C. W. Furse, is notable not so much for the double portraiture obtained by the looking-glass as for the daring and yet remarkably tolerable discord between the mauve curtain and the lady's cloak of rich electric-blue. But this is a year of blatant blues with variations in violet; and the eye that can endure G. Thomson's "Blue Gown" has little else to fear. "Blind Man's Buff," by Henry Tonks, is a remarkably vigorous study of an "Early Victorian" drawing-room, glassy, and slippery, and cold, with shot silks and shiny chintzes and mirrors in twisted gilt curls. In catching the indescribable sheen of such a room, the Artist has done a cleverer thing than any direct mirror-painting. R. Anning Bell's "Mother and Child" is unsurpassed for simplicity of drawing and purity of colour, and among the large number of exhibits occupying the walls of the gallery no one should miss the brilliant little pencil study, "Stitching," by A. H. Studd. It is worth more than a passing glance.

### Two Unsolved Problems.

IN a recent issue we dealt at length with the important question of extending the Government Offices. But there are two other questions, perhaps of greater importance and more pressing than this extension scheme, calling for a practical solution at the hands of the Government. The vexed question, "How is the Wallace Art Collection to be housed?" yet remains unanswered, though innumerable suggestions have been made on the subject—and the much-needed completion of the South Kensington Museum is a topic of animated controversy, growing in popularity almost daily. The Wallace Collection is too great a bequest to the nation to approach the subject indifferently, or to deal with it otherwise than in a liberal spirit. Representative of almost

that Hertford House should be adapted for retaining its treasures; secondly, it is suggested that an annexe should be built to the National Gallery; and, thirdly, that an annexe be built to the South Kensington Museum. Of course, much might be said in favour of each of these alternatives, but, considering all the facts, we are inclined to think that the proposed annexe to the National Gallery is the project most heartily to be recommended. It would certainly be the most costly, inasmuch as, if carried out on any pretensions scale, it would involve not only the taking over of St. George's Barracks, but the demolition of several houses in the neighbourhood of St. Martin's Street. And it is this latter necessity which induces us to favour the National Gallery proposal, for by the removal of the houses in question an un-

Early English Doorway  
LANDAFF (ATHE)RAL

SKETCHED BY L. EDMUNDS.

every school of painting, and numbering masterpieces by Reynolds, Gainsborough, Watteau, and Greuze, the Wallace Collection is undoubtedly unique; and whether we are prepared to accept the enormous estimates of its pecuniary value which have been so extensively set forth, it is positive that many pages of English history will be written ere the artistic wealth of the country is again so handsomely enhanced as by the Lady Wallace's bequest. Why not, then, a suitable home for the treasures? A suitable home will no doubt be provided in due time—or perhaps undue time. The Government cannot overlook the necessity, for it is a condition of the gift. Where, then, can the collection be contained? So far, the Government has three alternatives. Firstly, it is suggested

doubted source of danger—by reason of their proximity—would also be removed. St. Martin's Street would have to be carried down to Pall Mall, and it is clear that, were such a project carried out, not only would the isolation of the National Gallery be secured, but a very real improvement would be effected. The question of cost would certainly be a somewhat serious matter. But ought the Government to base its actions too largely on economic considerations in dealing with this unprecedented gift to the nation? To both the other alternatives there are weighty objections. The South Kensington Museum sorely needs every inch of available building space for the proper display of its own Art treasures, and Hertford House is not at all suited to contain a public collection, nor

is it clear how some of the difficulties in the way of its becoming suitable are to be overcome. The question is for the Government, and the Government only, and one would like to hear of practical steps being taken towards a solution. And then as to the second problem—what is to be done with South Kensington Museum? The question has been discussed and re-discussed, and we seem as far off a solution as ever, though it is greatly to be hoped a due sense of the fitness of things, as well as the exigencies of space, will lead to, if not the erection of a building worthy of its important purpose, at least the completion of the present Museum. "It is not in the least necessary to have an ornate and costly building such as the soul of the modern Architect delights in," said the Times in a leading article a few days ago, but surely the Museum should be imposing enough to give some impression of its national importance!—And we would inform the Times correspondent that a good design is not more costly than a bad one.

#### BUILDING ACTIVITY IN LEEDS.

NEVER since Leeds was built were Architects and builders so busy as they are now, and are likely to be all this and part of next year in that quarter of the centre where the railway stations, the new Post-office, and the principal hotels are. Most of the many enterprises by which this central district is being transformed have been briefly mentioned in these columns from time to time; other projects are now being mooted which hitherto have only been the subject of rumour. The old Post-office is to be pulled down forthwith, and a slice of the site thereof having been added to Infirmary Street, the remainder of this "highly eligible" space will be submitted to public competition. Quite within sight of the ancient edifice last mentioned, three new banks are in various stages of progress. Two of them, externally, seem to be approaching completion; the other is rapidly appearing above the level of Boar Lane at the bottom of Park Row. Further down Bishopgate Street

#### A GREAT GAP

has been created at the south-eastern corner of the Queen's Hotel, which is to be filled by an extensive addition to that inn. A little further eastward, the Griffin Hotel is having a big wing added on the southern side. Important as these undertakings are, Architecturally and otherwise, they are, of course, overshadowed by the enlargement of the New Station, which appears to be making headway on the slow-and-sure system. The new platforms at the north-east corner are nearly all covered in, and new booking-offices are gradually ascending upon the site of the old parcels and superintendent's offices. The construction of the cab rank has not yet been started, and the offices occupied by the stationmaster and the lost luggage department still impede passengers in search of their trains. Nevertheless, a vast deal more space, light, and air are being provided both for the public and the railway officials, and further improvements are to be taken in hand. This forward movement has also extended westward to the surroundings of the Great Northern Station. The hotel of that company is to be enlarged and further adapted to present-day requirements, and the foundations and basement of the Hotel Metropole, in King Street, are nearly completed. East Leeds is not an attractive suburb. Nevertheless, the probability is that the near future will see a considerable part of this outlying district converted into one of the popular residential quarters of the city. Two circumstances are making for that end. One is the extension of the tramway, and the other the scheme for abolishing the insanitary area. The first item on the programme of improvements is the clearance of old, unhealthy property verging on York Street, and with it the widening and practical reconstruction of that thoroughfare. That is a matter which the inhabitants may reasonably expect to see

carried out at a comparatively early date. As for the tramway, the York Road portion is already in course of construction; half of it, indeed, is nearly finished. Within measurable distance, therefore, it will be possible for residents on the road to Halton to get into Leeds by a quick service of trams in a few minutes; and the fact that there will be a decent thoroughfare to leave town by, must inevitably bring many to live in this neighbourhood who at present avoid it. Compared with some other localities, East Leeds has not developed to any very great extent. Within the past year or two, however, building enterprise has been noticeable. The demolition of the Marsh Lane tunnel led to a good many structural alterations; and the opening out of

Growth of this kind is inevitable. Apart from the question of doing away with the insanitary area there are the railway developments to be considered. In the valley, by Knostrop, the North-Eastern are laying down extensive sidings for the purpose of their new goods depot connecting with the Great Northern Railway Company's Hunslet branch; and in course of time East Street, which is on the direct route to Knostrop, will require widening. So far the most important feature in the general project is the near provision of a good wide, cleanly road from the covered market to the country, and the certainty that the adjacent main streets will have to be similarly improved. At the point where the York Road tram has its present terminus five roads meet;

SCOTTISH PLASTER: DRAWN BY JOHN MURRAY.

the Park and the Ivy House Estate has been another gratifying feature.

#### THE NEW TRAMWAY,

which measures rather short of two miles from end to end, will have its terminus near the entrance to Ivy House estate—at the corner of Victoria Avenue, to be precise. Already about a hundred new, neat dwelling-houses look out upon the trim grass borders and young trees of this avenue, and there is room for twice as many more. A little farther on a large portion of the estate, which the Corporation has sold to various persons, is being laid out in streets, and it is not difficult to foresee the time when, the tramway completed, houses will spring up on every side. There appears to be plenty of land available for building purposes. Here, too, it is proposed that the Corporation shall erect working-class dwellings to accommodate occupants of the insanitary area when they are turned out of their present homes. Nearer the town, namely, on Richmond Hill, which is about the same elevation as the Ivy House estate, though more thickly populated, an open space of some half dozen acres is already being covered with new cottage houses and shops.

one of them—Burmantofts Street—is being widened for the tramway connection with Roundhay Road, and it would seem that the turn of Quarry Hill and Marsh Lane also is bound to come. At this particular meeting-point a spacious square will be formed by the removal of the Shoulder of Mutton Inn, which the Corporation has now acquired.

THE second volume of Mr. Edwin O. Sachs' monumental work, "Modern Opera Houses and Theatres," will be issued early in May. The liberal support afforded by the subscribers has enabled the author to materially extend his original programme, and no less than 300 well-known play-houses will be dealt with. Sixty theatres of recent date representing Austria, France, Germany, Great Britain, Greece, Holland, Italy, Roumania, Russia, Spain, and Switzerland, are now fully described on 200 large folio plates in the first two volumes, and there are nearly 1000 views, sketches, and diagrams distributed in the text. Mr. B. T. Batsford, of High Holborn, is the publisher, and the third volume will be ready in December.

## Scottish Plaster Work.

(Concluded from page 122.)

By JOHN MURRAY.

The illustrations of Keltie Castle have been kindly lent by Mr. R. S. Lorimer; the whole of the others are from original drawings by Mr. John Murray.

THE great variety of effect gained by the use of broad and narrow ribs, heavy and elaborate, and also comparatively simple, is very marked in the examples at Binns Castle, Linlithgow. One is composed of plain ribs forming squares and circles. The ornament is of simple design, and is chiefly composed of stars, crescents, and monograms. The other ceilings in the same house are very heavy in detail and ornament. In one room there is a deep frieze of festooned fruit and foliage. In another room the ceiling is coved, and the ribs curve downwards and terminate with decorated pendants, as at Moray House; in fact, the whole detail bears a considerable resemblance to Moray House work.

There is another style apart from the rib and strap work, and of it there are fine examples at Hatton House, Saughton House, Holyrood, and several other places. There was one example in Edinburgh, in what used to be Bartholomew's printing and map-mounting offices at the head of Chambers Street. I do not know whether it is still preserved or not. At Hatton House there is a large central oval with festooned fruit and foliage, and the central portion left for painting and decoration. The portions outside the oval are filled with fruit and flowers in very high relief.

I think I have exhausted most of the ex-

ST. MARY'S HALL, LAWN MARKET.

Corrice

FRENCH AMBASSADOR'S  
HOUSE: COWGATE:

DRAWN BY JOHN MURRAY.

amples preserved to us in country mansions, and will make a few remarks on those that were executed during the same period in Edinburgh. Possibly some will remember the block of old timber-fronted houses that stood at the corner of the Lawn Market, and the West Bow, although it is some time since it was taken down: about 1878-79. There they stood as they were erected some 335 years before. It is not to it that I would draw your attention, but to the house next, which was also demolished about the same time. On the second floor of that tenement there were two ideas for interlaced ceilings. The ribs were plain moulded, the one about 3in. broad and the other about 3½in.

Of the many town mansions (at that time) of the prosperous city merchants of the sixteenth century, Baillie Macmorran's is one of the very few that survives. It is reached by Riddle's Close from the Lawn Market. In one of the rooms on the first floor there is a well-preserved decorated ceiling. The ribs themselves are plain, and run in the form of squares and circles, and the panels thus formed are filled in with modelled stucco. I give an illustration from a drawing of this ceiling, which was one of a set that gained the first prize given by the Architectural Association a number of years ago. I also give two more examples from St. Mary's Hall, Lawn Market, of the dates 1645 and 1646. The pattern formed by the ribs in one is exactly similar to the one in the tenement in Lawn Market, of which I have already spoken. The other is of slightly different design, and both have enrichments, but not of a heavy nature.

In what used to be the French Ambassador's private chapel, there was a ceiling of very simple design. It was formed of circles and diamonds alternately. The ornament was small and there was little of it.

From Croft-an-Righ or Field of the King, we have another ceiling typical of the style prevalent during the early part of the seventeenth century. There is a marked similarity, too, between it and the one in Baillie Macmorran's house, both in ornament and forms taken by ribs. To quote a paragraph from

CROFT-AN-RIGH. DRAWN BY JOHN MURRAY.

"Domestic Architecture of Scotland," it says: "No satisfactory history of this house is known. The Earl of Moray is supposed to have resided here in 1564, but it appears to us doubtful whether it is as old as that period." It is also supposed to be the house purchased by William Graham, Earl of Airth (who died in 1694) from the Earl of Linlithgow." Then again the history of Holyrood states that it is an edifice of the sixteenth century, and was the residence of Regent Moray, and with its gardens was "gifted, along with several adjoining properties, by James VI. to a favourite servant of the name of French." This all goes to show that the ceiling is of a later date than the building itself.

As a last example, I would mention a house in the Grass Market, which was taken down in 1877. Here, the ceilings were much heavier in detail and ornament than the strap and rib style, and more inclined to the style of Hatton House, &c. The centre panel was in the form of an octagon, and the corners left were filled in with a shield, lion rampant, and scrolls.

With regard to the later style of plaster work as executed by William Adam and his son Robert, I will add a few remarks. William Adam practised as an Architect in Edinburgh early in the eighteenth century. He died in

1748, and was buried in Grey Friar's Churchyard. During his career he erected many notable noblemen's mansions throughout Scotland. The style he adopted was purely Classic, and for about a century after his time it retained a firm hold as the prevalent style for all buildings, for those of even the very least pretensions. Let us take Drum House, for instance, as an example of his work. It is in close proximity to Edinburgh, about four miles distant. The plaster work here is of the most elaborate kind. The dining-room ceiling is also very rich with effective and delicate detail; this room is also after the style of Hatton. A portion of it is divided off by Ionic columns and flat arches, perhaps a revival of the screens in the halls of old castles. The archivolt and soffits of the arches are enriched. Of the younger Adams' work we have many examples in Edinburgh in houses in York Place and Queen Street for instance. Many of the ceilings of the outer lobbies are ornamented. Large ovals with festoons of flowers round the ovals are common. Some are just composed of festoons and a large central ornament, others again are of diamond shape. There is great variety in forms and designs, which drawings only could adequately describe.

Now I will go over briefly the principal

points that present themselves to us in the work I have just tried to explain. In the early Scotch Renaissance work, the use of the broad and narrow ribs lends great variety to the designs of the period. There is also some variety in detail; beads, cavettos, ogees, and segments of circles are all used in the formation of the ribs. The section of the Berwick rib is quite an exception. In the forms made by the ribs there is a great similarity. This is generally the case down to the examples at Hatton House, &c., which are pure Italian. Those at Drum House have a distinct French feeling about them. In studying the work it is seen that there is a tendency towards heavier detail and ornament from about 1640. The ceiling of the house in the Grass Market is an example of this. There seems to have been a change of feeling about every twenty-five years.

Some ribs were run by the hand with the use of rods as guides; others, again, were run by means of a crude mould. The ornament was also hand-wrought, and is easily distinguished from cast work now used. It was chiefly done by Flemish Artists and Italians, assisted, of course, by native workmen. The designs are also due to these foreigners, I believe. The raw material was stuck on the walls and ceilings, and modelled where it was intended to remain. The free, wavy lines are very marked, as compared with the straight lines and sharp outlines and regularity of cast ornament. I do not say that hand-wrought work is preferable to cast work, although, perhaps, more artistic. Personally, I much prefer the sharp and clear outlines gained by casting. It adapts itself better to the Decorator's Art, too.

We find a marked similarity in the ornament. Perhaps the drawings, like the workmen, went the round of the jobs. That might save expense, too, which would probably be as great a consideration then as now.

I have taken note of, I might say, four different styles; the Early Scotch work, with ribs and strap work, the style of work at Hatton, which forms the link between the early work and that at Drum House, which is again a mixture of Hatton, and the Italian work of the younger Adam.

Of the four styles I think that of Hatton is the best, and the one to use if the money were forthcoming. The ribs and strap work have had their day. The work of the younger Adam is very fine and light, and easily marred by layers of whitewash, and would necessarily need a lot of cleaning.

I would like to say in closing that I think plaster work is worth as much study as either wood or stone detail. Good plaster detail, mouldings, and ornament will hold their own with any other branch of our Profession, and they go far in giving a refined air and rich appearance to the interiors of all buildings.

[In our last issue this Article was attributed in error to Mr. R. S. Lorimer. The illustrations of Kellie Castle only are by Mr. Lorimer, the Paper being by Mr. John Murray, as also the whole of the other illustrations.—Ed.]

The foundation stones of a new Wesleyan Chapel for the village of Cropton, near Pickering, were laid last week. The building is estimated to cost £630.

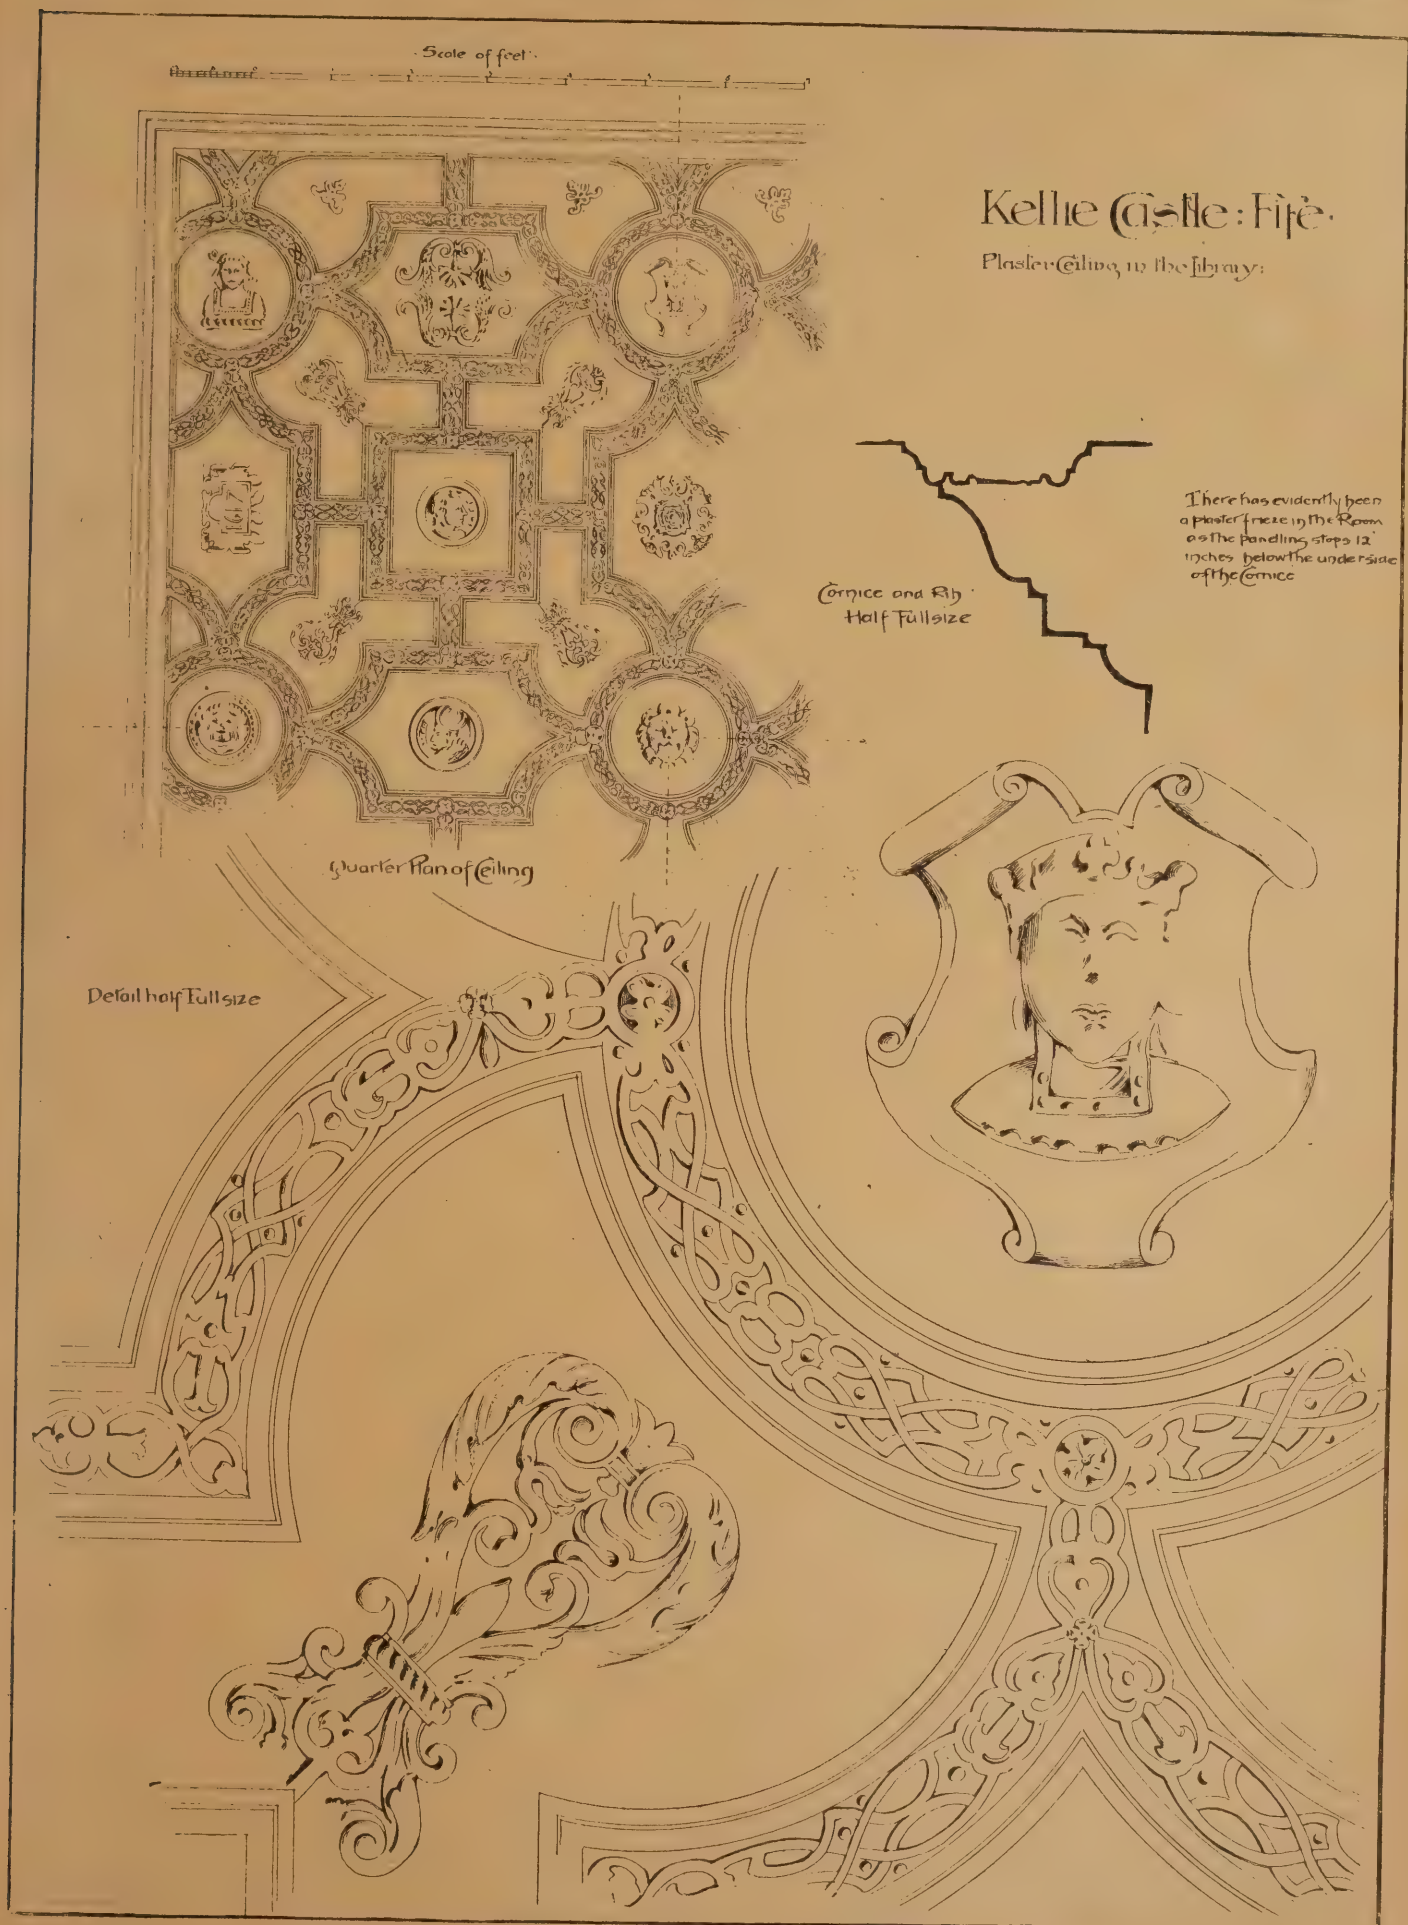

An effort is being made to raise £9000 in order to build two new chapels in Kingsley Park and Wellingborough Road, Northampton, two rapidly growing districts of the town.

It has been decided to build a new room in the Protestant Hospital at Nice for the use of British patients, to be called "Queen Victoria's Ward," in commemoration of the Diamond Jubilee.

The inhabitants of Poulton, near Fleetwood, have adopted a commemorative scheme for improving the streets by purchasing and demolishing old house and cottage property. The estimated cost is £3000.

The directors of the Great Western Railway Company have sanctioned a series of important extensions at the Llanelli railway station, including the extension of the covered way as far as the water-crane. The work will cost little short of £1000.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
April 14th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A CORRESPONDENT calls attention to the singular effect which the recent beautification of the Egyptian Hall of the Mansion House has had upon the marble statues in that noble chamber. These statues, he remarks, gleamed snow-white so long as the hall was in its old sombre condition, but now that a light and pleasant design of decoration has been carried out they appear—at all events by daylight—a dull grey, as if moulded in putty. The change seems to have been brought about by the light chocolate or terra-cotta colouring of the niches in which the statues are placed. The only means of restoring the beauty of the statues would seem to be a darkening of the niches, but as they are at present in harmony with the general scheme of colour, an interference with them may have unexpected consequences. It is singular that these statues should have been overlooked, seeing that they form so fine a feature of the hall.

MR. PENNELL has won his action for libel, and the damages have been assessed at £50. The verdict seems to be a proper and just vindication of a distinguished Artist, whose methods in every form of black-and-white work could hardly, we imagine, be seriously impugned. If in the matter of what is or is not a properly produced lithograph, Mr. Whistler—one of the two or three great Artists of the century—agrees with Mr. Pennell, the matter really requires no further discussion. A "transfer" lithograph does not involve any subtraction from the skill of the Artist, or any substitution of mere mechanics for that essential skill. The effect of the two processes, as Mr. Shannon and Mr. George Moore admitted, could not be distinguished. Therefore, to state of Mr. Pennell that he had been using a "debased instrument," and to suggest commercial dishonesty, was to say, in other words, that Mr. Pennell, an original Artist of great repute, was akin to a kind of photographer. Mr. Pennell submitted this technical but important issue to a British jury, and has obtained from it a complete vindication of his status as a Craftsman. That seems to us a proper issue of the trial. Newspapers have much to bear, and far too heavy a burden falls upon them in connection with the general work of free criticism. But there is no reason why the individual contributor should be relieved of his personal responsibility for judgments that affect that precious possession—the integrity and the good faith of the Artist.

MR. J. MCNEILL WHISTLER, interviewed with reference to the action brought by Mr. Joseph Pennell referred to in the previous paragraph, says:—"To say that, because an Artist has been known to produce a work of Art upon stone, the work of the same Artist upon paper is an attempt to impose on the public an inferior substitute for what he had done on stone, is as though it should be urged that a canvas by Rembrandt were foisted upon the collector in lieu of a panel, with its peculiar qualities, by the same master.

The really monstrous issue brought before the jury was built up on the overweening insular naiveté of one whose dangerous knowledge has emboldened him in his lifetime to attempt the reputations of distinguished Artists, and to produce himself one lithograph on the very paper he condemns. Such colossal impertinences doubtless may darken the horizon of the Artist in England—yet there are in their wake compensations of grotesque joy beyond the wildest conceptions elsewhere. Who shall forget the little Arcadian interlude when there stayed in upon us the long unhopdfor 'Expert'! A sunny sense of hay and innocence pervaded the court as the ingenuous one, with the sweet emptiness of purpose that had brought him, aimlessly browsed his way into the fatal box. The gods alone, for the great glad laughter of those they love, could have prepared the beautiful bewilderment of court, counsel, and jury, as he stood beaming at the bar. 'Naught do I know of lithography—but I did know Degas!'—thus to us all. Angry counsel rose indignant at this late introduction of new and foreign 'process,' and the kind creature was straightway led forth to other meadows."

REGRET has often been expressed that Sir Christopher Wren's plan for the rebuilding of London after the great fire was not carried out, and it is quite certain that no accident of less magnitude than a gigantic earthquake will give any future generation an opportunity of reconstructing the City. Perhaps this is not altogether a misfortune, for, although the fine broad straight avenues and streets that were contemplated by Wren would have added greatly to the dignity of the First City of the World, the stiffness and conventionality of the plan would have sapped all individual efforts for the beautification of the main thoroughfares, and in the end London would probably have been less interesting, although possibly more impressive. It seems almost like sacrilege to imagine Fleet Street, with its labyrinth of courts and alleys, as a great central avenue leading from Charing Cross to Ludgate Circus. Still, it must be confessed that it is a great pity that Ludgate Hill was not constructed straight down from the western front of St. Paul's Cathedral, so as to open up a view of that noble pile standing at the top of the hill. Such a course is, however, now impossible, and the City loses the finest and most impressive view of St. Paul's that could have been obtained. As it was clearly impossible to straighten Ludgate Hill, the only thing that remained to be done was to widen it and improve it in every other possible manner. During the last ten years the appearance of the thoroughfare has entirely changed, and, were it not for the railway bridge, which spans the lower end of the road, the improvement would be much more noticeable.

THE usual weekly meeting of the London County Council was held on the 6th inst. at the County Hall, Spring Gardens, Dr. Collins presiding.—Mr. Beachcroft moved that the consideration of the report of the Special Committee on the Works Department, which we published in our last issue, should be adjourned until after the Easter recess. He pointed out that the General Purposes Committee, on the previous day, had considered the matter and had come to the conclusion that such a course was desirable. There were two other appendices, besides that already circulated, and it was thought that the Council should have time to consider the whole matter before it was discussed.—The motion for the adjournment was agreed to.

IN the Chancery Division, Mr. Justice Kekewich recently delivered judgment in the case of Viscount Hill v. Bullock, which involved the question whether a trustee in bankruptcy could remove for the purpose of selling for the benefit of the bankrupt estate of the late Viscount Hill a natural history museum. The plaintiffs in the action are the present Viscount Hill, the tenant for life in possession, and the trustees of the marriage settlement. The articles in dispute were in the ancestral mansion at Hawkstone, Shropshire. It was

alleged that these articles which had been collected by the plaintiff's predecessor in title had been made fixtures and heirlooms in consequence of the cases containing the specimens being attached and let into the walls, the specimens being supported in the cases by wires and screws.—Mr. Justice Kekewich, in giving his judgment, said it had been practically admitted by the plaintiffs that things which were generally treated as personal chattels and capable of being removed without injury to the structure belonged to the defendant in his capacity of trustee in bankruptcy. As to the question whether the contents of the museum belonged to the defendant, or must be treated as part of the freehold, he thought there was no difficulty in removing the wooden trays which carried most of the specimens, and therefore the contents of the cases must be regarded as movable personal chattels, unless they could be brought within some recognised exemption from the general law of fixtures. He held that they could not be brought within the exemption.—It was arranged that there should be a declaration that the cases were fixtures, but that their contents were movable, and belonged to the defendant. The question of the cost of restoring fixed tables that had been removed was referred to a local arbitrator.

THE terms of Lady Wallace's bequest to the nation have now been announced. The gift includes the pictures, porcelain, bronzes, artistic furniture, armour, miniatures, snuff-boxes, and works of Art which are placed on the ground and first floors and in the galleries at Hertford House, on the express condition that the Government for the time being shall agree to give a site in a central part of London, and build thereon a special museum to contain the collection, which shall always be kept together, unmixed with other objects of Art, and shall be styled "The Wallace Collection." The bequest does not include personal and modern jewellery, trinkets, and effects, nor ordinary modern furniture or chattels, but comprises the Louis XIV. balustrade at Hertford House, which the executors are directed to replace by an ordinary modern structure, so that the original shall be used in the new museum.

AN interesting and valuable piece of old silver plate has lately come into the possession of Messrs. D. and M. Davis, of Livery Street, Birmingham. It was sent by them to the Assay Office for inspection, and on examination was found to be the head of a beadle's staff, the Latin inscription on which had been partially obliterated by filing. Enough remained, however, to show that it had at some time been given to the parish of Bermondsey. An acknowledged authority on old plate was communicated with, and the staff was identified as one given to the Bermondsey National and Parochial Schools in 1720 by George Isaake, apothecary, and until some few years ago known to have been "in safe custody" at the parish Church of St. Mary Magdalene. The right to the staff having been so satisfactorily made out, Messrs. D. and M. Davis have restored it to the parish to which it belongs.

PICCADILLY will be considerably improved by an alteration which the Duke of Devonshire has sanctioned in the blank wall which at present hides his town residence from the street. The gates of Chiswick House are to be transported to Piccadilly, and placed in the centre of the present brick wall, which the liveliest imagination could hardly describe as picturesque. Workmen are now engaged in the requisite preparations.

IN about two and a half years' time the new Egyptological Museum at Cairo, the foundation stone of which has been laid by the Khedive, will be completed. The work, which was originally commenced in the spring of last year, but unavoidably postponed, is being carried out by a firm of Italian contractors resident in the town, but the air-tight cases for the Royal mummies have been ordered from England. A further museum of Arab Art, and a library of Arab literature, is also in course of construction.

VAUXHALL temporary bridge has now advanced to a stage at which it may be stated with some confidence that it may be open for traffic towards the end of the year. The pile-driving is all completed, and drawings are now in course of preparation for the remainder of the work. Some modification of the original plans for carrying out the work has had to be made, and there is now a clear waterway in the middle of the stream of 150ft., instead of 70ft. as at first intended. It was found that the drift of the tide rendered navigation difficult and dangerous, and the central pier which was to have remained has been removed, and the whole of the 150ft. will be spanned by girders. This has involved a considerable addition to the calculated cost, but as the structure is to serve first for the rebuilding of Lambeth bridge when that at Vauxhall has been completed, it is, of course, very important not only that it should last some years but that it shall not present any serious obstacle to traffic. The original cost was to have been £30,000. The alterations are estimated to bring it up to £42,800.

MR. J. T. PILDITCH, the Surveyor of Battersea, has presented a report to the Vestry as to the effects of certain works which the London and South-Western Railway Co. propose to carry out. The railway company desires to widen the line for a considerable length, and has scheduled a good deal of Battersea property. If the present plans are adopted, the old Battersea Grammar School on St. John's Hill will be demolished; the railway company will acquire a large portion of the works of the Battersea dust destructor; five public-houses will have to be pulled down, 392 houses will be demolished, and 3920 persons will have to find new homes. The railway company will take a large portion of the Latchmere Allotments, as sites for artisans' dwellings, in which to house the displaced families.

THE fifth lecture of the supplementary course on Hellenic Architecture was delivered by Mr. William J. Anderson at the Glasgow School of Art. The lecturer looked away from the historical and social influences, which, though none the less real, were beyond the purview of the Artist of the time, and endeavoured to take the standpoint of the master confronted with a particular problem. Applying this treatment to the Propylaea, the object of the building was considered, the nature of its site, the alignment which Mnesicles, its Architect, decided upon in its relation to the Parthenon and to the Acropolis wall, the angle of which its axis bisected. This unusual position appears also to have been designed to give within the gates a stoa of equal length on each side, and without, two halls occupying each the same space, but of a varying arrangement, controlled by the position of the bastion carrying the Nike Temple. The various obstacles preventing the accomplishment of the scheme, and resulting in the present irregular arrangement, were considered in so far as they can be read in the building itself, while the fitness of the Architecture and the beauty of its details and painted decoration were shown by many illustrations. The Erechtheum was treated similarly, and, from its arrangement and other circumstances, regarded as a megaron in honour of Erechtheus, a monument and museum of many cults rather than a temple sacred to a god or gods, and in addition to photographs of its present state, restorations of its exterior and interior, illustrations of its relation to the complete Acropolis were exhibited. Additional examples of the culmination in Attica were illustrated in the Hall of Initiation into the Eleusinian mysteries and the temple of Apollo at Phigalia, the latter being included on the ground that it was the work of a great Athenian Architect. The second part of the lecture was devoted to the Greek theatre and games—the buildings of the theatre, Stadion and the Palestra, and in this connection were shown and explained plans and restorations of the huge assemblage of buildings at Olympia, the Apotheosis of athletics.

AUSTERFIELD Church, near Bawtry, is to be restored. The quaint old fabric is interesting

from its connection with the Pilgrim Fathers. Here was baptised William Bradford, "the first American citizen of the English race who bore rule by free choice of his brethren." The Norman font at which the holy rite was performed 300 years ago may still be seen, and the parish register shows the original record of that event. Bradford's descendants are permitted to erect a brass plate in the Church to the memory of the renowned Governor, and a suggestion has been made to build a new aisle on the north side as a further memorial. Some very interesting Norman work was last year discovered by Mr. Hodgson Fowler in the north wall, in the form of five pillars supporting three arches, and it is probable that there was a north aisle originally. The work of renovation is estimated at about £1550, towards which something like £1150 has been either

subscribed or promised, including a sum of £38 from America. The cost of the north aisle would be, probably, about £250.

Few provincial cities have made such vigorous municipal progress during the last few years as Bath. After building an entirely new suite of baths, the corporation has now completed a large pile of municipal buildings and a new School of Art and Technical Instruction. The city also—unlike London—is lighted with electricity in all the principal streets, and the Corporation proposes to complete its work by erecting a free library.

Now that the attention of the Sewers Commission is about to be paid to what has been described as the "objectionable hoarding" on Ludgate Hill, it is to be hoped that the inquiry will be extended to other hoardings that have disfigured the City for an utterly unnecessary length of time. There are not a few that constitute a standing eyesore, and answer no useful purpose save that of bringing in a certain sum annually as advertising stations. To mention but one, there is that looking on to Giltspur Street and facing St. Sepulchre's Church.

An old house which stands in Brockwell Park at Herne Hill has been turned by the County Council into a refreshment room. For the walls of the largest room in this building, Mr. Henry Strachey has designed a series of decorative pictures, with subjects chosen from haymaking. There are five of these panels, of which the best represents the hayfield at dawn. A mower in front is sharpening his scythe; the cold blue of the steel is echoed in a pool of water, and repeats itself more faintly in a chilly background of mist; to the left of the picture, on the second panel, a workman passes with his rake poised on his shoulder. In the companion picture of evening, boys build up a haystack, with the village houses soft in the subdued light beyond them. The panel facing the windows, which shows haymakers reclining in the grass by a stream, busy over five o'clock tea, is seen to great advantage.

OXFORD has lost all her exterior pargetting ("pressed-work" is, perhaps, the wiser term), except in one house, 41, Castle Street, and that

is weak in body and surface. On the south of the new Ashmolean Museum, fastened to a wall, are four very good panels from a house once Falkner's, now the Birmingham Bank, Corn Market, Oxford. They are worth seeing, and have been, long ago, coloured a warm orange. In the City Buildings Museum are (or will be very soon) four bits from the late police cells, taken down in February this year. One bit, from under a beam, is almost elegant; and the square panel used as a frieze round the early room much resembles a Venetian design in a book dated about 1620. The master of University College possesses a delightful drawing of an inn, called "The Three Tuns," which had some interesting pressed-work on its second story; it stood just west of the Shelley Memorial. A little house in the Hamel, St. Thomas's parish, was

decorated with a frieze of sibylls, not by the dozen, but by three repeated; of poor drawing, and the lettering inverted. Six, or two threes, of these now stand over the two entrance doors of Christ Church Library. There is good pressed-work on several ceilings in Oxford, as at No. 3, Brewer Street, now a carpenter's shop; Bishop King's house, St. Aldates; at Alban Hall, in a room over its former gateway; and at Corpus Christi College, in a similar position. The examples of imitative coin-work, and imitative timber-work, in Oxford are not numerous, but No. 23, Pembroke Street, with its coin-work, also supplies the sole remaining example of a window once tolerably common in Oxford, and locally called a "winged" one. They have special advantages, and are picturesque. All the specimens noticed run from 1611 to about 1650; perhaps a spurt given to exterior decoration of houses by the Royal visit of James I. They seem worth recording as a serious endeavour of the seventeenth century to decorate surfaces we now leave in bare ugliness, or line-out stiffly to imitate ashlar-work.

UNDER the auspices of the Corporation of London, an exhibition of pictures by painters of the British school who have flourished during Her Majesty's reign was opened, on the 6th inst., in the Art Galleries of the Guildhall. It affords a fairly complete view of the progress of painting during the Victorian era. The Queen herself lends Lady Butler's "Roll Call," Frith's "Ramsgate Sands," and Sir David Wilkie's "Penny Wedding," three pictures which in themselves cover a period of half a century. The Prince of Wales contributes Edward Hughes's portrait of the Princess of Wales. The Corporations of Birmingham, Leeds, Liverpool, and Manchester send some of their choicest treasures; the Mess Committee of the Royal Artillery lend Oulless's portrait of Lord Roberts, and the Sussex County Council Frank Holl's of the Earl of Chichester. Many of the most popular pictures in England are to be seen on the walls of the gallery: Millais' "Chill October," "Ferdinand and Ariel," and "The Huguenot"; Rossetti's "The Beloved," Watts's "Aurora," Poynter's "Faithful unto Death," and "Dragon of Wantley"; Long's "Babylonian Marriage Market," Seymour Lucas's "Intercepted Despatches," Burne Jones's "Bath of Venus," Alma Tadema's

"Women of Amphissa," Leighton's "Cymon and Iphigeneia," Orchardson's "Young Duke," Fred Walker's "Old Gate," and others familiar to this generation as household words. Mr. Luke Fildes is represented by his portrait of Miss Ethel Ismay, Mr. Wyllie by "Bawdsey Ferry" and "Black Diamonds," Mr. Sargent by the portrait of Mrs. Hugh Hammersley, and Mr. Boughton by "Snow in Spring."

Few things have so strikingly advanced in commercial value in recent years as engravings of the Early English school printed in colours. A collection of such has been dispersed at Sotheby's during the past few days. Some very high prices were realised. The most remarkable lot in the sale, however, was an ordinary impression of Walker's engraving of George Romney's portrait of Mrs. Musters, in the finest possible condition, with large margin, which realised what is probably a record price, namely, £180. Condé's engraving of R. Cosway's portrait of Mrs. Fitzherbert, in colours, sold for £74; and J. E. Smith's rendering of his own picture, known as "What You Will," very finely printed in colours, £75; "Thoughts on Matrimony," after J. R. Smith, by W. Ward, in colours, a very fine example, £41; "Louisa," drawn and engraved by W. Ward, in colours, £41; a moderately good example of Bartolozzi's engraving of Sir T. Lawrence's celebrated portrait of Miss Farren, in colours, £27; and "The Fortune Teller," by Sherwin, after Sir Joshua Reynolds, in colours, £20.

THE irrepressible Kaiser has just been guilty of yet another pictorial indiscretion. Upon a plinth in the middle distance is displayed a medallion portrait of the grand old Emperor William I. To the left of the foreground stands the usual mailed figure, representing, of course, the illustrious Designer himself. The right hand grasps a sword with downturned point, whilst the other waves a laurel-branch over the venerable warrior's head. Germania becomingly kneels on the opposite side, and offers, upon a cushion, what looks very much like a set of spirit decanters in an elegant case, though the object may be intended for a mediæval crown. Below are scattered wreaths, banners, and other suitable properties, and nine very fine and large sun-rays swoop down from above without illuminating certain dim outlines in the background which may be trees or demons. On the lower margin appears the signature "Wilhelm, R.I.," beneath the words "To the memory of William the Great."

A CURIOUS find has been made at a London bric-à-brac shop of a famous bust of Mrs. Harriet Beecher Stowe, the author of "Uncle Tom's Cabin." Dr. Wallace Wood, who occupies the chair of History of Art in the New York University, when in London recently, called at the shop of a dealer in Art pictures, &c., and asked if the dealer had any heads—heads exemplifying perfect types of intellect and culture. Two days later the dealer sent for Dr. Wood, telling him he had the bust of a countrywoman of his that had been sent to the exhibition of 1857. When it was sent to his apartments the doctor was greatly surprised and pleased to recognise it as a bust of Mrs. Stowe. The doctor wrote to Mrs. Stowe's daughter, Miss H. B. Stowe, of Hartford, who explained that the bust was executed by Miss Susan Durant, an American student in Paris, in November, 1856.

NEW YORK is about to see "Homes for Women who Work" erected on an enormous scale. A series of five blocks of buildings are about to be erected and adapted to the requirements of women who earn their own living. The first four of this series, the Business Women's Home, the Women's Hotel, the Art Students' Home, and the Model Tenement, are completed. The Architects are Miss Mary Gannon and Miss Alice Hands, and it is said to be the greatest Architectural work ever undertaken by women. These "Homes" are to be fitted with every conceivable convenience, and are arranged in groups of six rooms, having a bathroom, &c.,

to each group, although the rooms are let singly.

A NUMBER of interesting decorative objects, the property of the late president of the Royal Academy, will be offered for sale next month. They include a magnificent Architectural cabinet with silver figures, formerly in the possession of King Charles I., and introduced in the picture of "The Princess Elizabeth in the Tower;" also two carved chairs, formerly the property of the Chinese giant Chang.

A CORRESPONDENT, calling attention to the present state of London Bridge, says:—"The roadway has now been for some five or six weeks in the hands of paving contractors, who, apparently, are doing their work in a most desultory fashion. Instead of taking up one side and doing it thoroughly it is being done in patches over and over again, with the result that the traffic is always blocked. When the Tower Bridge was finished we believed that the traffic would be always clear, but at the present moment it seems to be nobody's business to look after the work, and business men whose residences are on the Brighton line have to lose their trains in consequence."

An important sale of pictures by old masters, chiefly Dutch and Flemish, but including some good Italian and Early English works, took place recently at Messrs. Robinson and Fisher's rooms, King Street, St. James's. To a large proportion of the many buyers and amateurs present the interest centred in an exceptionally fine example of the forcible Art of Franz Hals, a half-length portrait of a man in black with a white ruff and black hat, dated 1679, and measuring 2ft. 10in. by 2ft. 2½in. After a starting bid of 1000 guineas, it fell to Messrs. Agnew at 3350 guineas. So seldom do pictures by Franz Hals come into the market, that there are scarcely two dozen on record as having been sold by auction in this country, and no other has nearly approached such a figure. Seven years ago a portrait of a man reached 1900 guineas; and, in the same season, a painting of the Artist's wife brought 1750 guineas.

THE preliminary steps for securing a site for the new War Office have now been agreed to by the House of Commons. The site selected is the piece of land almost opposite to the Horse Guards which for many years has been lying derelict. It is certainly large enough, when cleared of the remaining buildings, to afford ground space for a magnificent block of offices. That their erection will be a striking improvement to Whitehall may safely be assumed, and it is also indisputable that the War Department is badly in need of new offices.

SOME details of the scheme known as the City and West End Railway, for the construction of an underground line, six miles in length, running between Cannon Street and Hammersmith Broadway, to be worked by electricity, recently came before a Select Committee of the House of Commons. The route will pass, by way of Kensington High Street, Knightsbridge, Piccadilly, Strand, and Ludgate Circus, to Cannon Street. The only question the Committee has to consider is whether the present scheme should be sanctioned, or a rival plan, or both. The proposed City line will have fourteen stations, and a two-and-a-half minute service of trains is to be organised, the journey occupying twenty-six minutes. The generating station and works will be situated on an admirable site, eighteen acres in extent, on the river bank at Hammersmith. A capital of £3,150,000 is proposed, with borrowing powers of £1,050,000, the cost per mile working out a little more than in the case of the Central London, which was explained by the fact that the station sites were a little more costly. The estimates amount to £2,880,000. Sir Benjamin Baker, engineer to the line, was called, and said he did not anticipate any difficulty in the construction from an engineering point of view, nor would there be any vibration or danger to property in the working.

An interesting find was made a few days ago at the Grey Friars Monastery, Cardiff, the ruins of which are being excavated, under the direction of Mr. C. B. Fowler, Architect. At the north-west corner of the Church of the monastery, outside, but close to the north wall, there was found about 4ft. beneath the surface some 200 pieces of original fourteenth-century glass, which no doubt formed one of the windows of the Church, and was hidden or thrown in a heap at this spot when the Church was demolished. All the pieces have been carefully taken out, and Mr. Fowler has promised to let us have a drawing of them for reproduction in these columns shortly. The designs illustrated comprise the foliage of the oak, ivy, sycamore, and acanthus, with pretty borders of other leaves, and birds—the dove and the eagle. This find is much more interesting, and the pieces in a better state of preservation, than was the case with the glass unearthed at the Black Friars, for the latter appeared to have been subjected to the action of fire, and easily crumbled.

As the Egyptians, Etruscans, and Greeks were artistic, so, it seems, are the Abyssinians. A great organ has been ordered from Berlin for the Cathedral of Adis Abeba, the residence of the Emperor Menelik, and a celebrated Russian painter, Vladiscow, is going there to paint the Negus as he appeared at the battle of Adowa. The Cathedral of Adis Abeba is composed of two Churches, one inside the other. The outside one is open to all the faithful, while the inner is reserved for the sacred persons of the Negus and his family. The Emperor Menelik, it seems, has an artistic fancy. He wished the outer walls of the inner Church to be decorated with religious pictures, and ordered, under the first Crispi Cabinet, the pictures in Italy, sending the measures of the walls and the windows which break them.

THE offices of the Prudential Assurance Company form a striking feature of the street Architecture of nearly all the towns of England. One firm of Architects has designed the whole of this company's buildings, Messrs. Alfred Waterhouse, R.A., and Son. New buildings which have just been completed at Sheffield occupy a fine corner site in Pinstone Street, adjoining St. Paul's Churchyard, and the style, externally, may be described as a free treatment of Renaissance Architecture. The lower stage of the external elevation consists of a colonnade of pilasters surmounted by an entablature which runs the whole length of the façade. The gables are on a curved outline, flanked by hexagon finials rising from hexagon ribs, which divide the top story of the front into several bays or compartments. The frontage, which is five stories in height, is composed of Edwards's red bricks and red Ruabon terracotta. There are two entrances, that on the left, leading into the Prudential Company's offices. The somewhat peculiar shape of the ground presented difficulties, but at the same time it led to the adoption of an arrangement of plan in which corridors were entirely absent. All the sets of rooms on the upper floors open directly off the staircase landing, and the passenger lift communicates with the same landing on every floor. The general contractors are Messrs. George Longden and Son, to whom the principal share of the work has been entrusted. The other sub-contractors are: Plumbing and glazing, J. B. Corrie and Co., Sheffield; sanitary fittings, &c., Morris and Ingram, Manchester; steel work in floors, Handysides, Derby; cement stairs, A. Walker, Leeds; ceramic mosaic floors, Craven, Dunnill, and Co.; ornamental ironwork, Hart, Son, and Peard, London; electric lighting, Belshaw and Co., London; tiling and slating roofs, Proctor, Sheffield; heating, Ashwell & Nesbit, Leicester; gunmetal casements, Critall and Co., Braintree; ranges, hot plates, and Marlbro' grates, Steel and Garland, Sheffield; ornamental ceilings and wood mantelpieces, Shuffrey and Co., London; locks and furniture, James Gibbons, Wolverhampton; headlights, J. V. Rowland and Co., Liverpool; plastering, Hodkin and Jones, Sheffield. The hardwood joinery has all been carried out by the general contractors. The cost of the building and land is £25,000.

LONDON CHURCH ARCHITECTURE  
OF THE VICTORIAN ERA.\*

(Continued from page 126.)

By T. FRANCIS BUMPUS.

Author of "London Churches Ancient and Modern,"  
"Ecclesiological Notes from North Germany," &c.

STANDING in the plot of ground enclosing the Church of St. Peter, Vauxhall, on the north, and looking up at its semi-circular apse of brick, pierced with single lancets high up in the wall, and capped with its fleuriated iron cross, we may imagine ourselves in Murano, and not in the prosaic dinginess of Lambeth. Raised at a time when the foreign Gothic mania was at its height, St. Peter's, Vauxhall, presents three grand characteristics, all thrown in by Mr. Pearson with great cleverness, i.e., the equal height of the nave and chancel; the consistent roofing of the entire building with stone-ribbed groins of brick, the adoption of plain lancet, or two-light plate-traceried windows, with huge foliated circles; and the introduction of a blank story between the arcade and clerestory, destined for simple pictorial enrichment. On entering St. Peter's, Vauxhall, we are arrested by an impressiveness which few London Churches of its date succeeded in producing; from the western door to the altar the view is unbroken, and the eye is charmed with the fine vista terminating in the groined apse; based, I cannot help thinking, upon that in the Church of Notre Dame at Dijon. Here the triumph of the Architect's skill is perceptible. The clerestory is lighted by tall lancets filled with rich stained glass by Lavers and Barraud; but in which the figures are somewhat attenuated. Immediately below them is a low open arcade of very Lombardic character, through which the triforium windows peer very felicitously; then under these we have a series of fresco paintings, so arranged that the Crucifixion occurs immediately above the reredos. It is, however, a matter of much congratulation that the rage for exact reproduction of Continental Architectural detail has passed away. The wholesale importation of features unsuited to our climate, and the apparent disregard shown for our own beautiful examples, were much to be regretted. Still, while the style of Church put up, suitable for the requirements of our ritual, show in Architectural detail no tame copyism of Mediæval work, I am happy to say that *bizarries* are yearly becoming less common.

## OTHER LONDON CHURCHES OF 1860-70.

Before saying a few words on the Churches built in London since the return of Architects to more strictly English forms, it may be interesting to give you the names of a few Churches erected between 1860 and 1870, of more than ordinary interest. Conspicuous among these are White's noble Church of All Saints, Notting Hill, finished after long delay in 1861; and his small but very clever brick one of St. Saviour, Highbury, completed in 1866. With the latter may be classed a group of Churches, erected from Mr. White's designs, in the parish of Battersea, and of which St. Mark's, close to Wandsworth Common, may be taken as an excellent example. The skilful manner in which much of the detail is executed in brick is very noticeable, and praise must be awarded, not only to the carving of the pier capitals in a variety of carefully-studied foliage and flowers, but to the air of dignity with which the Architect has contrived to invest his interior by the elevation of his chancel upon a crypt. St. Mary-by-the-Park, another of this Battersea group, is a strikingly abnormal design, presenting many of the same features, but its unfinished state precludes it from competing with the example I have just quoted. Scott's Churches of St. Clement, Barnsbury (red and yellow brick), and St. Stephen, Lewisham (stone), are stately experiments in an English and French type of First Pointed respectively from his

able hands; St. Jude, Gray's Inn Road; St. Stephen, South Kensington, and the cognominal Church on the Green at Hampstead, by Peacock and Teulon, are, although eccentric, not without their effective points; while St. Peter's, London Docks; St. Luke's, Stepney; St. Luke's, Kentish Town; St. Michael's, Paddington, and St. Peter's, Windmill Street, exhibit the proclivities of their various Architects in the direction of coloured material, as well as in a preference for non-English forms.

## BURGES' ONLY LONDON CHURCH.

There is, however, one London Church—probably the most striking and abnormal that this phase of the Gothic revival has yet seen—which I must, for a few moments, dwell upon more fully. It is that of St. Faith, Stoke Newington, partly finished in 1873, and completed by another hand ten years later. Its Architect—William Burges—was, perhaps, one of the greatest geniuses that the century has produced. His works are not numerous,\* but they are all marked by great individuality, originality, and character. He regarded Architecture, in a great measure, as a vehicle for painting and sculpture, and for a particular period of it—the Early Thirteenth Century Style of France—he had a predilection. However commonplace the building might be upon which he had to work—as, for instance, St. Thomas' Church, Clapton, a hideous brick conventicle of the last century, which he was called upon to remodel in 1874—he invariably sought to introduce something artistic into it. In his tastes, Burges was ultra-Mediæval, and when he was commissioned by the Dean and Chapter of St. Paul's to prepare designs for the entire decoration of the Cathedral, it is not to be wondered that he should have produced designs which had immediately to be set aside on account of their incongruity with Wren's masterpiece, magnificent and thoughtful as they were. Pecuniary considerations interfered with the carrying out of Burges' plans for St. Faith, Stoke Newington, to their fullest extent, and although the Church has, within the last ten years, been extended and a west front built to it from the designs of an Artist whose sympathies with the Early French Gothic are the same as Burges', the interior lamentably fails in effect from the infelicity of its fittings and decoration. The Church embraces a nave and chancel of enormous height, terminating in an apse of noble sweep and all contained under one line of roof. There are no lofty pillars or wide aisles. In lieu thereof we find an enormously broad nave, out of which open very narrow passages or vomitoria formed in the thickness of the wall; above these is a continuous row of broad lancet windows, like those we see in the eastern part of the choir at Canterbury Cathedral, and in the eastern parts of Sens and Auxerre. The whole is covered by a very simple wooden coved roof, and a grand wheel-window lights the west front, which is flanked by severe pinnacled turrets. While the idea of the Church is original, there can be no doubt its Designer was influenced by some of those great speluncar Churches in the south-west of France. Clutton, Burges' former partner, had built a similarly-planned Church in 1847 at Bethnal Green,† but there the idea seems more Rhenish. Street's magnificent work—St. Mary Magdalene, Paddington, an admirable instance of how an Architect need never fear to obey that hard word "must"—I mean in the matter of an awkward site—belongs also to this period (1868-1878), as does a pleasing little red-brick Church—edited in a Northern French style—St. Mary Virgin, Primrose Hill.

## LATER WORKS OF PEARSON AND STREET.

Of the English styles resuscitated in the Churches built since the commencement of the "seventies" round London, we have peculiarly noticeable examples in those

\* St. Finbar's Cathedral, Cork; Studley Royal Church, near Ripon; Brisbane Cathedral; decoration of Worcester College Chapel, Oxford; Cardiff Castle, and the remodelling of St. Thomas', Upper Clapton, are among the most important.

† St. Jude's, one of Bishop Blomfield's ten Bethnal Green Churches, built between 1840-1849.

magnificent contributions to ecclesiology from the hand of Mr. Pearson—St. Augustine, Kilburn; St. John, Red Lion Square; and St. John, Upper Norwood—Churches in which the sublime in Architecture has been reached. With them we may class the fine Church by the late lamented Mr. Causton, of St. Philip, Stepney, presenting, as it does, several features in common with Pearson's work. As a type we will take St. John's, Red Lion Square, whose interior is, looking eastward, one of the most truly picturesque in London. The charming "views across" forced upon the visitor from almost every part of its interior have, however, been dictated, not by the promptings of fancy, but by exigencies of site. This was a square plot of ground, bounded north and west, and partially south, by houses. Mr. Pearson was thus driven to adopt an unusually wide nave, having two narrow aisles on either side of it, and opening into a choir, very much narrower, but of the same height. The junction of the broad nave and narrow choir was effected, in this instance, not by the canted bay—a very beautiful feature used in several instances by Mr. Street\* for connecting a wide nave with a chancel of much more contracted dimensions—but by an arch opening into the aisle on either side the great central one, all in the same line. Mr. Pearson's *motif* for this treatment appears to have been the Cathedral of Gerona, in Spain, where the same enormously broad nave and narrow choir is found. At the south-east corner of the site was an irregularly-shaped piece of ground; this suggested the erection of an apsidal chapel and gabled transept, with its south wall sloping away to meet a tower forming the porch. Throughout the Church the detail is of the most delicate description, recalling much of that in the Yorkshire Minsters. Like many another fine London Church built since the Revival, St. John's, Red Lion Square, left the hands of its Architect very inadequately fitted with the *instrumenta* of Divine Worship—inadequately, that is to say, to its structural claims. These, individual munificence has gradually supplanted, and St. John's now stands forth in the possession of some of Clayton and Bell's finest glass—that in the eastern quintuplet of lancets, arranged, like Worcester, in a double tier, being of special beauty; chancel-screen; pulpit; choir stalls; trytick reredos; font, and, in short, all the furniture requisite for a Church of this last decade of the nineteenth century, on a scale commensurate with the fabric. The feature *par excellence* of all these Churches of Mr. Pearson is their continuous brick vaulting. St. Philip's, Stepney, is similarly vaulted. While St. Mary Magdalene, Paddington, was in progress, Mr. Street had accepted the commission to erect another Church, equally sumptuous, in Kennington, i.e., the well-known Church of St. John the Divine, which presents us with a specimen of pure Early Decorated work, all the more interesting since it marks the return of Mr. Street to strictly English forms after his experiment in North Italian at St. James-the-Less, Westminster. Time forbids me to enter into a detailed account of this lovely building, but I may just mention that the absence of clerestory and the employment of tall arcades on slender clusters of shafts was doubtless suggested to Mr. Street by Bristol Cathedral, whose nave he was engaged upon building contemporaneously.

REVIVAL OF LATE DECORATED AND  
PERPENDICULAR.

It is a matter of great congratulation that the poor, once-despised Perpendicular has again found favour, several of the grandest and most striking Churches reared in London of late years having been worked either in that style or in that of its immediate predecessor, the Late Decorated. Splendid examples of the latter exist in Mr. G. G. Scott's All Hallows, Southwark, and St. Agnes, Kennington; Messrs. Bodley and Garner have employed it in their recently completed St. Michael's, Camden Town, and St. Mary-of-

\* Notably St. Saviour's, Eastbourne, and St. John's, Kennington.

\* A paper recently read before the Toynbee Architectural Society.

Eton, Hackney Wick; while St. Barnabas, Dulwich, and the new Parish Church of Hornsey, founded on the model of some of those magnificent Churches bordering on the Wash—such as the Wiggenshalls, Terrington, and Walpole St. Peter's—afford highly pleasing examples of revived Perpendicular. It seems strange that this glorious fifteenth century style should have been so long forgotten. The "Cambridge Camden" Society discouraged its adoption whenever it could; for some it was too horizontal, for others too perpendicular. The Dry-as-Dust stigmatised it as Modern; the Sanctimonious thought it too Secular; Ruskin hated it, in fact almost everybody until within the last twenty years had an ill word for it, except Pugin, Freeman, and Fergusson. For present day town Churches no style is better adapted than the Early Perpendicular, with its light, graceful arcades and its great windows. An age which produced such glories as the towers of Canterbury, Gloucester, Wington, Bishops Lydiard, and St. Cuthbert's, Wells; such naves as Canterbury and Winchester, such a choir as York, such roofs and bench-ends as exist in East and West Anglia, is surely entitled to respect from the most ardent purist. It is a style peculiarly English.

#### SOME RECENT CONTRIBUTIONS TO LONDON ECCLESIOLOGY.

Although there are many Churches erected in London of late years to which I should like to direct your attention for a brief space this evening, such as St. Cuthbert's, Earl's Court; St. John Baptist, Kensington; All Saints, Dulwich; Holy Trinity, Sloane Street; St. Dominic's, Haverstock Hill; and St. James', Spanish Place; to say nothing of another and most interesting and important branch of my subject—the restoration of old Churches and remodelling of debased and inferior ones—I fear I must here leave you. It is, unfortunately, far too common with people nowadays to dismiss a modern Church with a sort of contempt, as hardly worthy of notice, but if such folks give some thought as to the "how" and the "why" of the existence of such Churches, I am sure these buildings will be found to present as interesting a history as those of the Mediæval periods. Let us of the present generation, then, be truly grateful to those who bore the burden and heat of the day in giving us such noble creations at St. Matthias', Stoke Newington, St. Giles', Camberwell, St. Mary Magdalene's, Munster Square, St. Alban's, Holborn, and the North-East London group, whose salient features I have endeavoured to interest you in, and to familiarise you with.

A SHOP in Botcher Gate, Carlisle, has collapsed, owing to building operations on an adjoining site.

A TELEGRAM from Cherbourg states that important works are about to be undertaken on the Ile Pelie, with a view to strengthening the defences of that port. The cost is estimated at 1,100,000fr.

THE largest oak wine vat in the world is being erected in a San Francisco cellar. When finished it will have the proportions of a two-story cottage.

THE new Post-office erected in Bishop Street, Rothesay, has been opened by the Marquis of Bute. The new building, which has been erected at a cost of about £4600, is in the Classic style of Architecture.

THE discovery is reported, by workmen engaged in excavations for the exhibition building at Brussels, of a sarcophagus containing the remains of Attila, the celebrated chief of the Huns, whose final resting-place has been a mystery.

THE British Astronomical Association has accepted the offer of the Royal Botanical Society of a site in Regent's Park for the purpose of erecting a new observatory. The position is a particularly favourable one, as it possesses a very fair horizon, and is easily accessible from all parts of London. The Association will now have to consider the important question of funds for the erection of the observatory.

#### THE ARCHITECTURAL ASSOCIATION.

##### DISCUSSION ON MR. T. G. JACKSON'S PAPER.

(Continued from page 124.)

MR. OWEN FLEMING was the first speaker. He proposed a vote of thanks to Mr. Jackson for his most thoughtful investigation of the problems that face modern Architects anxious to possess that spirit which they all so much admired in Architects of days long passed, and the absence of which in the Architects of the present day they so much deplored. They fully realised the difficulties standing in the way of a return to the idyllic picture of Mediæval times which Mr. Jackson had sketched out, yet there were some Architects who had forsaken the present-day conventionalities of their Art in favour of a nearer approach to the methods of a few hundred years ago. He knew a student who had given up excellent opportunities in order that he might become articled to a mason, and, as a mason, take up his stand on the scaffold; and the speaker ventured to think that that student's work would very appreciably benefit by the course he had adopted. But, in seeking to move on a wider scale, there were certain modern conditions which they could not possibly forget, and the impossibility of obtaining a reasonably accurate estimate of the cost of a building constantly altered during course of construction was not the least obstacle which was in the way of a return to past methods. At the same time there were things they could do, and it was not a little interesting in this connection to note the effort which had been made during the past eight or nine years to introduce more of the practical side into the Architect's work. The efforts had been based on the belief that a purely academical form of education was likely to injure rather than improve the Architect and his works, and among the supporters of this theory were numbered Mr. Jackson, Mr. Lethaby, Mr. Voysey—in fact nearly all those who were earnestly desirous of carrying forward a practical scheme of education. Last year at the School of Design in Handicraft a new system was begun. Instead of trying in a scrappy way to sketch out various buildings month after month, it was resolved to take one building and work it out thoroughly. This year the system had been developed, and although the work of the class had not yet been seen, he was sure that when it was exhibited, as it certainly would be during the next two or three months, one would feel encouraged and led to believe that they were pursuing—he would not say the right road, but a road which led them in the way they wished to go more directly than any other road. They had deliberately put on one side the reproduction of past forms, and had settled down to study the material, and to get at its real nature and possibilities. When they had learned these things, their drawings would simply be diagrams illustrating as far as possible how they thought these materials ought to be treated. He thought the Architectural Association was arriving at one of the most critical periods of its existence. There was going to be a struggle between the academical way of treating Architecture and the practical. They did not object to the Institute examinations; he had undergone the examinations, and spent years in preparation, which he had since come to look upon, in a measure, as waste of time. What he suggested to students was that, as the examinations had to be got through, they should not spend more time in preparation than would just qualify them; they were to just pass and then devote their time to what he called real Architecture—real building. And the way they were going to do it was by a close and harmonious working with the Arts and Crafts School. Mr. Lethaby had told him that to obtain, it was but necessary to ask the Technical Board for a series of good workshops to be placed at their disposal, and he ventured to hope that these workshops would be incorporated in their new premises, for it seemed

very essential to him that they should have their workshops on the premises.—Mr. Hampden W. Pratt, in seconding the vote of thanks, said they had been more and more led to believe that the Architect's education was incomplete unless it embraced considerable knowledge of all the handicrafts with which he had to do, and, although Mr. Jackson would have Architects handle as many trades as possible, yet if pressed he would, the speaker believed, admit that to possess a thorough knowledge of one handicraft was better than a smattering of many. There was, no doubt, a tendency—and technical schools seemed to exhibit it—to have a smattering of many trades, and to go about their work in an amateurish way. He would be sorry if technical education was taken up to a great extent on these lines. If an Architect, however, were to take up masonry or carpentry, and confine himself to one or other of these trades, he would, no doubt, be able to fulfil the conditions expected of him, and derive many advantages from his practical knowledge. Undoubtedly there were many interesting trades to which he might put his hand, but, unless they were to get two years into one, it seemed impossible to attempt anything of that sort. One trade might be studied with very beneficial results, but to attempt more would, he thought, be harmful. He thought the Association was moving in the right direction in bringing a modelling class into such prominence; it was the best class they had, and he recommended it heartily to the students. To set up workshops for carpentry, masonry, and so on, for the use of Architectural students, would appeal to them as an ideal course to pursue, no doubt, but the practicability of carrying it out was perhaps quite beyond their reach. It was satisfactory to see that the sympathies of the Association were in that direction, and, whether it established such shops or afforded facilities for students to go elsewhere, there was not a man present, he thought, but would indorse what Mr. Jackson had said in favour of the Architect working more intimately with the Craftsman. One thing he thought the Association might extend, and that was visits to workshops. Next to working in workshops, the best thing was to visit them. Proceeding, Mr. Pratt agreed with the necessity of making working drawings, but of course there were certain details which could be chalked out on a board just as well as set down on paper. Mr. Jackson had set them thinking, and the question was, "How far can we go towards realising the ideal which he has set forth?" He had brought that ideal within reasonable limits; if he had insisted on labours which meant ten years in the workshop they might have been frightened, but he had put the question before them in a common-sense way, which he felt sure would have the effect of bringing about a greater union between Architecture and the allied trades.—Mr. C. H. Brodie thought there was a middle course to be pursued in this matter—and that was to go out on the buildings with the Clerk of the Works and thus see the work carried through from excavations to the finish. He thought no Architect was really an Architect until he had done that. Taking engineers as a body, they knew vastly more about their work than Architects did about their Art, and this, he maintained, was the result of the members of the former class being bound to spend certain time on works in progress. Until such a system was adopted in connection with Architecture, the members of the Profession would go on blindly—blind men leading blind men. Of course, if they took up some handicraft, so much the better, but, above all, it was essential that they should see a building carried through from start to finish.—Mr. Banister F. Fletcher thought Mediæval methods of Architecture impossible in the present day, but Mr. Jackson's remarks as to knowledge of materials must find general favour, for they could not properly design unless they knew what qualities the material in which the design was to be carried out possessed. The question was, "How are you going to get that knowledge?" And then, as to the relation of the Architecture to the Crafts, he was rather inclined to believe

that no evidence had been shown that it was necessary for an Architect to work in any trade. When they were called upon for a design, they could go to the workshop and see the process of manufacture; if they had not got the ability to note the qualities which the material possessed—well, he was afraid they would not acquire the knowledge by hammering away at a bench. In considering this phase of the question, it was well to see what had been done in the past. What did the Architects of two hundred years ago do? Did Wren, Pugin, Scott, or Street ever go hammering at the bench? They had no evidence of such a thing, and he thought such a training unnecessary. Proceeding, Mr. Fletcher maintained that past forms were as essential to the Architecture of to-day as the English language of two hundred years ago was to the English of the present time. And as to the question of Academic v. Practical—well, he had many apprehensions as to the practical man, for he had never met one who was really much good. They should not be unmindful of the clients' point of view. And they could not get rid of the fact that in the nineteenth century the Architect was very largely a business man, and when approached by a client was expected to protect that client from the builder, and anyone else who might seek an advantage.—Mr. E. W. Allfrey, one of Mr. Jackson's pupils, was the next speaker. How far, he asked, was an Architect to go in his knowledge of a complicated modern building with sculptured decorations, &c? Either the Architect must make the designs himself or leave them to his workmen. If he was to do the designs himself, then he must have great knowledge of many branches. But it seemed to him that the Architect should possess general knowledge, and be able to see where his workmen were at fault in order to put them right. He did not think it was necessary for him to go very far into the craftsman side of the work.—The Chairman (Mr. W. H. Seth-Smith), in concluding the discussion, said, from whatever point of view this educational question was discussed, they felt they could all claim the same motive—the progress of the Art of Architecture. He was sure Mr. Jackson's paper would contribute to that end because, as Mr. Pratt had said, it was so moderate and so eminently practicable in its suggestions. The contrast the author of the paper had drawn between the Greek and the Roman Schools was very interesting, and he gathered from his paper that he differed from both—that he would adopt the medium course, and would have them become more of sculptors than they were, and have them follow more fully the general training which the Sculptor-Architects of Italy enjoyed. He had personally found it a great advantage, when dealing with carving, to go into the sculptor's studio and to handle the clay himself; at such times his only regret was that he was not more skilled in the Art. He did not understand Mr. Fleming in his forecast of the struggle which the Association was to undergo. He saw no signs of any such struggle, because the movement was becoming more and more practicable, and the Association was entering more and more into it. Although Mr. Jackson thought they ought to devote more time to the study of the allied trades, he (the speaker) thought it would be best to draw a moderate course now, and then feel their way. It was quite impracticable to spend a year in the joiner's shop—and they could not learn how to properly handle the tools in less than a year. Personally he preferred modelling to carpentry, for if they were good modellers a great deal else followed naturally. Every young Architect who had the chance would do well in his first work to go and reside on the spot, and conduct the building from start to finish; or, if he could not do that, to obtain an engagement as Clerk of the Works.—The vote of thanks was carried, and, in replying, Mr. Jackson said he had always looked upon the Architectural Association as one of the most hopeful organisations for the advancement of Architecture, and with its studio and the School for Arts and Crafts it was carrying out what he thought was the training of Architects on the best possible

lines. As to the examinations, if the proper way was to get rid of them as lightly as possible, why have the examinations at all? Mr. Pratt had referred to the danger of dabbling in many crafts; but, whilst he (Mr. Jackson) admitted that it was better for an Architect to make himself master of one craft, he did not see any great objection to his dabbling in a great many, for he did not think that in their case "a little knowledge was a dangerous thing." He agreed that it was very desirable that a student should go on buildings either as Clerk of the Works or under a Clerk of the Works. He always recommended his students to adopt this course, for they saw all the crafts at work, and thereby obtained knowledge which they would never acquire in the office.

### THE PRINCIPLES OF PERSPECTIVE AS APPLIED TO ARCHITECTURE.\*

By E. BRADBURY.

IT is hardly necessary for me to explain what is meant by "Perspective"; it is one of the most familiar words to an Architect in his every-day experience, and if not practically used in connection with Design, at all events is perfectly understood by him as indicating the appearance which a building or an object will actually present when it has reached a later stage of its existence than merely being upon paper in the flat. It is, in fact, the representation of the "round" on paper, and as such is mostly used by Architects to give an idea of the appearance of a building before it has actually been erected, such a perspective being, of course, obtained by means of the application of certain rules in the concentration of two or three geometrical drawings, no one of which will give the appearance of the building or object into one drawing which will take in all particulars of a building—plan, elevations, and details. The value of a knowledge, however slight, of the Art of Perspective, it will be evident, is very great to anyone engaged in the Architectural profession. To the student, it is invaluable in enabling him the more readily to sketch an existent building, for then he will understand why certain vanishing lines should take the peculiar direction on his sketching block which is without this knowledge somewhat inexplicable to him. He will, having this knowledge, understand why a line which he knows is perfectly horizontal should take an oblique direction across his paper, and why distances which he knows are exactly similar, should be apparently so different in length when viewed from a near or a distant standpoint. To the Architect in practice the knowledge of perspective is also of immense assistance. A rough little sketch of a house as he has built it in his mind's eye, and which is submitted to his client, will be more telling and more readily understood than the usual form of elevations, however artistically finished and shaded. An Architect can understand and grasp the meaning of the geometrical drawings of a building without any trouble, but to a man who is unused to such things, and who is probably building his first house, they are often almost as meaningless as a Chinese puzzle, and the little sketch in the corner of the sheet will be resorted to by him with great gratitude, as a solution to the meaningless lines (to him) of ridges and hips, and so forth, which he is unable to patch together in their proper position. How useful this knowledge of perspective is you may have gathered from the remarks made by Mr. Drew and Mr. O'Callaghan in their lectures to this Association. You will remember Mr. O'Callaghan's remarks about the appearance of an archivist resting upon a column strong and large enough to carry twice the weight it had upon it; what looks correct when drawn geometrically in front and side elevation may not necessarily be correct when viewed diagonally, and in any building the view which is obtained of any feature is most frequently a diagonal one.

\* A paper read at the Architectural Association of Ireland.

And this is where the value of the Art asserts itself, for even if the Designer knows only the

#### PRINCIPLES OF PERSPECTIVE,

he can tell how an object will appear when viewed from any position, and thus save himself from error. To the Architectural assistant the whole of the reasons stated for the study of perspective apply with even more force, for, as a student, he will find it of use to himself, and, as an assistant, his usefulness will be largely increased by such knowledge. No Architect need be without this knowledge, for the rules of perspective drawing are few and simple. I need hardly say that I do not propose to give you accurate instructions in the Art, so that you can immediately sit down and work up a perspective drawing of your latest design. There are two methods by which a perspective representation of a building may be obtained, which are equally correct, and which, I believe, have about an equal number of adherents. One of these, and the oldest, is that which is generally known as the plan method, and the later process involves the use of vanishing and measuring points, but does away with the awkward plan. In the use of the first method, if you wish to make a perspective view of a building which is at all large, it is necessary to clear the office of everyone but yourself, and to keep it hermetically sealed against intruders, because if the office boy gets in you may find your "eye" shifted, and not be able to get it into its socket again, and the drawing will be an utter failure; for by this plan method the eye is an essential feature throughout the whole process of setting up the perspective. But by the other method you only need an "eye" for a very short time, and after that may dispense with it. By the plan method it is also necessary to make a special drawing of the plan, both a tedious and wasteful trouble, which is avoided by the use of the measuring-point method, in which the ordinary drawings are quite sufficient. Personally, I have used both methods, but I have come to the conclusion that the measuring-point system is by far the least troublesome, and is more correct than the plan method, and I now never resort to the latter. Therefore, I propose to deal only with the system which I have adopted. In any method of perspective representation the same general rule is followed of "interception," if I may use the term. By this, I mean that a sheet of glass, or other transparent material, an imaginary sheet at all events, is supposed to be placed between the spectator and the object or building which is to be represented. By tracing upon this imaginary sheet the lines of the building, we obtain what is called a perspective drawing. This imaginary sheet is called the

#### PICTURE PLANE.

It must be distinctly understood that these two planes—the ground plane and the picture plane—are each indefinite in area; that the ground plane can, if necessary, extend all round as far as the horizon, and the picture plane as high as the clouds and as low as the lowest depths of the sea. You will see that the nearer the picture plane is to the object, the larger the perspective representation will be. Another general rule is that all lines which are parallel to one another will converge towards and vanish in the same point. Thus, if standing in the centre of a long straight street, you will notice how all the long horizontal lines—the pavements, the eaves of the buildings, window-sills, &c.—all appear to approach one another, and that, if continued, would meet in one distant point; the lines below the level of the eye seem to rise as they get farther from the spectator, and the lines above the eye-level to descend. And this introduces another rule, which is that all horizontal lines vanish in a point or points situated at the same level as the eye. The reason of this is that the line of the horizon is at the eyes' level; if you stand upon the sea-shore the surface of the sea appears to rise from you until it meets the clouds exactly at your eyes' level. It must be borne in mind that all horizontal lines will vanish in this line of horizon. Thus, as I have already said,

horizontal lines above the eye-level will descend in their perspective representation, and lines below will descend. I mention this the more particularly because I have noticed in very many perspectives that this most essential rule was evidently not known to the author of the drawing, and a sketch is very much injured by its non-observance. But now to get to the more practical part of the subject—the actual working out of a perspective drawing on paper. First you must settle on

#### THE SCALE

to which you intend to work; the most useful to use for any ordinary building, such as a villa, is 4ft. to an inch, as it is very convenient to have a scale which is a multiple of the scale to which the geometrical drawings are drawn, which is more often than not, 8ft. to an inch. Moreover, it can be reduced if it be necessary. It is just as well to appropriate the largest drawing-board and the longest T-square you can lay hands upon when you commence your preparations, also a good big sheet of paper. Pin it down about in the centre of the board, and pin it down very securely, too, as it must not be moved until the whole thing is finished. Then draw a horizontal line right across the paper, and extend it on the drawing-board if necessary; this line is the line of horizon, and along it will be your vanishing and measuring points. Then determine the height of the spectator, and set down from the line of horizon that height to scale, and draw another horizontal line. This will represent the ground line, where the picture plane meets the ground plane. Of course, it will be understood that the paper you draw upon represents the picture plane. The next thing to do is to obtain the position of the "eye." This point must be imagined as being swung down from its position opposite to the picture plane to a position upon the picture plane.

#### THE POSITION OF THE EYE

must, of course, be governed by the peculiar circumstances of each case. If it is a small building, 20ft. or 30ft. of a distance from the picture plane will be sufficient; but if it is a large or high building, the position of the eye must be moved proportionately further away. The point on the picture plane immediately opposite to the eye is called the point of sight, and in it vanish all lines which are at right angles to the picture plane. Oblique lines vanish to the right or left of this point, and the vanishing points for all lines are obtained by drawing lines from the eye parallel to such lines until they meet the picture plane, and these points of intersection will be the vanishing points for such lines. Thus, to obtain the vanishing point for a horizontal line, which is inclined to the picture plane at an angle of 45 degrees, you must draw a line from the eye at that angle until it meets the line of horizon. And the same with all other lines; if the building have a great number of gables, it is often useful to get the vanishing points for each side of the gables, but that is too advanced for everyday use, and is very seldom needed. Now to obtain

#### THE MEASURING POINTS

the rule is very simple: "With the vanishing point as centre, and to the eye as radius, describe an arc which will cut the line of horizon, and the point thus obtained will be the measuring point for all lines vanishing in that vanishing point." Measuring points are in reality vanishing points, and their purpose is to produce lines which will constitute the base of numerous isosceles triangles, one side of which is formed by the picture plane, the second by the line to be measured upon, and the base by the measuring line. The theory of the measuring point is rather complex, but the practical application of it is very simple. I do not purpose detailing here the further processes of setting up the drawing; it is merely by the application of the vanishing points and measuring points, and it must be only remembered that all measurements must be made upon the picture plane. Heights are obtained by using the vanishing points as measuring points, and I may say that any point on the

line of horizon may be used to measure heights, and you are not confined to the use of one point, as in measuring upon horizontal lines. It is very often difficult to place the vanishing points within reachable distance of a moderately long straight-edge, and numerous methods are used for dispensing with the actual points themselves. I will not enlarge upon the different methods, but I can decidedly say that if a vanishing point is within reasonable distance, hammer a pin into it and leave it there until you have finished the work. After obtaining the drawing in pencil comes the question of the finishing of it, and this must be left to the taste or talent of the Artist. It can either be finished in pencil, ink line, colour, or monochrome, or these combined. For a detail perspective, or for a drawing which is to be reproduced and printed, a black ink line drawing is the most suitable. By the use of Winsor and Newton's indelible brown ink, or Prout's brown, a most pleasing effect can be produced, but I have no doubt the majority of votes will go for colour; line drawings produce "Architectural" pictures, and colour drawings form "Artistic" pictures. One gives a drawing which is satisfactory from an Architect's point of view, the other a picture which pleases the Artist's eye. Probably, in nine cases out of ten, the best thing to do is to combine the two, but the consideration of such a point must be left to more competent minds than my own. One or two

#### GENERAL PRINCIPLES

may be mentioned which are worth remembering in making any sketch or perspective drawing, referring to the general treatment of the subject. First, as regards the view; never, under any circumstance, have both sides of a building vanishing to either side at the same angle; place yourself always in such a position that one side is seen more than another—if you do not, no matter how well the drawing is finished, it will appear "amateurish," and, to a certain extent, distorted. A very useful angle for the front or principal side of a building to vanish is 30 degrees with the picture plane. Also, except in certain cases (there are, of course, exceptions to every rule), do not place your spectator too close to the building—if you do so, you will get the details on the near portion of it very large, and the details farther away very small; the roofs will not show up to advantage either. In fact, there are numerous reasons why a building, to obtain its full and true effect, should be viewed from a fairly distant standpoint in preference to one close up to it. I admit that a very great number of perspectives taken from a close standpoint are extremely effective and nice, and that in some cases a view taken from such a position is more satisfactory than a distant view. But in the majority of instances it is better to view a building from a fairly distant point in order to obtain its full effect. But in this, as in all matters relating to the artistic considerations of a perspective drawing, no fixed rule can be given, and each sketch must be governed by its own peculiar conditions of design and locality. Then, again, as regards inking-in a perspective drawing, if you want a "picture" by all means make a picture, but do not try to make a picture and at the same time put in every detail of a building; the two things cannot be combined. If you want a "picture" do not use the pen; use only colour or monochrome, and call the production a picture. An Architectural perspective is a very different thing; lines are essential for a detail perspective, whilst very nice effects can be produced by the use of shades and shadows, either in line or tint. Another very useful thing, remember, is this, that shadows are darker than shades. Take, for instance, a porch projecting from a wall of the same material and shade. If a light is casting the shadow of the porch upon the wall, the shadow so cast will be darker than the shade on the side of the porch. Still another point worth remembering is that if a dark surface and a light surface are in juxtaposition, the dark surface will appear darker where it approaches the light surface, and (*vice versa*) the light surface will appear lighter where it approaches the dark. This, of course, is

only an optical illusion, but is so striking as to be capable of being applied with the greatest effect to a pictorial reproduction of any building or object, and so on.

#### KEYSTONES.

LORD BINGHAM has purchased Hereford House, Hereford Gardens, Park Lane. Extensive improvements are to be carried out immediately.

SOME of the chiefs of the Admiralty have inspected the site for the proposed new harbour at Dover. Boats were towed out to sea and moored, with the object of showing the line the new harbour will follow.

Two schemes, one providing for the erection of a People's Hall, and the other for a building to be utilised as a central institution for nurses in the north of England, are under consideration at Liverpool as a Jubilee commemoration.

As a contribution towards the completion of Truro Cathedral, it is proposed that the building of the nave and the lower portion of the western towers shall be proceeded with. The cost will be £45,000, towards which the Building Committee have in hand £22,746.

The Vicar of West Hartlepool (the Rev. W. F. Cosgrave) has just received a letter from Mrs. Gray, widow of the late Major M. Gray, offering to build a Church in the St. Oswald's district of the parish in memory of her husband. It is estimated that the cost of erecting the Church will not be less than £10,000.

A SPECIAL effort is being made to complete Battersea Polytechnic during the present year. When the institute was built, the erection of the great hall was deferred through want of funds. The proposed hall is estimated to cost about £6000; of this amount £2000 is still required.

A STAINED-GLASS window, erected at the east end of St. Giles' Parish Church, Newcastle-under-Lyme, has just been dedicated in memory of the late Alderman Mellard. The window has been supplied by Messrs. Hardman and Co., of Birmingham, the cost being about £1000. The design occupying the seven principal lights is the Crucifixion.

MEMBERS of the House of Commons are likely before long to have an opportunity of personally inspecting the Italian invention of telegraphy without wires. The proposal is to place the terrace of the House and the Members' cloak-room in direct communication, and, as a subsequent experiment, to send messages from St. Stephen's to Dover and from Dover to Calais.

THE Crowhurst, Sidley, and Bexhill Railway Bill, the object of which is to begin a junction with the South-Eastern Railway at Crowhurst, terminating at Bexhill, came before a Select Committee of the House of Lords, and was referred back to the Chairman of Committees as an unopposed bill. The capital asked for by the new company is £135,000, with borrowing powers to the extent of £45,000.

THE Bishop of Exeter, presiding at a meeting at Plymouth, held in furtherance of a movement for providing more Churches for the increasing population of Plymouth and the two neighbouring towns, stated if they could raise £21,000 a commencement could be made with seven new Churches. His Lordship promised £100 for five years, and announced that Lord St. Leven had promised £500 and the site for an additional Church at Devonport.

A FEW choice engravings of the Early English school came under the hammer at Christie's, when some good prices were realised. Bartolozzi's engraving in colours of Sir Thomas Lawrence's portrait of Miss Farren (Countess of Derby) sold for 59 guineas; the pair of prints known as "St. James's Park" and "A Tea Garden," after George Morland, proofs before the borders finely printed in colours, realised together 96 guineas; the engravings of Reynolds's picture of the Marlborough family, by C. Turner, proof before letters, 25 guineas; the Ladies Waldegrave, after the same, by Valentine Green, 51 guineas; and two examples from Wheatley's London Cries, "Primroses" and "Turnips and Carrots," in colours, 47 guineas.

## THE NEW GOVERNMENT OFFICES.\*

By H. H. STATHAM.

MR. H. H. STATHAM said that in that room they were bound to consider the treatment of Government offices from an Architectural point of view, both in regard to the most effective treatment of the buildings themselves, as an important element in our national Architecture, and to those questions of alignment of streets which came under the general head of what were called "public improvements." The subject was one of national importance. In order to appreciate the present position it would be well to look back a little. It was obviously important, both for Architectural effect and convenience of communication, that Government offices should be concentrated, and should be rebuilt from time to time in accordance with a definite scheme to which each new building would be a contribution. Such a scheme, on the grandest scale, had been drawn out by Sir Charles Barry in 1857, not only for the concentration of the Government offices, but for the improved laying out of the whole Westminster and Whitehall district. In 1856 took place the great competition for a plan for the concentration of the Government Offices and for special designs for War Office and Foreign Office buildings, as the result of which the War Office, though there was the most urgent need for it, was abandoned, and Sir Gilbert Scott received the commission for the Foreign Office. It had been attempted to show that the Foreign Office was a complete failure, and a proof of the mistake of erecting palatial Government offices designed by an outside Architect; but this was exaggeration; the faults which it had could easily be avoided in a future case; it was at all events a dignified building, and its quadrangle, of the dimensions of 240ft. by 170ft., was on such a scale as to have a really fine effect. The argument that such buildings would be better produced by the official surveyors of the Office of Works was sufficiently answered by the buildings which were so produced, notably the Post Offices, which were nearly all in a poor and commonplace style of Architecture. In 1882 the competition for new War and Admiralty offices was announced, not on the Great George site, as had been expected, but on a site near Spring Gardens, in which a part of the new building, for economy and to avoid purchasing some street property on the west side of Whitehall, was relegated to the rear of the houses. The opportunity afforded for

## WIDENING THE UPPER END OF WHITEHALL

by throwing back the west line of the street, pressed on the Committee by two eminent Architects, was entirely ignored. The next step was that this scheme was abandoned, the building of the War Office was again postponed, and the Committee of 1887 reported that the Admiralty could be economically provided for by retaining and adding to the old Admiralty buildings. He could not understand how any Government could sanction the retaining of a building with such an interior as that of the old Admiralty; nothing short of entirely gutting it could enable it to be made a satisfactory building, and the Architectural exterior was not worth that. The new buildings, though well planned, represented a design originally commonplace, though rich and costly, cut down to a cheap brick structure with stone dressings; the superficial richness being removed, only the commonplace remained. As a building for the administration of the greatest naval power in the world, it was little short of a disgrace to the nation. Coming to the Parliament Street site, the new proposed buildings there would be well situated parallel with the Foreign Office, but in order to produce their proper effect the design ought to range in its main lines with that of the Foreign Office and harmonise with it in character; to erect an inferior type of building would be to destroy the whole Architectural effect. The alternative proposal to set back the Parliament Street

part of the new buildings at an oblique angle, merely with the object of getting a full view of Westminster Abbey from a point eighty yards higher up Parliament Street, was absurd; it would be spoiling the whole building and throwing away part of a site, already too small, for an almost imaginary benefit. Coming to the question of the War Office, the fact that the money had been voted for the Carrington House site surely did not bind the Government either to build War Offices and no other on that site, or to decline enlarging the site by

## THE PURCHASE OF FURTHER PROPERTY.

It would be quite possible still to build the War Offices on the Downing Street site, and to provide for the Departments, now on that site, on the Carrington House site. This would realise, with some modification, Barry's fine conception of the War Office and the Admiralty Office as symmetrical blocks on either side of the parade ground, the Horse Guards in the centre. Probably none of the buildings on the Downing Street site could be permanently retained in such a case—the interior of the Treasury building even was too old-fashioned to retain; but the little domed vestibule of Dover House ought to be respected in any case, and could easily be worked into a new building. The vote for the Carrington House site had been unexpectedly taken; it was distinctly promised that the Committee would hold further sittings first, and it might be observed that for the first time, he believed, no Architectural evidence at all had been taken on a scheme so important in the Architectural embellishment of the capital. The official plan for the building on this site was a double mistake. In the first place, the shape of the building was to be settled by the irregular shape of the intersecting streets. That was an estate agent's and not an Architect's way of planning; it was reducing what ought to be

## A NATIONAL ARCHITECTURAL WORK

to the level of a block of flats or a monster hotel. In the next place, the site would be overbuilt both for Architectural effect and sanitary conditions; the largest quadrangle, into which rooms would look, was only 105ft by 100ft., for a building five stories high. There was no objection to building up Whitehall Place; it was shown that it was now an unnecessary street as far as traffic connection was concerned. The rest of the building could be planned symmetrically on the greater portion of the Carrington House site, the building line on the south side being brought in a little so as to make Horse Guards Avenue central with the Horse Guards, as it always ought to have been. It was absurd that a street facing a famous building and named after it should have been laid down out of centre with it; such a plan would be laughed at in Paris, but in London the alignment of streets and buildings was utterly ignored. Having got the extra width, they might then also make Horse Guards Avenue a real "avenue" by planting two lines of trees in it. When on the subject of what might be done, it was fascinating to go a little further and sketch out

## A REALLY STATELY SCHEME

for the combined treatment of the Admiralty and War Office. Suppose the old Admiralty removed; the new block already built might be lengthened southward a little, and returned towards Whitehall, with a similar northern block built on the foundations now being laid. On the centre of the fourth side of the quadrangle thus formed, facing Whitehall, would be the First Lord's house, with a columned screen and entrance on each side of it. Opposite to this he would buy up all the east side of Whitehall up to Craig's Court, and plan the War Office with a similar but shallower courtyard facing the quadrangle of the Admiralty, and the Commander-in-Chief's house or staff offices in the centre, facing the First Lord's house. The new block of the Admiralty would be retained in its interior plan but faced with stone to form part of a new and superior Architectural design. The whole west side of Whitehall up to Charing Cross would be set back on a new line to give

it an equal width all the way up, and above all to connect it with the axial line of Trafalgar Square, the Charles I. statue being moved a few feet to get it also on the point of meeting of the axis of Whitehall and the Square. The Mall would be continued through in a straight line into Charing Cross, the space between that and the Admiralty being occupied by street buildings forming the offices of the Woods and Forests and one or two other small departments. Speaking of that reminded him that the official plan showed the Mall continued through in the same way, but evidence had been given before the recent Committee, by Police-Superintendent Beard, that it would be

## BAD FOR HEAVY TRAFFIC

to come out of the Mall on to the slope of Charing Cross, that the exit ought to be taken up at an angle into Trafalgar Square. This, however, was beside the mark; if the Mall were to be given up to heavy traffic it had better remain closed, and the very object of opening it was the straight vista along it. He had spoken plainly on the matter, because it was a subject of national importance.—Mr. W. H. Brewer, in proposing a vote of thanks to Mr. Statham, commented on the importance of the subject under consideration, and said the matter resolved itself into the question, "Are we or are we not to have public buildings?" He agreed that the Admiralty building was not very interesting, but there was one thing connected with it which certainly ought to be preserved, and that was the very beautiful Board Room.—Mr. W. Woodward, in seconding the vote of thanks, severely criticised the scheme brought forward by Mr. Statham, and defended the Office of Works.—Mr. E. W. Mountford dealt with the question more in detail, and remarked that if they could persuade the Government that the new offices should be

## A THING OF NATIONAL ADMIRATION,

and not merely a means of housing Government departments, it would be a grand thing for England, and a still greater thing for London.—Mr. W. D. Caröe said the question what should be done with the Admiralty buildings was one which would soon have to be tackled, and he thought it would be best to build a narrow frontage, and fill up the front of the courtyard shown in the elevation in figure four.—Mr. E. W. Hudson was followed by Mr. John Burns, M.P., who urged that the members of the Sites Committee were not such vandals as might be supposed; as one of the members, he was anxious of considering the reorganization of the Government Offices from the point of view of Architectural harmony and beauty. He disclaimed any intention on the part of the Sites Committee to exclude outside Architects from giving evidence. In fact he would suggest to the Institute that a Council of Architects, resident or practising in London, be formed to formulate their views, not on small details, but as to the blocks of buildings which should occupy the space, between the National Portrait Gallery and the Houses of Parliament, and then select two of their number to lay those views before the Sites Committee. He was sure it was not too late for their suggestions to have that weight which they should have, coming from such a body. Personally, he thought that from Charing Cross right down to King Street there ought to be a fine sweep of Government buildings, the frontage, the height, and character of which he left to Architects. Furthermore, if it were possible, he was in favour of pulling down No. 10, Downing Street, notwithstanding the political and personal associations of the building, and having an easy incline into the park; they should clear the Treasury out of its present quarters and have the War Office where Dover House now stands. He was sure it was not too late to impress upon the Government the wisdom of erecting public buildings in a beautiful, and he might say scientific, manner.—The President spoke of Florence as setting a high example in striving after Architectural beauty, and after putting the vote of thanks to the meeting, called upon Mr. Statham to respond.

\* A paper read before the Royal Institute of British Architects on Monday night.

## Professional Items.

**ABERDEEN.**—The Works Committee of the Aberdeen Harbour Board has at present under consideration an important new proposal with regard to the question of additional shed accommodation at the quays. Some considerable time ago the Harbour Board approved of a scheme for the erection of two new sheds at Regent Quay, one 250ft. long and the other 150ft., and separated from each other by a space of 120ft., mainly to allow of the movement of wagons. Inquiries have recently been instituted, however, as to the shed accommodation in the large ports in the south, and it is pointed out that in the most important ports the system of two-story sheds is largely adopted. The proposal now is that, instead of erecting single-story sheds, the Aberdeen Harbour Board should adopt the two-story system. This would give, on the same ground area, double the amount of storage space. Not only so, but, as it is proposed to make the top story continuous, spanning the space of 120ft. between the two sheds, this would give a very considerable amount of additional accommodation. It is suggested that the sheds be constructed with a granite masonry wall at the street side, with masonry gables and division wall, the front, on both stories, having sliding doors along the whole length. The top story would be carried on a central and front row of steel columns rising from the foundation to the roof, with cross and longitudinal steel girders attached to the columns and resting on the masonry walls. The sheds would be capable of carrying 3½wt. per square foot of floor space on the upper story floor. The cost of two-story goods sheds of the dimensions stated, with lowering appliances, but not cranes, is estimated by the harbour engineer at £6565 and £3940 respectively; and the cost of carrying the top story over the intervening space between the sheds would be £2100 additional—in all, £12,605.

The Finance Committee of the Aberdeen Town Council has had before it plans of a block of buildings proposed to be erected on the east side of Albury Road, at an estimated cost of £6000. The plans were prepared in the office of Mr. G. F. Milne, Architect, 137, Union Street, on behalf of various clients. The Committee expressed complete satisfaction with the plans.

**BIRMINGHAM.**—The Estate Committee of the Birmingham Corporation reports the gift of four panels, designed and executed by students of the School of Art, for the further decoration of the Town Hall. The titles of the panels and the names of the Artists are as follows:—"Instrumental Music," by Mr. Sidney H. Meteyard; "Vocal Music," by Mr. Henry A. Payne; "Lench's Trust Almshouses," by Miss Kate E. Bunce; "Dr. Sacheverel," by Mr. Bernard Sleight.

**BRADFORD.**—The marble presentment of the late Sir Titus Salt, Bart., has been removed from opposite the Town Hall to Lister Park. The monument has been in position for some months near the main carriage drive at the western side of the park, but until the immediate surroundings were completed and suitably planted, full justice could not be done to the site chosen by the removal committee. The work of re-erection of the monument has been executed by Mr. Dawson and Mr. Frank Spencer, monumental masons, Bradford, under the direction of Messrs. Mawson and Hudson, Architects.

**CARDIFF.**—The new Post Office has recently emerged from its forest of scaffolding poles in Westgate Street. The area of the site is 4000 square yards, and the cost of the land and building has been £75,000. The total length of the front is 215ft., and the height from pavement to parapet 61ft. 6in., while the central tower rises to nearly double this height. The building comprises four floors. The basement, which is 8ft. in height, consists of

store-rooms. The ground floor is 24ft. in height, the first floor 14ft. in height, the second floor 16ft. in height, while above this, and forming the base of the central tower, is the third floor, which is taken up by the battery-room.

**DUMFRIES.**—The Provost's Committee recommended the Council at the last meeting to give its support to a scheme recommended by the infirmary directors, to raise £3500 to meet the cost of new buildings at the infirmary and to further endow the institution. The new buildings erected and in course of erection for infectious diseases and nurses' residence the committee proposes to call the "Victoria Hospital, and the three southern counties are to be asked to contribute to the fund. The recommendation was unanimously carried.

**GILDEESOME.**—The new offices of the Urban District Council were opened a few days ago. The offices occupy a building known as Grove House, which, together with several acres of land to be used as a recreation ground, have been purchased by the Council from Messrs. M. and T. Stephenson. Certain structural alterations have been made in the house, and the total cost of the property and the alterations has been about £2500.

**GLASGOW.**—On Saturday afternoon the last class visit for this session of the Architectural classes of the Technical College was paid to the New Art Galleries and Museum, Kelvin-grove Park, by permission of Messrs. Simpson and Milner-Allen, the Architects. The resident Clerk of Works showed the students over the building.

**HEELEY.**—The Primitive Methodists have built a new Church, Sunday School, and Institute in Ann's Road. £1700 was paid for the site of the new Church, but this includes nine dwelling-houses, which are still occupied. A substantial Church has been built on the remainder of the site at a cost of £5000, in which are sittings for about 750 people, commodious schools at the back for 800 scholars, and other rooms. Mr. W. J. Taylor was the Architect. Mr. J. Mason carried out the mason's work, Mr. Thomas Lee the joinery, Mr. Braithwaite the plumbing, Mr. Puttrel the decorating, and Messrs. Wright Brothers the installation of heating apparatus.

**KEIGHLEY.**—The foundation-stones of a new Sunday School, to be erected at the junction of Oakworth Road and Fell Lane, were laid on the 3rd inst. A site 2700yds. in extent has been purchased, and in addition to the school now being built there is ample room for a chapel and minister's house when required. The new building will include an assembly-room, three class-rooms, and a kitchen. The Architect is Mr. John Haggas, of Keighley. The cost is estimated at £1150.

**LEEDS.**—The new South Ward Liberal Club is now nearing completion, and a portion of the premises—the assembly room—will be ready for opening next month. The club rooms are expected to be finished by June. The premises, which are situated in Norfolk Street, are constructed of brick with stone dressings, and are two stories high, with a cottage at one corner for the caretaker. On the ground floor, which is capable of accommodating 600 persons, is a billiard-room, a smoke-room, and a reading-room. In the centre is a hall, and here the bar is located. The assembly room on the second floor is capable of accommodating 600 persons, and is entered by a stone staircase, leading into the vestibule at the Hunslet Lane corner of Norfolk Street. The staircase is surmounted by an octagonal tower, with a bell-turreted roof. Exclusive of fittings, the building has cost £3500, of which £520 was spent on the site. The plans have been prepared by Mr. Windsor Thorp, Architect, of Commercial Street.

The Baths Committee of the Leeds Corporation recommends the purchase by the Town Council of a corner of the West Riding

Athletic Ground, in Meanwood Road, as a site for the fifth set of public baths, which the Corporation some time ago decided should be erected in the Sheepscar and Buslingthorpe district. The area of the site to be acquired is 3748 square yards, and the sum for which the owner has agreed to dispose of it is £2998 8s., or 16s. per yard. The effect of the proposal, if carried out, will be to destroy the fine cycling track which was laid down a few years ago. It is expected that the site will be at liberty in about three months, by which time the Baths Committee hopes to be able to commence building operations. The remainder of the estate, it is said, is to be laid out as building land.

**PERTH.**—St. Mary's Monastery, Kinnoull, erected for the Order of Redemptorists, was begun in the year 1867, when the house, consisting of dormitories, refectory, library, kitchen, &c., was erected. In the following year the church, monastery, chapel, and crypt were built, and now the novitiates' wing, consisting of dormitories, common-room, library, and oratory, has been completed. The site chosen for the building is a very fine one, and the grounds are beautifully laid out in gardens, orchards, terraces, and walks. The Architectural treatment of the chapel is Early English Gothic, and the domestic parts of the building harmonise with that style, with simply moulded and arched doorways and deeply splayed and recessed window openings. The wall surface is of natural faced local stone. The interior, with the exception of the chapel and oratory, is simply treated in keeping with the severity of the tenets of the Order. The construction of the original building, church, and novitiates' wing cost about £20,000, exclusive of the site, altar decoration, furnishings, and fittings. The original building and church were designed by the late Mr. Andrew Heiton, and the novitiates' wing by Mr. A. G. Heiton, Perth. The following tradesmen were employed in the execution of the recent works: Mason, Messrs W. and C. Duncan; joiner, Mr. P. Johnston; slater, Mr. J. Carmichael; plumber, Mr. J. McLeish; plasterer, Mr. A. McRitchie; painter, Mr. G. Muirhead; glazier, Mr. C. Alexander; grates, Mr. A. McGregor; roadways, &c., Messrs. W. and R. Taylor.

**RUTHERFORD.**—A meeting held in connection with Rutherford Free Church during the past few days marks the completion of the improvement works. The painting and decorative work has been carried out by Mr. Edward Copland, Rosemount Viaduct. The roof of the Church, which has been entirely remodelled and heightened, is stained a rich dark oak colour in two shades relieved with gold. The pulpit is entirely new, and of good design, and has been stained in dark oak and gilded, the carvings being picked out in red. The front lobby is treated in blue and gold and terra cotta colour. The seating throughout the Church is all re-stained and varnished. The whole of the windows have been remodelled, and filled with leaded Cathedral glass.

**SWANSEA.**—At a public meeting held for the purpose of considering the proposal to proceed with the additional work of rebuilding the tower and chancel of the Swansea Parish Church, it was explained that the £15,000 required for the rebuilding of the nave had been subscribed, and towards the £10,000 required for the tower and chancel £2453 was promised. It was decided to at once proceed with the rebuilding of the chancel and the tower.

**WHITBY.**—There is on view at Mr. True-man's, Fine Art dealer, Whitby, two large water-colour drawings of Whitby Harbour, showing suggested dock-gates to keep the water in the upper reaches of the harbour for boating and other purposes, the carrying out of which many of the townspeople think would form a suitable Jubilee commemoration. The drawings were executed by Mr. G. Scaife French, Architect, Whitby.

## Trade and Craft.

### ACTION AGAINST A DISTRICT COUNCIL.

The case of *Smith v. Chorley Rural District Council*, heard in the Court of Appeal last week, was an appeal by the plaintiff from the judgment of Mr. Justice Kennedy after the trial of the action with a jury. The plaintiff proposed to build certain houses in the defendants' district, and deposited plans of the houses with the defendants. The defendants considered that the proposed houses amounted to the laying out of a new street, and disapproved of the plans upon the ground that the proposed street was not of the width required by their bye-laws. The action was brought for a *mandamus* to compel the defendants to approve and pass the plans. At the trial the jury found that the plaintiff by the proposed buildings was not laying out a new street. The judge, upon further consideration, held that an action for a *mandamus* would not lie, the proper remedy, if any, being by application for a prerogative writ of *mandamus*. He therefore gave judgment for the defendants. The Court dismissed the appeal, the Master of the Rolls holding that the defendants acted within their jurisdiction in every way.

### A CORPORATION AND ITS CONTRACTS.

Mr. Ernest Baggallay, the West Ham stipendiary, has held a public inquiry at Stratford in connection with allegations that the West Ham Town Council had been corruptly influenced in dealing with the contracts for the electric lighting of the borough. The inquiry arose out of a letter sent to the Corporation in December last from the Electric Construction Company, pointing out that the lowest tender had not been accepted, and that a gentleman had called on them offering to influence a member of the council in their behalf. The company called their secretary, who spoke to a man named Paris calling on them with reference to the contract, and saying he could procure the assistance of a member of the Corporation in obtaining the contract, but that the member would want to be paid for his services. Then Mr. D. Smith, an accountant in the same service, said that Mr. Councillor Hunns called on the company and strongly advised them to go in for the contract, and when asked directly the object of his visit he said he supplied different kinds of goods required in electrical work, and if those at the works were told he was to get a share of the orders he would get them. Mr. Paris and Mr. Councillor Hunns each gave their version of the affair, Mr. Paris saying he hoped to get a commission if he succeeded in convincing Mr. Hunns, as he believed that the Electric Construction Company stood high in the estimation of all engineers. He had no communication with or authority from Mr. Hunns to pay the visit. Mr. Hunns said he called merely in the course of his business, and had no thought whatever of a commission in connection with the contract. After a long sitting Mr. Baggallay said he would reserve his decision.

### MESSRS. LONGDEN AND COMPANY.

We have received from Messrs. Longden and Company, of Phoenix Foundry, Sheffield, a copy of their supplementary catalogue, illustrative of the numerous patterns of mantels, grates, &c., manufactured by them. There are several examples of mantels with Berlin black fronts in floral designs, with set of bricks and fall doors, and others with sliding rack blower; whilst one is shown of a very fine cast, with polished brass egg and dot mouldings fitted fast on. Another striking design is a mantel with a beaten brass panel and mouldings; whilst equally notable interiors are shown elsewhere varying greatly in pattern and treatment. Especially would we mention a series of grates with ornamented metal cheeks, fitted to bricks and fall doors, and in some cases with a warm-air grate, fire-brick body cased in iron, and grating and flap over the fire to regulate admission of fresh air; and also a further series of basket and dog grates, in which Messrs.

Longden and Company seem to have combined, as with their other manufactures, artistic merit with economy. The "Sunbeam" ventilating radiators which are illustrated in the catalogue have been constructed to meet the need for heating by conversion as well as by radiation. The "Sunbeam" has specially large air-tubes running through the parts which become heated, and therefore the passage of air is by no means impeded by friction. With the addition, too, of a closely gilled outer surface, the "Sunbeam" is undoubtedly one of the most powerful radiators now on the market.

### ACTION AGAINST A PARISH COUNCIL.

The Brixton Parish Council has just caused to be published a report of a case of litigation in which the Council had been engaged. In June of last year the Council advertised for tenders for the construction of a small foot-bridge at Torre. The brook at this point was crossed by two cover stones, which were a source of great danger, a child having slipped over these cover stones some time previously and been drowned. A tender was accepted, and the contractor commenced operations. On removing the cover stones a dilapidated wall, which was resting thereon, fell. The contractor immediately communicated with the occupier of the garden, promised to rebuild the wall, and to make good all damage which had been done to the occupier's crops. While this promise was being fulfilled a letter was received by the Clerk of the Council from the owner threatening legal proceedings in the High Court. A special meeting of the Parish Council was immediately called, and the clerk was instructed to write an explanatory letter, and to convey to the owner the regret of the Council at the accident. Before this communication could reach the owner the clerk was served with a writ to appear at the High Court of Justice in London. Another special meeting was immediately held, and it was unanimously decided to defend the case. Several letters then passed, without prejudice, with a view to settling the matter out of Court. In the meantime the Council's solicitor applied for a change of venue from Westminster to the Exeter Assizes. This was strongly opposed by the plaintiff. The application, however, was granted by the Master of the Court. Against this decision the plaintiff entered an appeal, which Mr. Justice Wills dismissed, with costs against the plaintiff, remarking at the same time that it would be a scandal for the case to be brought to London. Previous to this the defendants had paid 40s. into Court. This was ultimately accepted by the plaintiff in settlement of all claims.

### A NEW SYSTEM OF OIL LIGHTING.

A new system of oil lighting, brought out by the Imperial Oil Lighting Co., of 43, Cannon Street, E.C., is deservedly attracting much attention. By this new system a constant supply of oil is provided by a tank, placed in any out-of-the-way safe position, and controlled by a "feed" which is interposed between the tanks and the burners. The whole is so arranged as to ensure perfect safety; the "feed" prevents any possible overflow, and effectually cuts off the supply when the burners are not lighted. The feed is absolutely self-acting, and requires no attention; in fact, it is placed in a sealed box to prevent being tampered with. In chandeliers it is fitted in the central ornament of the fitting, but in brackets it is in a separate box. One feed will work any number of brackets on the same level, and it gives off the oil drop by drop where one burner only is lighted, or in a full flow when a number are burning. Explosion or firing is unknown where this system is in use, as the supply of oil in the cups is always at one level, and the burners, therefore always at their best. With so complete automatical arrangements much labour is obviously saved, and, in addition, an excellent light is provided with the greatest economy. This system places oil users on much the same convenient footing as gas consumers. It is claimed to be one-sixth the price of gas where it is cheap, and as much as sixteen times cheaper than gas in many country towns where the rate of the latter commodity is excessively high.

## SOCIETY MEETINGS.

### Sheffield Society of Architects and Surveyors.

The members of this society recently paid a visit to the new building of the Prudential Assurance Company, in Pin-stone Street, by the arrangement of the Architects, Messrs. Alfred Waterhouse and Sons. Mr. Haigh (the Clerk of Works), as the representative of the Architects, conducted the party over the building, and explained the various arrangements and the materials employed. He answered a number of questions asked by some of the younger members during their examination of the building. On the motion of Mr. T. H. Waterhouse, seconded by Mr. W. Parkin, and supported by Mr. Joseph Smith and the hon. secretary (Mr. C. J. Innocent), a vote of thanks was accorded to the Architects and to Mr. Haigh (the Clerk of Works).

### Leeds and Yorkshire Architectural Society.

At the ninth ordinary meeting of the Leeds and Yorkshire Architectural Society, Mr. W. Watson, of Wakefield, retiring president, occupying the chair, the following gentlemen, nominated at the previous meeting as officers for the session 1897-8, were duly elected: President, Mr. George Corson; vice-presidents, Messrs. W. S. Braithwaite and W. A. Hobson; hon. treasurer, Mr. W. H. Thorp; hon. librarian, Mr. W. H. Beevers; hon. secretary, Mr. F. W. Bedford; members of council (in addition to the permanent members), Messrs. T. Butler Wilson, C. B. Howdill, W. C. Hall, A. E. Kirk, George Atkinson, and James Ledingham (Bradford); auditors, Messrs. H. S. Chorley and W. Pott. Mr. W. S. Braithwaite moved a vote of thanks to Mr. Watson for his services as president during the past year, which was unanimously carried.

### East Riding Antiquarian Society.

At the second winter session held at Hull, Miss Lloyd read a paper on the sun-dial at Patrington, and Mr. J. R. Mortimer dealt with the novel subject of embankment crosses, in which he stated he had found whole fields covered with the design of a cross worked in embankments. The president (Canon Maddock) read a paper on the Registers of Holderness. He stated that although these could hardly be said to contain history, yet they contained the materials of history, and instanced how Macaulay was indebted to the parish registers of Leeds for a clue to its population in the time of Charles II. In them might be found the proof or disproof of reported epidemics and famine, and allusions to many old customs, such as burials at cross roads, burials in woollen, as well as remarks on the troubled times of the Civil Wars and the Revolution, as far as they affected the parish itself.

### The Institution of Civil Engineers.

At the ordinary meeting on April 6th, Mr. John Wolfe Barry, C.B., F.R.S., the president, in the chair, the paper read was on "The Blackwall Tunnel," by Mr. David Hay, M. Inst. C.E., and Mr. Maurice Fitzmaurice, B.A., B.E., M. Inst. C.E. Communication between the north and south banks of the Thames below London Bridge was very poor, and many attempts had been made during the last hundred years to give greater facilities for crossing. Various other schemes for tunnels had been brought forward, but that at Blackwall was the only one which had been commenced. The contract for the work was let in 1891 for £871,000, and operations were started early in 1892. The entrance to the tunnel on the north side of the river was in the East India Dock Road, close to the East India Dock gates, while at the south side the entrance was in East Greenwich. The total length of the tunnel was 6200ft., of which about one-half was "cast-iron lined," the remainder being "cut and cover" and "open approach." The open approach at each extremity of the tunnel was constructed with concrete and brick retaining-walls with a facing of white glazed bricks and a concrete invert. A layer of asphalt was carried round it to ensure watertightness. The cut-and-cover work consisted of four or five rings of brickwork in cement and was circular in section;

it was backed with a minimum of 2ft. of concrete, and a layer of asphalt was interposed between the brickwork and concrete. There were four shafts on the line of the tunnel, and these were placed at the horizontal or vertical changes of direction. They were constructed of steel and iron double-skinned caissons, of 58ft. external and 48ft. internal diameter. They had also an internal lining of white glazed brickwork. Two openings for the tunnel were provided in each caisson, which were closed when sinking by easily removable iron plugs. The "iron-lined" portion of the tunnel was constructed by means of a shield, and compressed air had been used for nearly the whole length, the pressure varying between a few pounds and about 27lb. above the atmospheric pressure. The external diameter of the cast-iron lining was 27ft. and the internal diameter 25ft. and 25ft. 4in., each ring of lining forming a length of 2ft. 6in. of tunnel. The tunnel was driven through materials of a very mixed nature, varying between hard watertight clay and coarse ballast in direct communication with the river.

**Society of Engineers.**—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on the 5th inst., Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. P. Michael Faraday, entitled "The Rating of Engineering Undertakings." The author commenced by pointing out the importance to engineers of a knowledge of the method in which the works under their control were assessed for the purpose of parochial rating, and next dealt with the capital required by the hypothetical tenant and also the capital belonging to the hypothetical landlord; and the point as to whether the various items going to make up that capital were to be taken at their prime cost, or at their value at the time of making the valuation, was discussed, in addition to the percentage to be allowed the hypothetical tenant as his share of the undertaking. The method in which stations, sidings, &c., of a railway company are assessed was explained, and also the subject of the rateability of signals at junctions. The deduction for the maintenance and renewal of the permanent way was dealt with, and the reason why viaducts and tunnels, &c., are not to be charged wholly to the parish wherein they are situated was also explained. The rating of branches belonging to the system of a large railway company where such branches are *per se* worked at a loss was touched upon, thus introducing the complicated subject of contributive value. Similarly the rating of canals was dealt with, and an explanation was given of how canals were formerly rated. The author explained that the buildings and reservoirs of the canal corresponded to the stations of a railway company and to the dead works of a gas or water company. The obvious advantage which an incoming tenant would have in the case of a water company, as compared with a gas company, owing to the fact that the former has statutory rights to collect its rates in advance, was pointed out, and the bearing which this point had upon the tenant's capital was shown to be very considerable.

**Association of Clerks of Works and Builders' Foremen.**—The members of this association paid a visit to the Bristol Cathedral on the 3rd inst. Mr. Hayward acted as conductor, and explained some of the most notable facts relating to the Cathedral, and also the different periods and diversity of style of Architecture in the different parts of the sacred edifice. This is the first of a series of visits to be paid during the coming summer to the various places of historical and Architectural interest in the neighbourhood.

**Building Trades Association of Manchester, Salford, and District.**—The annual dinner of the Building Trades Association of Manchester, Salford, and District took place early in the month at the Albion Hotel, Manchester. In the unavoidable absence of the president, Mr. Councillor Holland (Bricklayers' Association), the vice-president, Mr. George Macfarlane (Joiners' and Builders' Association) took the chair, and the vice-chair was occupied by Mr. J. Cantrill, treasurer (Painters' and Plasterers' Association). The

chairman was supported by Messrs. R. Neill, jun., W. Southern, C. H. Normanton, W. Jaffrey, W. Marshall, John Wilson, Fred Scott (secretary). There was a large representation of the seven trades combined in the Association. "The Building Trades Association of Manchester, Salford, and District" was proposed by Mr. H. Matthews, and responded to by Mr. J. Cantrill. The Chairman, in proposing the toast of "The Lancashire Federation of Building Trades Employers," said their object was to advocate the adhesion of the trades represented in the Manchester Association with the Lancashire Federation. The council of the Manchester combination had already considered the matter, and looked favourably on the proposal. The demands made upon the employers in the various trades had become so frequent, and often unreasonable, that organisation on a wide and comprehensive scale for the purposes of defence was becoming more and more an urgent necessity, and it seemed to him that the scheme of the Lancashire Federation met immediate requirements and deserved general and unqualified support. Mr. W. Cunliffe, in responding, explained that the Lancashire Federation was in no way antagonistic to the National Association, nor did they propose to invade in any degree the ground covered by the older body. They felt that a local combination covering a sufficiently wide area, and devoting itself exclusively to local interests, could render valuable services to the trades, supplementary to those rendered by the National Association. Nearly all the towns in the country had joined the Federation, and the only place of importance necessary to complete their organisation was Manchester. He made a strong appeal to the constituent trades of the Manchester Association to join the Federation. Messrs. Storrs and Tomlinson spoke to the same effect.

## Correspondence.

### SALARY OF CLERK OF WORKS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly inform me through your columns what is the recognised time for the salary of a Clerk of Works to cease? I have been acting as Clerk of Works and Draughtsman for an Architect in Yorkshire for the past twelve months. What I want to know is, am I called upon to remain in the employment of my present principal until the accounts are squared up, or only until the job is completed? My father being an Architect, and in ill-health, moreover himself being very busy—wishes me to return and assist him at the earliest opportunity. I should be very glad of your friendly counsel.

Yours faithfully,

April 5th, 1897.

UNDECIDED.

THE ancient Parish Church of Swinton, South Yorkshire, has been destroyed by fire. The damage is estimated at about £3000.

A SCHEME has just been adopted for building and endowing a cottage hospital at Worksop. A site has been given by Sir Henry Watson, and £1000 is to accrue to the scheme from the Dispensary.

At a cost of over £4000, additional coal bunkers are about to be constructed at Creek Bridge Wharf, Greenwich, for Messrs. William Dowell and Co. Mr. B. W. Adkin, 24, Queen Street, is the Architect whose plans have been adopted.

A FIRE broke out at the Leeds Covered Market on the 30th ult. The staircase leading to the gallery from the principal entrance in Vicar Lane was ruined, and a considerable portion of the glass roof of the building will require renewing.

MR. GEORGE BRIDGE HILLIARD, one of the best known auctioneers and valuers in Essex, has just died at Oxney House, Writtle, near Chelmsford, at the age of seventy-four years. The deceased, who was agent for all the English estates of St. Bartholomew's Hospital, was one of the founders of the Surveyors' Institution.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

**ABERBEEG (Mon.)**—For rebuilding "Hanbury Arms" Hotel, for Messrs. J. R. and T. A. Webb. Messrs. Swash and Bain, Architects, 3, Friars-chambers, Newport, Mon. Quantities by Architects:—  
A. E. Parfitt ... £2,575  
N. Bagley ... 6,331  
Williams and Thomas ... 6,090  
Powell and Mansfield ... 6,054  
Lawson and Co. ... 6,080  
Turner and Sons ... 6,018  
E. Mainwaring ... £5,913  
C. Lock ... 5,825  
W. A. Linton ... 5,800  
C. F. Morgan ... 5,697  
D. Lewis ... 5,633  
Horton and Co. ... 5,480

**ABERDEEN (N.B.)**—Accepted for the erection of hospital, Alford, for Alford District Committee, Aberdeen County Council. Messrs. James Duncan and Son, Architects, Turf:—

Masonry.—Alex. Grant, Alford ... £267 10  
Carpentry.—A. and W. Hendry, Wartle ... 270 0  
Slating.—S. and W. Christie, Dyce ... 82 10  
Plastering.—R. Moir, Inverurie ... 61 0  
Plumbing.—T. Laing and Sons, Inverurie ... 92 15  
Painting.—Fraser, Hutton, and Co., Insh ... 29

Total ... £1,002 15

**ABERTILLERY (Mon.)**—For the erection of Intermediate schools, Abertillery. Messrs. Swash and Bain, Architects, Newport. Quantities by Architects:—  
Turner and Sons ... £2,258  
D. Lewis, Llanhilleth, Mon. (accepted) ... 2,267

**BRADFORD**—For the erection of a house, stable, &c., Barkerend-road. Mr. G. C. Gamble, Architect, Parkinson's-chambers, Market-street, Bradford:—  
Masonry.—Wm. Potty and Sons ... £100  
Joinery.—W. Kellett ...  
Slating.—T. Nelson ...  
Plumbing.—Gell and Firth ...  
Plastering.—M. Bland ...

[All of Bradford.]

**BRADFORD**—For the erection of four through houses—Laisterdyke. Mr. G. C. Gamble, Architect, Parkinson's-chambers, Market-street, Bradford:—  
Masonry.—J. Schofield, Laisterdyke ... £268 16  
Joinery.—Hill and Nelson, Bradford ...  
Slating.—M. Slinger, Bradford ...  
Plastering.—D. Hamsworth, Fagley, Bradford ...  
Painting.—L. Sunderland, Great Horton, Bradford ...

**BOURNE END (Bucks.)**—For additions and alterations to the Platt, Bourne End, for Mr. F. C. Frye. Mr. Arthur Vernon, Architect, 29, Cockspur-street, London, S.W.:—  
Cox ... £875 0  
Silver ... 782 0  
Lovell ... 774 0  
combs\* ... £274 10  
\* Accepted.

**BURNLEY**—Accepted for the construction of a reservoir and other works, for the Corporation. Messrs. G. H. Hill and Sons, Engineers, Albert-chambers, Albert-square, Manchester:—  
W. Underwood and Bros., Dukinfield ... £7,871

**BURNLEY**—Accepted for the supply of 2,500 tons of limestone, and 500 tons of granite, for the Rural District Council. Mr. S. Edmondson, Surveyor, 18, Nicholas-street, Burnley:—

R. Briggs and Sons, Clitheroe ... s. d.  
Hugate Marsden, Salford ... 3 3  
P. W. Spencer, Conisley ... 3 7  
Brundritt and Co., Runcorn ... 6 0  
L. Cooper, Leeds ... 10 5  
... 8 6

**CATERHAM**—For the erection of a nurse's home at Infirmary Asylum, for the Metropolitan Asylums Board. Mr. E. T. Hall, Architect, 57, Moorgate-street, E.C.:—  
J. P. White ... £26,384  
Foster and Dicksee ... 6,128  
Leslie and Co., Ltd. ... 5,946  
Bulled and Co. ... 5,656  
Marriage and Co. ... £5,503  
S. Hipwell, Wisbech ... 5,091  
\* Accepted.

**COVENTRY**—For house, shops, &c., Stoney Stanton-road, Coventry, for Mr. Jesse Holliday. Messrs. Harrison and Hattrell, Architects. Quantities by Mr. J. M. Binley, Coventry:—  
C. Haywood, jun. ... £1,044 11 11  
C. H. Barber ... 1,010 0 0  
G. Storer ... 887 18 6  
R. Wootton ... £288 0 0  
T. G. Golby\* ... 873 0 0  
\* Accepted.

[All of Coventry.]

**DEWSBURY**—Accepted for the erection of six houses in North Park-street, Dewsbury. C. H. Marriott and Son, Architects, Dewsbury:—

Carpentry and Joinery.—William H. Clegg, Dewsbury ... £400 0 0  
Slating.—W. H. Thompson, Batley ... 117 0 0  
Plastering.—James Lockwood, Staincliffe ... 130 0 0  
Plumbing and Glazing.—J. Snowden and Son, Ossett ... 225 0 0  
Painting.—J. H. Jubb, Dewsbury ... 24 3 5

**DOVER**—For the erection of a car shed, Maxton, for the Town Council. Mr. H. E. Stilgoe, C.E., Town-hall, Dover:—  
G. E. Keeler ... £1,180 8  
W. H. Grigg ... 1,089 6  
G. Munro, Dover ... £1,000 0  
\* Accepted.

[Engineer's estimate, £1,030.]

**DUDLEY**—For building the "Station Hotel" stable buildings and premises at Dudley, for the Wolverhampton and Dudley Breweries, Limited. Mr. J. D. Wood, Architect, Birmingham. Quantities supplied by the Architect:—  
Brooks and Tandy ... £24,850  
J. Mallin ... 4,600  
Guest and Sons ... 4,465  
C. A. Horton ... 4,399  
Welb and Round ... 4,350  
Willcock and Co. ... 4,310  
G. Cave ... £24,298  
Lowe and Sons ... 4,193  
A. Lynex ... 4,191  
Harley and Son, Smethwick\* ... 4,190  
\* Accepted.

**EAST GRINSTEAD**—For alterations to "The Dormans Park Hotel," East Grinstead, for Messrs. Lethley and Christopher. Mr. John H. May, Architect, 254, High Holborn, W.C. Quantities by the Architect:—  
Young ... £1,174  
Longley and Sons ... 1,163  
Sobey ... 1,148  
Johnson and Co. ... £1,106  
Wall & Co., London\* ... 1,015

**CONTRACTS OPEN.****TO CONTRACTORS for TEMPORARY BUILDINGS and OTHERS.**

The Asylums Committee of the London County Council are prepared to receive TENDERS for the ERECTION of TEMPORARY IRON STRUCTURES at Hanwell Asylum, W.

Instructions for Tender and forms of Tender, contract bond, and bills of quantities can be obtained from the Clerk of the Committee, No. 21, Whitehall-place, S.W., on payment of 25, for which a receipt will be given, and the drawings can then be inspected at the office of the Resident Engineer, at the Asylum. The amount deposited will be returned on a bona-fide Tender being delivered within the appointed time.

Tenders must be on the printed form, and be accompanied by the forms of contract and schedules thereto and bond.

The Tender and accompanying documents, completed in accordance with the instructions, must be enclosed in a sealed cover, endorsed "Hanwell Asylum Temporary Buildings," and be delivered at the office of the Committee, 21, Whitehall-place, S.W., not later than TWELVE o'clock at noon, on MAY 10th, 1897, after which no Tender will be received.

Any Tender not made on the printed form or not filled up and completed in every particular in accordance with the instructions will be rejected.

The Committee do not bind themselves to accept the lowest or any Tender.

The contractors will have to enter into a bond in the penal sum of £2000, with two approved sureties each in the sum of £1000, as security for the due performance of the contract.

R. W. PARTRIDGE,  
Clerk of the Asylums Committee,  
Asylums Committee Office,  
No. 21, Whitehall-place, S.W.  
April 8th, 1897.

Price 3s. 6d.

**GLOSSARY OF TECHNICAL TERMS**

Contains explanations of over 2000 terms.

London: E. and F. N. SPON, 125, Strand.

**AUCTION SALES.****HARWOOD FARM BUILDING ESTATE,  
WATFORD, HERTS.**

Within half a mile of the High-street, and one mile of the Watford Junction Stations, London and N.W. Railway.

Important Sale of Freehold Building Land in a rapidly improving and increasing neighbourhood, suitable for the erection of a most lucrative class of Small Residences, Artisans' Dwellings, and Shops, for which there is great demand.

**MESSRS. HUMBERT, SON, and FLINT** are instructed by Messrs. BENSKIN, Limited, to SELL by AUCTION, at the Red Lion Hotel, Colney Butts, Watford, on WEDNESDAY, APRIL 28th, 1897, at Five o'clock precisely, about 420 PLOTS of FREEHOLD BUILDING LAND, most admirably situated, with frontages to good roads, and with depths varying from 100ft. to 140ft. The estate occupies an elevated position, has been most carefully laid out, and has immediate access to the centre of the town. The subsoil is gravel on chalk. The land will be sold free of Tithe and Land Tax.

Conveyances will, if desired, be prepared by the Vendors' Solicitors upon a moderate fixed scale of charges, and arrangements can be made for nine-tenths of the purchase-money to remain on easy terms, thus affording opportunity for the smallest capitalist to acquire his own Freehold.

Particulars, plans, and conditions of sale may be had

of Messrs. CROSSMAN and PRICHARD, Solicitors, 16, Theobald's-road, Gray's Inn, W.C.; of Messrs. SEDGWICK, TURNER, and ODDIE, Solicitors, Watford; and of Messrs. HUMBERT, SON, and FLINT, Watford, Herts, and 11, Serle-street, Lincoln's Inn, W.C.

**RADLETT, HERTFORDSHIRE.**

On the borders of Middlesex, adjoining the Radlett Station on the main line of the Midland Railway, whence there is a frequent service of trains to London, Important Sale of Freehold Building Land in convenient plots, and Freehold Villa and Cottage Property, with easy terms of payment extending over a period of three or five years.

**MESSRS. HUMBERT, SON, and FLINT** are instructed to SELL by AUCTION, at the RED LION, RADLETT, on MONDAY, APRIL 26th, 1897, at Four o'clock precisely, about 65 Plots of admirably placed FREEHOLD BUILDING LAND, with frontages of 16ft. to 30ft., and exceptional depths of upwards of 220ft.

The Estate is intersected by excellently constructed roads, has a gradual inclination to the south-west, and commands picturesque views over a beautifully-wooded landscape. The subsoil is gravel. Colne Valley water is laid on, and for the erection of Villa Residences this Sale offers opportunities rarely to be met with of acquiring building sites possessing all the advantages of rural and charming surroundings, at the same time being within thirty-five minutes of London. The land will be SOLD free of Tithe and Land Tax. Also

Two Freehold Villa Residences and Four Cottages, well built in brick and slated, and all let to excellent tenants, the Residences at £25 each per annum, and the Cottages to weekly tenants at 5s. 9d. each, the whole producing a gross annual rental of £109 16s., and forming a safe and remunerative investment.

Plans, particulars, and conditions of sale may be obtained of Messrs. SEDGWICK, TURNER, and ODDIE, Solicitors, Watford; and of Messrs. HUMBERT, SON, and FLINT, Watford, Herts, and 11, Serle-street, Lincoln's Inn, W.C.

# McNEILL'S FELTS (Roofing, Inodorous, Sarking, Dry Hair, Damp Course, etc.)

## CONTRACTS OPEN.

VESTRY OF SAINT PANCRAS.  
TO BUILDERS, SANITARY ENGINEERS, and OTHERS.

NOTICE is hereby Given that the Highways, Sewers, and Public Works Committee of the Vestry of St. Pancras will meet at the Vestry Hall, Pancras-road, on MONDAY, APRIL 19th, 1897, at SIX o'clock p.m., to receive TENDERS from persons willing to contract for the CONSTRUCTION of a block of UNDERGROUND CONVENIENCES in Mansfield-road, by Lisimore-road. Specifications and plans may be seen between TEN a.m. and TWELVE noon, at the office of Mr. WILLIAM NISBET BLAIR, C.E., Engineer and Surveyor to the Vestry, at the Vestry Hall, and quantities obtained on a deposit of Two Guineas, which will be returned on receipt of a bona fide Tender, or otherwise forfeited. Sealed Tenders to be delivered not later than SIX o'clock p.m. on the said MONDAY, April 19th, 1897, and endorsed "Tender for Underground Conveniences." The Vestry do not bind themselves to accept the lowest or any Tender.

By order,

C. H. F. BARRETT,

Vestry Hall,  
Pancras-road, N.W.  
March 25th, 1897.

CORPORATION OF LEICESTER.  
NEWARKE BRIDGE AND APPROACHES.

The Highway and Sewerage Committee of the Corporation of Leicester are prepared to receive TENDERS for the CONSTRUCTION of a CONCRETE and STONE BRIDGE over the Leicestershire and Northamptonshire Union Canal and Flood Course; and for the FORMATION of a NEW ROAD from "The Newark" to the Western Boulevard, together with a STORM OVERFLOW, FOUL, and STORM WATER SEWERS, and all other works in connection therewith. Plans may be seen, and copies of the general conditions, specification, and bill of quantities, &c., obtained at the Borough Surveyor's Office, on and after WEDNESDAY, APRIL 21st, 1897, on payment of the

sum of £2, which will be returned on receipt of a bona fide Tender.

Cheques, &c., to be made payable to the Leicester Corporation, and sent to the Borough Accountant. Sealed Tenders, on the forms supplied, addressed to the Chairman of the Highway and Sewerage Committee, Town Hall, Leicester, are to be delivered not later than TWELVE noon on FRIDAY, APRIL 30th, 1897, endorsed "Tender for Newark-street Improvement." The Committee do not bind themselves to accept the lowest or any Tender.

E. GEO. MAWBEE, C.E.,  
Borough Surveyor.

Town Hall, Leicester,  
April, 1897.

## TO BUILDERS and CONTRACTORS.

The Board of Management of the Central London Sick Asylum District hereby invite TENDERS for the ERECTION of a NEW ASYLUM at Hendon.

Bills of quantities can be obtained of the Architect on payment of Five Guineas, to be returned on receipt of a bona fide Tender.

The plans, specifications, and draft contract can be seen at the Offices of the Architects, Messrs. GILES, GOUGH, and TROLLOPE, 23, Craven-street, Strand, W.C.

Tenders to be sent in, on the form provided, not later than THREE p.m. on MONDAY, MAY 10th.

The Board do not bind themselves to accept the lowest or any Tender.

By order,

FRED. W. BAILEY,  
Clerk to the said Board.  
Clerk's Office,  
Cleveland street Asylum,  
Cleveland-street, W.

## TO ENGINEERS.

The Metropolitan Asylums Board are prepared to receive TENDERS for PROVIDING and FITTING-UP STEAM and CONDENSE MAINS, Hot-Water Warming and Supply Apparatus, and other Works, at the Western Hospital, Seagrave-road, Fulham, according to drawings, specification, and conditions of contract, prepared by Messrs. A. and C. HARSTON, Architects, 15, Leadenhall-street, E.C.

The drawings may be seen, and a copy of the specification obtained, at the Offices of the Architects, between the hours of TEN a.m. and FIVE p.m. upon payment of a deposit of Five Guineas, which amount will be returned to persons sending in a bona fide Tender, and returning the specification.

Tenders, sealed and endorsed "Tender for Engineering Work, Western Hospital," must be delivered at the Chief Office of the Board, Norfolk House, Norfolk-street, Strand, W.C., not later than TEN a.m. on WEDNESDAY, APRIL 28th, 1897.

The Board does not bind itself to accept the lowest or any tender.

By order,

T. DUNCOMBE MANN,  
Clerk to the Board.

Chief Office,  
Norfolk House,  
Norfolk-street, Strand, W.C.  
April 2nd, 1897.

## TO BUILDERS, CONTRACTORS, and OTHERS.

EAST ASHFORD UNION (KENT).  
PROPOSED NEW ADMINISTRATIVE BLOCK, ADDITION TO INFIRMARY, NEW CHAPEL AND ALTERATIONS TO EXISTING BUILDINGS, &c.  
Persons desirous of TENDERING for the above WORKS are requested to forward me their names and addresses.

Bills of quantities will be supplied for a fee of £1 1s., which will be returned on the receipt of a bona fide Tender.

The plans and specifications can be seen at the Workhouse, Willesborough.

Sealed Tenders, on forms to be obtained of me, endorsed "Workhouse Buildings," to be sent to me, on or before FRIDAY, MAY 7th, 1897.

The Guardians do not bind themselves to accept the lowest or any other Tender, and any Tender accepted will be subject to the approval of the Local Government Board.

No Tender will be accepted unless it comprises the whole of the Works.

HORACE HAMILTON, Clerk.  
No. 11, Bank-street, Ashford, Kent,

## HOSPITALS.\*

(Concluded.)

By FREDERICK BATCHELOR, M.R.I.A.I.

### SECTION II.—BLOCK HOSPITALS.

THIS class includes hospitals whose wards are arranged in different blocks, either isolated from each other or connected together, but in all cases having the wards exposed to the air, or, at least, two sides, so as to ensure cross-ventilation. This class may be sub-divided as follows:—

SUB-CLASS I.—Four blocks arranged in a square, but detached from each other, with a free space at each angle.

St. Bartholomew's Hospital, London, is illustrated as being typical of this class. The hospital at Carlsruhe, Germany, is another example.

SUB-CLASS II.—Two blocks in the form of an L. The typical form of this sub-class is shewn in the Royal South Hants Infirmary, Southampton. The vertical arm is a ward on the pavilion principle, the other ward being of the corridor type. Other examples are the General Hospital, Wolverhampton, and the North Devon Infirmary, Barnstaple.

SUB-CLASS III.—Three blocks in the form of a rectangular U or T. Of this type, the London Hospital, the University College Hospital, and the Guest Hospital, Dudley, are examples of the U class, and the Hardwicke Fever Hospital, Dublin, of the T class.

SUB-CLASS IV.—Three blocks arranged as an H. St. George's Hospital is typical of this class; other hospitals are the Bedford General Infirmary, and the hospitals at Chesterfield and Lincoln.

SUB-CLASS V.—Four blocks arranged as a hollow square, such as the King's College Hospital and the Royal Free Hospital, both of which are in London.

SUB-CLASS VI.—A single straight block, such as the Arbroath Infirmary, and the Inverness Northern Infirmary. The hospitals of this type are, for the most part, those which have been built early in this century.

### CLASS III.—CORRIDOR HOSPITALS.

The wards in this class are ventilated on one side only, being arranged on one or both sides of a corridor. The class is divided into two sub-classes:

SUB-CLASS I.—Single corridors, with wards arranged on one side of corridor, as, for examples, Chalmers' Hospital, Banff, and the Dundee and Grennock Infirmarys.

SUB-CLASS II.—Double corridors when the wards are arranged on both sides of the corridors, such as the Westminster Hospital, the York County Hospital, and the Whitworth Hospital, Dublin.

### COMPOSITE OR "HEAP OF BUILDINGS" HOSPITALS.

This group comprises all those irregular or composite plans which cannot properly be grouped in any of the foregoing classes. The

designed, for surely the maintenance of that principle is nowhere more necessary than in the erection of our hospitals. I propose, therefore, to deal firstly with the accommodation for patients, together with the nursing accessories; and secondly with the administration buildings. Under the first head are included the wards for the accommodation of the sick and their appurtenances; these necessarily form the basis of the design. Subsidiary to these are the operating theatre

BLOCK HOSPITALS. SUB-CLASS I.—ST. BARTHOLOMEW'S, LONDON.

plans in this class will be found in many instances to be those of old buildings to which additions have from time to time been made, often without regard to any consideration but the need of the moment. Having considered the general system of planning, and the resultant classification of hospitals, we must now turn our attention to the fabric itself.

### DESIGN.

With the question of external design or internal decoration I do not propose to deal. I would only urge the application of that principle to which I am sure we all agree, that is, that a building should be so designed as to express at once, even to the most superficial observer, the purpose for which it was

&c., and where there is a medical or surgical school, instructional accessories have to be provided. Under the head of the administration buildings are included the offices and lodgings for the staff, the kitchens, stores, and dispensary, and the out-patients' departments. These latter should, as far as possible, be arranged for in a separate building, and should not be placed under the same roof with the wards for the sick.

### WARDS.

The first principle of the ward unit is that the ward and ward offices should be self-contained within one door commanded by the nurses' room, so that at any moment she may know where every patient is. The size of the

\* A lecture delivered to the members of the Architectural Association of Ireland.—Ed.]

wards has to be somewhat guided by economy of administration, so as to enable the largest number of patients to be nursed by a given number of nurses. The limit of the ward is practically the number who can be efficiently nursed under one head-nurse.

#### WARD APPURTENANCES.

The ward appurtenances consist partly of nursing accommodation and partly of offices for patients. The nursing accommodation includes a bedroom, or a bed and sitting-room combined for the nurse, a small ward kitchen or service room, in which food can be warmed, drinks and extra diets, poultices, &c., made and hot water obtained. This room should be provided with a small range, glazed sinks with hot and cold water supplies, and cupboards for stores, medicines, &c. A hot closet should be arranged near, where linen may be kept and aired. The offices for patients comprise a lavatory, a bathroom with a movable bath,

BLOCK HOSPITALS. SUB-CLASS II.—ROYAL S. HANTS INFIRMARY.

and waterclosets in the proportion of from 8 to 15 per cent. of the number of patients. Hospitals, for acute cases, mostly in bed, require the lesser number. One or more slop sinks are also necessary, and a place for keeping the ejecta of patients for medical inspection. These appurtenances should always be cut off from the ward by ventilated lobbies, and should be warmed and ventilated independently of the ward.

#### SIZE OF WARDS.

In laying down the size of wards in relation to the number of beds, the floor space is the first thing to be considered; secondly, the wall space; and, thirdly (not primarily as so many people seem to think), the cubical area to be given to each patient. It is impossible to frame a hard-and-fast rule for the allowance of floor space per bed, but it may be taken that in wards for acute surgical and medical cases (excluding fevers) 100ft. is the minimum floor space per bed, and where it is necessary to obtain great width of ward, as in the case of clinical hospitals, the wall space must not be unduly diminished, but the floor area must be increased; a less distance than 7ft. between the centres of the beds is undesirable. Having determined the floor area, it is necessary to fix the height of ward, in order to obtain the requisite cubic space per bed. Here, again, differences of opinion exist. Many authorities on ventilation consider that any excess in height over 12ft. ought to be neglected in calculations affecting the movement of air, but as a rule the heights vary from 12ft. in small wards to 14ft. and 15ft. in large wards, with a cubical area per bed of from 1500ft. (the amount laid down by the Barracks and Hospitals Commission) for ordinary cases to 2000ft. for infectious diseases. The treatment of the walls of a hospital ward is a matter of considerable importance. It is absolutely essential to get as non-absorbent a surface as possible. Keene's cement has often been used, but is costly. The Adamant Plaster

Company, of Birmingham, make a patent plaster, which is considerably less costly, and is supposed to be equally hard. All internal angles of walls, ceilings and floors should be rounded to a radius of at least two inches, so that every portion of the surface is accessible for cleaning, and this principle should be carried out in the treatment of the door and window joints and finishings, avoiding all mouldings as much as possible.

#### FLOORS.

The question of floors has occupied much attention, and many have been the experiments to secure a floor where the risk of shrinkage, and consequent interstices for the accumulation of dirt, would be reduced to a minimum. In the new hospital at Derby, Terrazo, a kind of marble concrete has been used in the wards, but probably a system of teak flooring, in very narrow widths, keyed on the underside and doweled and laid and filled in with some bituminous material on a solid concrete bed, is as good a floor as has yet been discovered. Such a floor, if properly laid and of well-seasoned wood, becomes, when wax-polished, or paraffined, practically impervious. All the ward floors should be of fireproof construction, and should be as sound proof as possible. Mr. Henman, the Architect to the Birmingham Hospital, discovered that two materials of different densities, when placed in conjunction, produced an admirable non-conductor of sound, he therefore introduced into his hospital a system of cellular blocks of patent fibrous breeze concrete, bow-shaped in section, and about four feet long, laid between small steel joists which rested on I irons bolted to the web of the main steel joists spanning the width of the wards. The blocks are keyed on the underside for plaster, and the upper part is filled-in with cement concrete, on which the wood or terrazo floor is laid.

#### WINDOWS.

As regards the windows, these may be divided into three classes: 1. The double-hung sash, with or without a hopper or fan-light above. 2. The casement window, opening inwards or outwards. 3. The Middlesex window, which consists of three or more lights

in the ward in an upward direction. The position of the windows in a ward is regulated by the number of beds, and the form of the wards should be so arranged as to have a window at each side of the bed, the height

BLOCK HOSPITALS. SUB-CLASS IV.—ST. GEORGE'S, LONDON.

of the sill being fixed at such a level as that patients sitting up in bed or in a chair can see out, the head of the window being kept as near the ceiling as possible in order to utilise to the full the cubic space of the ward, and to avoid a stratum of stagnant air immediately beneath the ceiling.

#### VENTILATION.

Intimately associated with the subject of windows is the question of ventilation. Upon the necessity for ventilation there can be no doubt, and upon the fundamental principles which should determine the quantity of air to be supplied and the temperature at which it is to be supplied authorities are practically agreed. It is when these principles have to be reduced to practice that differences appear. Many authorities in England and Ireland, for instance, hold that the most efficient ventilation is to be obtained by the simplest means, whilst others, and particularly those on the

SINGLE CORRIDOR HOSPITALS. SUB-CLASS I.—ROYAL INFIRMARY, DUNDEE.

one above the other, each hung at the bottom and falling inwards, and all regulated by a rod or lever. Of these three kinds the one that most efficiently fulfils the conditions desired for a hospital window is undoubtedly the first. The mode of opening a double-hung sash is easy, and can be regulated to a nicety. If the bottom rail be made about six inches deep and a board five inches deep fixed against it, the lower sash can be raised and the air admitted at the meeting rails in an upward direction, on the Tobin principle, without any possibility of a draught at the sill. If, in addition to these sashes, there is a hopper-light above protected at the sides with glazed cheeks, the sashes may be closed whilst air is admitted high up

Continent and in the United States, consider it absolutely necessary to adopt more or less powerful means for forcing air-currents into and out of wards—possibly the secret of these differences lies in the special climatic conditions, involving great thermal changes, which have to be dealt with. Ventilation then, resolves itself into two systems. (1) Natural, that is unaided by mechanical contrivances. (2) Artificial or forced ventilation. Natural ventilation depends for its efficiency on windows and openings in the external walls, preferably on the Tobin principle, in order to cause an upward current of air, and regulated by valves—and also upon the ordinary smoke and air flues in the wards, these latter should be branched into a main extraction shaft,

communicating with a ventilating flue, and provided with a suitable cowl to prevent a reversing of the air-currents. The upcast draught is often assisted by introducing a coil of steam-pipes or by placing a Bunsen burner at the foot of the vertical shaft. Artificial or forced ventilation can be arranged in two ways, either fresh air can be forced into the wards, in which case, provided the inlets and outlets are properly arranged, the vitiated air must necessarily be forced out—or the foul air is drawn from the wards and is consequently replaced by fresh air. The first system is known as ventilation by impulsion, the second as ventilation by extraction. I have not time to discuss this most interesting subject in detail, but briefly the first system is to force air into the wards by means of a rotary fan, driven either by a small steam or gas engine or by an electric motor, the necessary temperature being obtained by passing the air over steam or hot water coils or calorifiers placed in the main air ducts. Frequently in town hospitals the air is washed and screened or filtered before passing into the ducts. There are several systems of extraction. One is by fitting up a rotary fan,

pipes become intensely hot, and the objection urged against it is that it tends to dessicate the air, and consequently to produce a feeling of oppression. I should very much like to have the opinions of members present upon this subject.

#### LIGHTING.

The question of artificial lighting must naturally resolve itself to-day into one of the relative values of gas and electricity respectively. It is, perhaps, premature to institute a comparison of cost between these two illuminants, because the materials available for forming a just estimate are not sufficiently certain or sufficiently numerous. Upon one point, however, there can be no question. Electric lighting involves no demand upon the oxygen of the air in order to support combustion, neither does it contribute in the slightest degree to the vitiation of the air—gas, however, does both these things, and therefore, for these two reasons alone, electric light is more valuable than gas. But it is also much more convenient. For instance, two wards of the Middlesex Hospital have been lighted by electricity, and over each bed is a fitting into which the wire from a hand-lamp

kitchen offices, the mortuary, and the laundry should be entirely isolated from the wards.

#### ADMINISTRATION.

We now come to the last section of our subject—that of Administration—and here again, as the time is very limited, I have borrowed somewhat largely from Burdett's book, for he has treated this subject in an admirably concise manner. The official or administrative part of a general hospital comprises the offices for the transaction of business, residences for the officers and servants, kitchen offices, stores, and, where there is no separate nursing home, the quarters for nurses. In a large clinical hospital to which is attached a medical school, the residential portion of the hospital will include rooms for numerous house physicians, surgeons, dressers, and clinical clerks. As a rule, these officers are quartered in the main building, sometimes, however, as in St. Bartholomew's, provision is made for them in a separate and distinct building, under the care of a resident warder. The nursing staff also ought to be lodged away from the wards. This is being done at many hospitals—notably the Middlesex—where only the sisters in charge of the wards sleep near their work; the main body of the nurses live in a separate home, self-contained and separately administered. The business part of a hospital usually consists of the board room, offices for the secretary, consulting room for the visiting staff, and lavatory accommodation especially for their use, also matron's or lady-superintendent's office. The steward's stores, frequently under the charge of the assistant-matron, vary in size with the requirements of the hospital, but should always include some kind of office and a place for receiving and weighing goods. The steward's office must be easy of access to the tradesmen and other persons whose business brings them into relation with this officer; it should be close to the store and also convenient to the wards. The kitchen offices comprise the kitchen, larder, scullery and servants' hall, and a small fuel stove, fed periodically from the main coal and wood stores, which are under the supervision of the steward. If these rooms cannot be provided for in a one-storied building, as is so often the case in a town hospital, owing to the restricted nature of the site, the proper position for them is the top of the building, first, because the smell of the cooking will not permeate the whole building, and secondly, because the kitchen will be lighted and more easily ventilated than in the basement. Assuming that there is a suitable room provided in which servants can have their meals, the kitchen should not be any larger than is actually required for use. Proper apparatus should be provided for the various operations of roasting, boiling, frying, grilling, and steaming. The scullery must necessarily adjoin the kitchen, and may advantageously be divided into two portions, one for washing crockery and cooking utensils, the other for the washing and preparing of vegetables, &c., both provided with large fire-clay and stone sinks, supplied with hot and cold water. The number and size of the larders depends on the size of the hospitals. If it be a large one, separate larders should be provided for cooked and uncooked food, milk and vegetables. Whenever the kitchen is on the top floor, there must be a larder near the kitchen for cooked food, and one in the basement for uncooked stores. The floors of kitchen, scullery, and larder should be of some impervious material. Tiles, tile mosaic, and asphalt are all more or less suitable. Granolithic, composed of Portland cement and granite chippings, makes an excellent floor, and is not very costly. The bedrooms for the female servants should be arranged in a group, with due regard for convenience of access to kitchens, &c. A box-room, bath-room, and w.c. should be provided, and the whole group should be under the control of the assistant-matron, who might, with advantage, have her bedroom near. If there are resident day and night porters, accommodation must be provided for them, but in any case a common sitting-room is necessary, where they can take their meals and smoke

CORRIDOR HOSPITALS. DOUBLE CORRIDOR. SUB-CLASS II.—ROYAL INFIRMARY, MANCHESTER.

arranged on a different principle, but driven as I have before described. Another is by introducing a jet of steam at very high temperature into the upcast shaft, thus producing a partial vacuum, and thereby causing a more or less powerful current.

#### HEATING.

On the subject of heating I must say but little—it is, of course, a subject closely connected with that of ventilation; indeed, in all systems of forced ventilation it forms an integral part, and cannot be considered separately. Open fireplaces are undoubtedly the best and most efficient means of warming a ward, and a not unimportant element in the matter is the question of appearance. An open fire adds unquestionably to the cheerful appearance of a ward, and the patients appreciate the feeling of warmth, which is quite independent of the actual temperature of the ward. Some grates—such as those patented by Saxon Snell, Pridgeon, Peale, and Sir Francis Galton—are arranged so as to admit fresh warmed air into the wards. The other systems of warming are by hot air on the Grundy principle, hot water pipes and coils or radiators on the low-pressure system, and a high-pressure system with pipes of small bore. In this last system the

can be inserted, and the contact is made in an instant, without even turning a switch. The advantage of such an arrangement is obvious, but it would be impossible with gas.

#### DISCONNECTION OF PAVILIONS.

We have now considered some of the conditions which should govern the internal construction of the wards so as to render them capable of being kept healthy, but a point which concerns the healthiness of a ward which has not yet been referred to is the connection between the ward and staircase and corridor which forms the common access to one ward and several others. The principle to be kept in view is the isolation, as far as possible, of each ward, with its offices, from atmospheric communication with any other ward or part of the hospital. It is desirable that each ward should be so separated from the main corridor and from the staircase by the interposition of a cross ventilated lobby, so that neither the one nor the other can become a carrier of infection from one ward to another. Often, in a restricted site, it is impossible to obtain the additional space necessary for this arrangement, but the principle is an excellent one, and should be adopted wherever possible. But, as a matter of course, the out-patients' department, the

whilst off duty. Lifts for food and coals, &c., should be arranged in the most convenient positions in regard to the kitchens and wards. The food lift may be worked by hand, but the coal lift, which is often combined with that for patients, should be worked either by hydraulic power or by electricity. Wherever the out-patient department is contained, as it ought to be, in a separate building apart from the hospital, a surgery must be provided in the main building, where accidents and casualties can be attended to when the out-patient department is not at work. Adjoining the surgery should be a small retiring-room, where a patient can, if necessary, be stripped and submitted to more thorough examination than would be possible in the surgery. Proper lavatory basins and sinks should be provided in the surgery, and communication with the dispensary arranged by telephone or speaking tube.

#### OPERATING THEATRE.

The Operating Theatre should be conveniently situated as regards access, both from wards and out-patients' department, but every possible precaution should be taken to prevent contamination of the air of the operation-room from these and every other source; every detail should be devised with a special view to its aseptic nature. Everything of an absorbent nature should, as far as possible, be eliminated. The room should be as small as possible, consistent with the convenience of operation; the walls should be of glass or glazed brick, the ceilings plastered in Keene's cement, painted and varnished; the floor of the least absorbent material obtainable, whatever that may be. The room should be lighted from the top, and, if possible, a large north window should be provided as well. The gallery for students, if it is necessary to have one, should be of teak, which is considered to possess antiseptic qualities, and the room must be provided with lavatories and sinks with special disconnections from drainage, an operating table, shelves, and cases for instruments, also electrical connection for galvanic and faradic currents. An ante-room, fitted with lavatory, should be provided for the surgeons or medical staff, also a room for administering anaesthetics. A small recovery room is also desirable. Separate operation rooms may also be required for gynaecological and eye operations. A lift should be provided, convenient to the operating theatre, of sufficient size to take a stretcher bed, and the attendants.

#### THE OUTPATIENTS' DEPARTMENT

should consist of a large waiting-hall for both sexes, or the use of patients from separate rooms for each sex, with registration office near the entrance, and small waiting rooms communicating with same, for new patients of each sex, and with w.c.s. separately arranged for each sex. The consulting rooms, which vary in number according to the size of the hospital, must be placed in direct communication with the waiting-hall, and the doors should be within sight of all patients. To each consulting-room should be attached small retiring-rooms, and corridors should be so arranged as to lead patients from the consulting-room to the dispensary waiting-room, and from thence patients would leave by a separate exit door. The hospital laundry should consist of wash-house and ironing rooms, and drying closets, rooms for the reception and sorting of foul linen, and also for the sorting and delivering of clean linen. Separate laundries are sometimes required for infected linen, with disinfecting chambers attached.

#### THE MORTUARY

and post-mortem room should be as far removed from the hospital proper as possible, but whether it should be approached by a covered way for the convenience of bearers and doctors is a vexed question. The pathological department is frequently arranged in connection with the post-mortem room.

Most serious allegations are being made with respect to the sanitation of a block of buildings let out in tenements in the Borough, London.

## Surveying and Sanitary Notes.

THE negotiations for the purchase from Lord Bute of Cathays Park by the Corporation of Cardiff on behalf of the town are reported to be progressing satisfactorily. Lord Bute has been immovable in the matter of insisting that none but public buildings shall be erected on the park, so that the hope of being able to lease a small portion for better-class residences, with a view of recouping the town some of the outlay and creating an estate which would prove in years to come of great value, has had to be abandoned.

At the last meeting of the Coventry Town Council the adoption of the agreement respecting the sewage scheme with Lord Leigh was proposed. Alderman Andrews said the schemes were not satisfactory. The difference between this scheme and one of gravitation was the difference between £90,000 and £150,000. He objected to the terracing proposed to be done at the farm, and said Burton-on-Trent was sorry it spent £10,000 on such work. He regretted that Coventry was saddled with the burden it was. The agreement was ultimately signed.

MR. G. S. ELLISTON, Medical Officer of Health for Ipswich, in his annual report, says the notification of infectious diseases has again played an important part in the sanitation of the town. The presence of infectious disease in the neighbourhood has frequently been the means of bringing to light grave sanitary defects. The annual report of Mr. George Moss, sanitary inspector and superintendent of the Refuse Removal Department, shows the large amount of sanitary work that has been carried out during the year, and the amount of refuse removed. A satisfactory agreement has been entered into between the inspector and a contractor to tip all the refuse that cannot be disposed of to farmers on a piece of land on the borders of the borough, to be treated there for trade purposes. This arrangement will do away for a time with the necessity of providing a destructor. The Building Sub-Committee continue to carry out their work in carefully examining all new plans and seeing that the proposed works are carried out in accordance with the plans deposited. The Building Inspector reports that of the 317 new houses built in 1896, 235 were connected with the sewers, and 82 to dead wells under his supervision; that he paid 2860 visits to new buildings, and 2740 visits of inspection to drains. He estimates that during the past year about 600 old houses have been connected to the public sewers. Many sanitary improvements have been carried out during the year, the principal being the driving of a new street through Bond Street from St. Helen's Street to the Rope Walk. Since the new street has been opened he had condemned as unfit for habitation a block of fifteen houses, eight being in Long Yard and seven at the rear of it, and facing the new street. These houses are now in course of demolition, and formed a portion of the old Upper Orwell Courts, one of the most unhealthy areas in the borough, and formerly one of the nurseries of epidemics.

OPERATIONS have just been commenced in connection with the construction of the Holywell-Milwr tunnel, Flintshire, which is designed to drain Milwr Mines and to discharge into the River Dee at Bagillt. The completion of the tunnel is regarded with some amount of interest on account of its possible bearing upon the effluent of St. Winefride's Well at Holywell. A good many geologists and mining experts consider that one of the principal feeds of the "miraculous" spring comes from this direction, and that the construction of the tunnel will materially reduce the outflow at the well, and consequently the value of St. Winefride's stream to the factories in the Greenfield Valley.

## THE MANCHESTER SEWAGE PROBLEM.

AT a meeting of the Manchester Statistical Society, Mr. Nathaniel Bradley read a paper on the Manchester sewage problem, in the course of which he stated that the scheme of the Manchester Corporation Rivers Committee was for the culvert to discharge at Randall's sluices. The Rivers Committee had a double object in that proposal; firstly, to keep the canal from pollution; secondly, to get away from the jurisdiction and impractical requirements of the Joint Board. The Committee had also decided that the cost of maintenance for artificial filters, and for the chemicals for precipitation, also the large sums of money which would have to be paid in wages, would far exceed the interest and the cost of attending to the culvert. When it had the culvert it would not be constantly harassed by law, it would be perfectly free, and it would be as grand a thing for Manchester as was the bringing of pure water from Thirlmere. He contended that in the case of Manchester the filtration of sewage through the land was both costly and impracticable, and that all bacteriological schemes which had been tried on a large scale had also proved failures or too costly. Artificial filters for Manchester, as estimated by the City Surveyor, with contingent works on the lines indicated by Sir Henry Roscoe, would cost £220,000; and to this sum would have to be added the annual cost of working the filters, which, at the ascertained cost of filtering sewage under similar conditions, would be £5220 per annum. This was exclusive of the cost of renewing the filtering material. The cost of the proposed culvert, even if it was constructed as far as Randall's sluices—that was to say, direct to tidal waters—would not exceed £258,000. To this sum must be added the estimated annual cost of working the sluices and of inspection, which would not exceed £200 per annum. By the adoption of this scheme the sewage problem for Manchester would be solved at once and for all time, and would result in a saving of £3880 per annum in favour of the culvert scheme. Notwithstanding the evidence as to the economy and efficiency of the culvert scheme, in all probability the Corporation would be forced by the attitude of the Mersey and Irwell Joint Committee to enter on a useless and expensive series of experiments with artificial filters. Instead of complying with such foolish demands, the Corporation ought to resist them strongly, and, if necessary, lay the facts before the Court when called upon for an approved scheme in September next. The judge would not request the Corporation to incur needless expense in useless experiments if the culvert scheme was properly laid before him. His proposal in the present difficulty was to ask for an Act of Parliament to create a new Department, which should be called the Government Sanitary Court, and should employ permanent sanitary chemists and sanitary engineers, whose services should be exclusively devoted to this Department. The Act should require that all places and rivers in England and Wales should be suitably grouped, and that all streams should be classified by their natural watershed or the main river into which they ran. Therefore he proposed that, in accordance with the number of inhabitants living under any particular district council or town council, a member or members should be elected to represent them in proportion to their numbers, such members to be compelled by the Act to form joint boards for the particular districts. Further, the chairman of each board should be one of the chemical and sanitary engineers from London, and be changed from district to district, it being his duty to act under the advice and direction of the Government Sanitary Court and of the joint board for the watershed or main river.

THE Local Government Board has refused the application of the Crewe Town Council to sanction a loan for the construction of a crematorium on the hospital site for the destruction of refuse.

### The last of Chelsea Reach.

CHELSEA REACH is doomed, and the Artists are in tears. The tide of progress sweeps on, bearing down before it the old, the outworn, the picturesque, and the decayed. Our friends who love these things are not to be consoled. Truly our sympathy is with them, but let them take heart. All things mellow in time, other improved places are even now ripening, and the day will doubtless come when the all-dreaded Embankment will lose the first rawness of youth, and wear the rich and subdued colours they love so well. Perhaps the Artists of that day will find a statelier and more ordered beauty in the long simple line of weather-beaten granite, opposing its still changeless front to the ever-shifting swirling waters. We think they will, but they will not care to make pictures of it, perhaps, and herein lies the trouble. Our Chelsea friends are painters; a painter's idea of Art begins and ends too often with an easel picture; his interest is confined to appropriate subjects for the same. The simplest, and therefore the grandest, works either of Nature or of plastic Art, do not lend themselves readily to pictorial treatment. Whoever painted the horizon line at sea without introducing a boat, to rob it of its grandeur but make it a picture? The universe was not created to be seen through a gilt frame. Cities are not built to encourage the spoiling of canvas. Let the painters attend to their proper business and decorate the walls of our buildings, there will then be less need of views to hang upon them. The quaint and irregular lines of the wharves and buildings of all descriptions that line the banks of too much of our river—are these things beautiful in themselves? Was not the original state of the bank preferable, before man laid his hand upon it? No doubt the Artists of those days lamented over each stretch of greensward and ridge as it disappeared, and anathematised the very works over which their descendants are spending so much admiration. There are two things worthy of the enthusiasm of the thoughtful Artist—Nature and Art. The banks of the river in their present state are neither one thing nor the other. To preserve their natural state is impossible—would be a paradox. As we cannot have Nature, let us have Art. Curious is the connection between the picturesque and the unhealthy; between the town as beloved of the painter, and dirt, disease, and death. The long arm of coincidence, perhaps, or possibly cause and effect. Clare Market, with its squalor, its fetid atmosphere, its ramshackle houses, was characteristic and full of subjects eminently paintable; but the new blocks of artisan's dwellings will inspire no pictures. Every new street, driven through foul and reeking alleys, letting in the light and air of heaven, though it destroys much of human and possibly something of Artistic interest, is yet a boon. However much we may deplore the destruction of memorials of the life, the struggles and the ambitions of the past—buildings haunted by the memories and voices of the dead, harmonised by time into subjects for the painter's brush—yet we cannot but feel that the pictures that possibly might be painted from them would not compensate the living for their general unwholesomeness. Is not health the greatest blessing? Is not cleanliness above

the picturesque? Are human beings to be condemned to inconvenient and unhealthy surroundings that painters may come and make pictures of them? The pity of it is that new improvements are carried out in such a paltry and undignified manner, that the scheme is never handled with breadth and simplicity, that the hand of the Artist is never apparent. Here, surely, is common ground for the united efforts of all lovers of Art. Let them see to it that every new improvement is an artistic one, that every scheme is approached in a right spirit, and is under the control of an Artist, and not an engineer or official; let them spend their energy and enthusiasm over the things of the present rather than the past; let them create something both new and beautiful. Let the painters of Chelsea who bemoan their

British Admiral whose memory is considered worthy of honour by the citizens of London. When we consider the claims of the fifty-nine statues of public men now adorning London, we cannot believe that the exclusion of all British seamen other than Nelson is wholly justified on account of their inferior merit, virtue, or gallantry to those of some of the worthies commemorated by a public statue in the capital of the Empire. It would be invidious and unnecessary to suggest that some of these statues might disappear in favour of Blake, Jervis, Dundonald, Collingwood, or Rodney. It has, however, been proposed that Trafalgar Square should be cleared of all the existing statues, with the exception of Nelson (though it was only at the last meeting of the Royal Institute of British Architects that the suggestion was made that the

Donegal Castle  
Donegal Castle

FROM A SKETCH BY L. EDMUNDS.

Embankment accept the inevitable with a good grace, and do what they can to obtain one that shall be a credit to the City, and an improvement from an artistic as well as from a material standpoint. We assure them it is possible.

### London Naval Statues.

It is a rather astounding fact that in the Metropolis there are but two statues of British Admirals. In fact, it might be said without exaggeration that there is only one; for the statue of Sir John Franklin, in Waterloo Place, was erected, not because he was a British Admiral, but on account of his achievements in connection with Arctic exploration. There is, therefore, but one fighting

Nelson statue, too, should be removed and set up in Leicester Square), and that the vacant sites should be occupied by the statues of great British seamen, while Waterloo Place should be set apart for great British soldiers. Trafalgar Square would then be indelibly associated in the public mind with the seapower of Great Britain, and the public from the provinces, as they passed southwards to the Houses of Parliament, eastwards to Charing Cross Station, northwards to the National Gallery, or westwards to Hyde Park, would be confronted with an object-lesson in the history of our country which has too long been hidden from the masses. But, it will be said, what is to become of Napier, Havelock, Gordon, and the rest of the great men gazing up at Nelson from the finest site in Europe? The answer is simple. If Waterloo Place be inadequate

to receive them, the stretch of the Embankment, from the School Board to the Houses of Parliament, is a broad road in which twenty statues could be erected without interfering with the traffic. At the present time a few statues of more or less distinguished men are caged in behind the railings of the Embankment gardens, but the proper place for a statue is a public thoroughfare where men and women, in the course of their journeyings on business or pleasure, can gaze upon the features of the departed dead and be reminded of the deeds which have made them famous. As there are only fifty-nine statues in the whole of London, should the embankment site be still considered undesirable by those responsible for the Artistic problems of the great City, there is ample room elsewhere to do honour to Napier, Havelock, and Gordon. The space round the statue of our great sea-captain should be reserved for the memorials to his illustrious predecessors, companions, and successors. The finest site in

## A CITY OF ART.

MUNICH teaches two memorable lessons, says Sir John Leng, M.P., in an article in the Dundee Advertiser. First, how much the cultivation of Art may do for the prosperity of a city; and, second, how much one enthusiast may do for the encouragement of Art. It may be quite true, as is sometimes alleged, that many of the buildings in Munich are copied from well-known Classical edifices in Italy and elsewhere, but in defect of original conceptions it is something to have reproduced and brought together so many good copies of notable structures. It may also be true that most of the best paintings in the Galleries are not by native Artists, but of what place cannot the same be said? It is at the same time unquestionable that the collections in Munich are of great merit, that they contain some splendid pictures, and that they are admirably

greatest of all are Durer's "Peter and John," and "Paul and Mark." Art has never achieved anything grander in portraiture and figure-painting than these noble heads and majestic figures. Rembrandt's "Ascension," "Resurrection," and "Entombment" are also exceedingly powerful. The Madonna with Jesus and John the Baptist, and Christ crowned with thorns, are lovely Titians. There is also a beautiful Raphael—the "Madonna Tempi." These are only a few outstanding works amongst a multitude of Art treasures. Besides the pictures, there is a fine arcade with

## HISTORICAL FREScoes BY CORNELIUS,

and very large cabinets of engravings, drawings, and vases. The new Pinakothek contains a well-arranged collection in eleven rooms and fourteen cabinets of modern pictures chiefly by Munich Artists, and very interesting many of them are. The Glyptothek is a square building with a quadrangular court divided into thirteen

DONEGAL CASTLE. SKETCH BY L. EDMUNDS.

Europe is not too fine to be set apart for the memorials of our great naval commanders. Everything that emphasises the fact that upon the basis of sea-power England lives and moves and has its being is a healthy influence on national life and character. Consider what the French would have done had they defeated the Armada! How many statues of a French Drake or Lord Howard of Effingham would have adorned the streets and boulevards of Paris? So far as we are aware, with the exception of the old anchor that lies on the pavement outside the United Service Institution, there is no monument of any kind in London which would remind a Briton that such an event as the Spanish Armada ever took place. The reservation of Trafalgar Square for naval heroes would be the best method of accomplishing what is wanted.

arranged. The old and new Pinakotheks, the National Museum, the Glyptothek, and the Palace, out of a multitude of public buildings, are especially worth visiting, and one advantage of Munich is that the buildings are within moderate distances, and everything easily accessible. The old Pinakothek is a building 500ft. in length, by 90ft. in width and height, and is a model building for its purpose—the exhibition of masterpieces of Art—the interior being divided into twelve different saloons for each school—the Italian, Venetian, Flemish (with a special room for Rubens), Dutch, French, &c. Hither have been brought some of the finest specimens of the work of the greatest masters, amongst the most notable of which is Holbein's triptych, "The Martyrdom of St. Sebastian," with Saints Barbara and Elizabeth at the sides. But perhaps the

saloons filled with marble sculptures, busts, statues, and groups of figures, the contents of which may be inferred from the names of the halls—Assyrian, Egyptian, Æginetan, Apollo, Bacchus, Niobe, the Gods, Trojan, the Heroes, Roman, Coloured Sculptures, and Modern Works. Besides these remarkable buildings there is the Bavarian National Museum, crowded with exhibits illustrating the history and life of the Bavarian people; and the Maximilianeum, a building dedicated to the higher instruction of students for the Civil Service, which also contains a number of fine paintings. The painting and staining of glass are branches of Art in Munich which give employment to many Artists and work-people. We visited two of the largest establishments, and were courteously shown through them by the principals.

## In Istria and Dalmatia with a Camera.

By W. LAW BROS.

### I.—ISTRIA.

**T**O the lover of Architecture there is no more enjoyable way of spending a holiday than in visiting some district far away in place and time, and comparing the buildings there to be found with those of former experiences. Among such districts I know of none of more profound interest than the coast line of Istria and Dalmatia. Easy of access, it contains many buildings of Roman and Venetian work, of which the accompanying illustrations will speak for themselves of the importance and artistic value. Having crossed the Alps, passed through Venice, taken steamer to Trieste, I commenced the first stage of my pilgrimage along the coast of Istria to Pola. Out of the land of railways, all journeys are made by steamers, which, however, are frequent and comfortable, and calls are made at many small ports whose names were unknown to me before, but many of which stand out pictur-

interior having been removed by the Venetians. Its proximity to the sea and the cheapness of water carriage to Venice caused it to be used as a quarry during the Middle Ages, and if you want to find the stones which formed the countless rows of seats to accommodate the 25,000 spectators which this amphitheatre is estimated to have seated, you must search for them among the palaces which line the Grand Canal at Venice. This outer shell is, however, perfect, and in this respect the amphitheatre of Pola is unique. Its huge stones remain in their places solely by their own weight and accuracy of the fitting; no cement or mortar has been used to set them, and they appear in their ruined majesty to defy the ravages of time. There is another peculiarity in this amphitheatre which has never been satisfactorily explained: equidistant along its outer circumference are four towers or projections rising to the same height as the main walls, and corresponding to them in every way, but projecting from them some 12ft. What was the function of these towers? The most probable suggestion is that they may have contained private staircases for the use of the men who worked the huge velarium or awning which was stretched as a temporary roof on the days of spectacle. The sockets of the supporting masts are still to be seen in all but perfect condition. The openings in the upper stones of these towers deserve attention; they are

ROVIGNO.

blocked up by curious screens of perforated or plate tracery, which seem to indicate a strong Eastern influence. I have seen somewhat similar work in Spanish towns bearing the strongest marks of Moorish influence, and further south, at Trau, on the Dalmatian coast, similar tracery may be seen in the tower of the Cathedral, but in Roman work it seems unique.

But even were these stupendous remains of the amphitheatre not in existence, there are other Roman buildings of sufficient importance to render Pola a worthy rival of Nimes or Trier.

A few paces off you see a triumphal arch, not, indeed, so lofty or majestic as the arches of Rome itself, which you would hardly expect in a provincial city, but erected at the best period of Roman Architecture, that of Augustus. It commemorates the battle of Actium, B.C. 30, and is dedicated to the family of the Sergii, from whom is also derived the name of the Roman road which entered the town under this arch, and which still remains the Via Sergia.

Of a slightly later date is the temple of Augustus, A.D. 8, whose six magnificent Corinthian, or rather composite, columns still proudly support the noble pediment. This building is appropriately, but not very efficiently, utilised as a museum; its confined space and ineffective lighting make it difficult to see the marvellous collection of sculptures it contains, but which proves that whatever may be the wealth of Roman buildings of modern Pola, they are a mere fraction of what was included in the walls of Pictas Juliu. Unfortunately, the position of this temple, among a net-work

PIRANO.

esquely from the blue Adriatic. Early among these is the station of Pirano, which is here illustrated, its lofty thirteenth century Cathedral rising grandly above the pyramidal mass of houses. Passing the similarly situated town of Rovigno, whose mediaeval girdle of walls and bastions can well be seen from the steamer, one is reminded that these seas were for centuries the fighting ground between Venetians and Hungarians; while pirates from the coasts of Turkey, Greece, and Barbary were always threatening to make a raid upon any city which was not prepared to defend itself. After a journey of about eight hours from Trieste, the harbour of Pola is entered, the vessel steering between a vast mass of small islands, each of which is crowned with a modern fort. Pola is the great naval station of Austria, and her port is crowded with war vessels, from the huge ironclad to the tiny torpedo boat. Approaching the town, one sees the Roman amphitheatre rising majestically above all other buildings: this amphitheatre was erected in honour of the Emperors Caracalla and Septimus Severus (198-211), and measures no less than 436ft. along its longer axis by 346ft. along its shorter. These dimensions are only exceeded by three others, those of Rome, Capua, and Verona. It is built on the side of a hill, for the sake of economy, and on the land or rear side the three massive stories diminish to two in consequence. Approach it more nearly, and you see that it is now merely an empty shell, the whole of the masonry of the

same height as the main walls, and corresponding to them in every way, but projecting from them some 12ft. What was the function of these towers? The most probable suggestion is that they may have contained private staircases for the use of the men who worked the huge velarium or awning which was stretched as a temporary roof on the days of spectacle. The sockets of the supporting masts are still to be seen in all but perfect condition. The openings in the upper stones of these towers deserve attention; they are

PORTA GEMINA, POLA.

of narrow lanes, renders it impossible to obtain a satisfactory photograph. The same may be said of the temple of Diana, which, however, is far more mutilated, and of which only the rear front exists entire.

Many fragments of the old walls of the Roman buildings still exist, and more than

The superbly twisted columns of alabaster which support the canopy over the high altar at St. Mark's, and which the custodian unblushingly asserts to have come from the Temple of Solomon (or at least did so the last time I visited Venice), were in reality looted from the Cathedral at Pola.

ROMAN AMPHITHEATRE, POLA.

mere fragments, for there is one gate entire and one nearly so. Of the former, the Porta Gemina—as seen by the illustration—is, perhaps, the best specimen of a purely military gateway in existence, with traces of the guard chambers on each side still to be found. The antiquarian who visits the ruins of Roman stations at Silchester, or the still more important ones of Borcovicus or Cilurnum which guarded the Caledonian frontier of the Roman Empire, and supported the great wall which stretched from sea to sea, will have no difficulty in reconstructing from the remains there to be found a gate similar to the contemporary gate at Pola.

If you hunt through the narrow lanes which cover the site of an old city such as this, you will discover in all directions specimens of Roman-worked stones, which are to be found in plenty, and which there is no difficulty in detecting. In the accompanying illustrations may be observed a case in point. There is a shrine to the Madonna, such as one frequently sees in Southern Europe, but on examination it will be found to be of comparative recent construction. But where did the materials come from? The two columns are evidently Roman—it does not require two glances to decide that—but the curiously interlaced carving of the stone, cut into the form of an arch, which is supported by them? Examine also the sculptured slabs inserted on either side, one of which is surmounted by a Christian cross. These are evidently antique, but nothing could be farther from Roman forms of design than these interlaced and luxuriantly florid styles. Modern archaeology is disposed to think that such forms took their rise in the Mycenaean area; certainly they were adopted and modified by the Byzantine, Celtic, and Scandinavian races, and one must look in some such quarters for the carvers of these stones. Were they brought from Byzantium in the time of its prosperity, or from its nearest successor and rival, Ravenna, or, finally, are they the work of some of the foreign legions of the Empire?

Of mediæval remains in Pola but little of interest is to be seen. Oppressed and plundered by its captors, the Venetians, nearly all portable works of Art have disappeared; and the buildings in which they were housed, although fine, can only claim a secondary place. When Roman Architecture of the first class is to be found in such profusion, one does not care to spend much time over second-rate modern work.

#### MODERN HOUSE INTERIORS.\*

By T. BUTLER WILSON, F.R.I.B.A.

FOR some years past the educated public have manifested a strong desire to make the interior of their houses Artistic, and are still exhibiting a strong interest in interior decoration and furniture. Hence the country is being scoured for examples of old furniture, plate, and pottery; dealers' shops swarm with furniture,

public do than exhibit this strong interest in the Artistic fitting up of their homes? They are anxious and willing to have the nearest approach to true Artistic surrounding that lies in their power. What more can we reasonably expect of them? The interest they display may not be tempered with much discrimination or knowledge, but surely it is praiseworthy and deserving of being directed into proper highways, instead of being led into all kinds of so-called "Art" byways and slums, and left to wallow in the mire of commercial "Art." But their willingness only carries them to a certain point. They would like the right thing, but are conscious of the want of knowledge relating to the various subjects which have to be studied before attaining the end they have in view. They naturally cast round for some helping hand, someone to advise and direct them. There is no denying that the trade, in supplying the public's demand for advice, find themselves in a dual and conflicting position, namely, that of adviser and seller, with an inevitable prejudice in favour of the commercial side of the question. Our knowledge of human nature tells us at once, that however conscientious they would like to be in advising the public to buy what they ought to have, they are more likely to advise the public to buy what they, the trade, happen to have to sell. How is a modern house interior evolved? Usually the Architect is called in and plans the building with its several rooms, their structural fittings, such as doors, windows, and mantels. The "Art" decorator then appears upon the scene and carries out a scheme of decoration in accordance with his own predilections, and, more frequently than not, in a manner totally opposed to the structural work of the Architect. The "Art" furnisher and upholsterer proceeds to add his special ideas to the work that has preceded. This, more likely than not, results in an apartment having a Queen Anne mantelpiece, Japanese decoration, and Renaissance furniture. In short, the average modern house interior. I have attempted to demonstrate how the demand of the public is being met and by whom. And now for the crux of the matter. Who ought to supply the public's demand for advice on these questions? Who

ROMAN AMPHITHEATRE, POLA.

credited with being in accordance with that of the seventeenth and eighteenth centuries, both English and foreign. Art meets us at every turn—"Art" stuffs and fabrics, "Art" wall-papers, "Art" furniture. What more can the

by his training, by his unbiassed position, by all the best traditions of his Art, and by the everlasting fitness of things, ought to help the public to obtain the right thing? The answer to such a question is sufficiently obvious. The Architect, as a professional adviser, having no conflicting interests, is free to advise the public not only on Art questions, but also on

\* Extracts from a paper read before the Leeds and Yorkshire Architectural Society.

TRIUMPHAL ARCH, POLA.

the all-important matter of value. The Architect.

#### IN BYE-GONE DAYS,

conceived and regulated not only the building but the whole decorative scheme of the interior, and frequently designed the furniture and minor accessories, whilst in close collaboration with him were the painters, sculptors, and craftsmen, on whom, by his experience of them, he could depend to interpret his ideas; so that, although the work was not accomplished without the aid of many hands, yet the true cohesion and value of the various parts was obtained because the result was the outcome of a preconceived scheme formulated by one ruling mind. Is it not reasonable to suppose that the man who plans the skeleton should best know how to clothe it in a fitting manner, and advise as to its proper aids and accessories? Why, then, does not the Architect more fully evidence his capability, not only to control and design the shell, but to control and direct the internal decoration thereof? Are we to assume that the Architect is, as a matter of fact, able to do this, but that, being a haughty and exclusive person, he only deals with bricks and mortar, and leaves the unimportant question of decoration to the man in the street? Or, are we to be charitable and assume that the Architect is of such a delicate and sensitive nature that he shrinks with diffidence from offering his vast knowledge and experience to the public? I venture to think that neither of these assumptions will commend themselves to reason. The fact remains that the Architect

#### STANDS ALOOF

in silence—anything but a dignified silence—and allows the trade to deal with matters which should be to him the most interesting and important duties of his Profession. And, moreover, his silence is construed by the public into something approaching a tacit acknowledgment of ignorance of the subject. Further than this, the suspicions of the public with regard to the Architect's incapacity are more than negative suspicions. They are frequently confirmed by the difficulties found by the trade in clothing the skeleton left by the Architect, who has designed the same without the slightest regard to an ultimate coherent scheme of decoration

or furnishing. In short the public of to-day are not quite sure of the Architect as a Decorative Artist. The great question then becomes: Are Architects to be content with this, or are they to make every effort to remove what is certainly a

#### STIGMA ON THE PROFESSION,

and restore the confidence of the public in us as Artists? Artists of large heart, large brain, keen sympathy with everything beautiful, and with the great power of bringing all these qualities to bear upon all things connected with our Profession. It behoves the Architect of to-day to cultivate his artistic instincts, and equip himself with the special knowledge which these instincts direct him to search for. The public once satisfied that the Profession is largely contained of well-read, well-equipped men, competent to deal with internal decoration, will be only too willing to employ them. This done, our Art would be restored to the confidence enjoyed in former times, and would become more and more potent in the future. Now, to do all

this, the Architect must be competent to control the whole of the work from commencement to completion. Self-contained, and acting independently of extraneous assistance, he will be strong enough in his knowledge to show both the public and the trade that this question is better understood by him than by others. It is of vital necessity that they be convinced that internal decoration and furniture is an integral part of his business. When, by incessant application, his energies have accomplished control of these things, then, and not until then, will the public respond with confidence. The Architect, in his character as Artist, accepts the duty of demonstrating beauties and truths to and for others whose time and opportunities for the discovery of which are necessarily limited, and, in doing so, exercises his professional acumen, and primarily proceeds to treat with them on a question where they are at least both in touch, namely,

#### THE FINANCIAL QUESTION.

A busy client wishes to build a house, and obtain it at the most reasonable cost. He, of course, instructs that plans, quantities, and specifications be prepared for the structure of the house, obtains tenders, and ultimately gets his building at the lowest market price consistent with his plans and specifications. He compares the figures of the lowest tender with those of the highest, sees that he is saving the difference, and, what is of more importance to us, sees that the commission which he has paid to the Architect for definite plans, specifications, and quantities, has been money well laid out. The question of interior decoration and furniture then confronts him. How in these things is he to spend his money

to the best advantage? He is naturally concerned with considerations of fitness and cost. The practical busy man will gladly employ an Architect, with artistic instincts and judgment, to prepare definite designs and specifications, and invite true competitive tenders for internal decoration and furniture. If I may be allowed to quote my own experience, it is that the preparation of definite designs and specifications by the Architect is not only of the utmost advantage to the client from a financial point of view, but is also welcomed by the several competing firms, who fully appreciate the fact that they are tendering upon a similar basis. Whether altering the interior of an existing house, or building a new one, with a view to ultimate decoration by us, a psychological study of the client should be our first consideration. Every man has an inherited or

#### ACQUIRED IDEAL

of what the atmosphere of his home might be. In some cases this ideal has shaped itself so definitely as to enable the client to express his views in a manner intelligible to the Architect. In other cases this ideal exists unconsciously in the client's mind, and it is here the Architect's duty to probe for and discover his latent ideal of home atmosphere. I hold that a man's home should be, to a great extent, an expression of his own better self—an expression moulded and guided by the hand of an Artist reverent of traditional beauties and truths. If this psychological study of the client be neglected, the probability is that we shall provide him with a house, but fail to give him what he asks from us, namely, a home. The next consideration is the internal economy of the house, having regard to its calibre, the social and family life of the client, the proper relationship of each apartment to its neighbours, the working of all departments. We must, in imagination, pass in and out of every door, ascend and descend the staircases, and pre-apprehend inconvenience that would inevitably come to light when passing through the test of actual occupation. In short, no detail of domestic economy is to be considered beneath the notice of the Architect who intends to plan a house which shall be at once convenient in its arrangement and economic in its working. Our client's assurance of satisfaction with the plans will not relieve us from the future criticism consequent upon the ultimate occupa-

A SHRINE AT POLA.

tion of the house by him; that searching and merciless criticism to which all planning is ultimately subjected. The test, undoubtedly, comes with occupation. Having assured ourselves of the proper organisation of our plan, we can then proceed to consider each individual apartment, and, for its ultimate success, it is indispensable that the complete scheme embracing the disposition of the furniture, decoration, fittings, hangings, carpets, pictures, and accessories should be in our mind. We should have informed ourselves of the nature of all objects which the client may already have in his possession, even though valued for associations' sake alone, and which will have to be reckoned with in the evolution of the scheme. The principal considerations which dominate us are

#### COLOUR AND FORM.

Let me briefly allude to each of these. We give precedence to that all-important subject—colour, that universal source of pleasure, that essential and all-powerful element of Decorative Art. This subject has of late years been investigated to such purpose as to reduce the study of its harmonies and discords to a scientific basis. Colour should be considered before form, in that the wall space is the largest area of the room, and it behoves the colourist, I need hardly say, to select such colouring as will adequately harmonise, complement, or contrast with the subsequently placed pictures, fittings, furniture, and draperies. The size of the apartment, its aspect and use, will govern us as to its particular colour scheme. The colour of the draperies, when the windows are isolated, may complement the wall colour. When windows are grouped together the draperies may harmonise, and thus carry the wall-colour round the room. In constructional work, should hard woods and marbles, which carry their own colour, be used, they may be selected to contrast rather than harmonise with the walls. Should the constructional work be open to colour treatment, a decided complement is desirable. The same order is then followed with regard to form, and whenever any of the materials are already in existence—for instance, pictures, wall coverings, draperies, or furniture, examples should at once be seen. In fact, see as much as possible of that which makes your complete room, and see it in juxtaposition. You may then proceed to settle the form of the remaining items, working through from scale to

#### FULL-SIZED DRAWINGS AND MODELS.

The complete scheme, but as yet only the scheme, having been decided upon, we then prepare the specifications, and arrive finally at the most practical part of our labours, and, I am disposed to think, the most difficult, namely, that of preserving our tenderly nurtured scheme from the rough handling of the unsympathetic workman, by placing its realisation in the hands of the Craftsman having the knowledge and skill requisite to produce the feeling which we wish transferring from drawings or models to the actual work. Those of us who have attempted to obtain this have realised by many a bitter lesson the dearth of such sympathetic co-operation. In conclusion, I say that the remedy rests with the Profession to fix the highest standard of Craftsmanship, and see that it is reached.

MR. FREDERICK BRITTON, contractor and decorator, notifies us of his removal from Leconfield Road to extensive new premises at 469, Caledonian Road, N.

The old hostelry, "The Bee Hive," in North Shields, has been extended and repaired throughout from plans by Mr. G. Scaife French, Architect, Whitby.

A CONFERENCE of master builders of the West of England and South Wales was held in Bristol last week, when a draft scheme was submitted for the formation of a federation. In this connection it may be well to mention that the National Association of Master Builders will meet in Bristol in July, and active arrangements for the visit are now being made by the reception committee.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
April 21st, 1897.

*"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."*—JOHN RUSKIN.

Has the County Council's Works Department saved the London ratepayer any money? It started on the grand Progressive idea that "contractors' profit" was to be saved. Has it been? The important Minority Report of the Special Committee on the recent scandal says plainly, "No." Mr. Beachcroft, Mr. Fletcher, Dr. Longstaff, and Sir G. Lushington, taking the most trustworthy figures brought before them, come to the conclusion that the engineering works have resulted in a saving of £6000 upon a total cost of £130,000. But on the "Architectural works" there has actually been a loss of £10,000 on a total of £220,000. Consequently they recommend that no such "Architectural" works be undertaken for the future, and that the Department be reduced to the level of a sub-office in the Engineer's Department. Here we get to the root of the matter; and it is to be hoped that the Council will not pass over this fundamental question of success or failure, and merely continue the discredited old Works "Committee" under the name of a new "Board."

THE entire reconstruction of King's Cross Station is under consideration. The extremely inconvenient arrangement of this station has long been very prejudicial to the traffic on the line, and though nothing has as yet been definitely decided on, the probability is that as great an improvement will be effected at King's Cross as that which has now been practically completed at Moorgate Street. Great changes in many ways have taken place since this important station was planned, and it has become quite out of date and wholly inadequate to the traffic. It will be troublesome and expensive work to carry out so extensive a reconstruction with many hundreds of trains rushing in and out of the station all day long, but it will hardly be more serious an undertaking than Moorgate Street, and sooner or later it will have to be done. Mr. Sherrin, the company's Architect, has prepared plans and constructed a model for the consideration of the directors, and it is expected that in the course of the next week or two their decision will be arrived at.

MR. ARTHUR WHITCOMBE, Surveyor, of 5, Newman Street, W., gives some interesting facts as to the condition of the floor and wall supports of some houses in London. He says: "The attention of householders along the line of route of the Jubilee procession in June who propose to utilise their windows for the accommodation of many spectators, should be specially directed to the condition of the brick piers or other main supports of the front walls in the basements. In my experience as an Architect and Surveyor, I have frequently found these piers in a very bad condition, and often dangerous. I know of many such piers—I am not alluding to the line of route—at the present time which would, in all probability, give way if the floors above had an undue number of people packed upon them along the front wall. The danger is increased when, as is often the case in the older houses, the joists of

the various floors are laid from the two party walls to a beam running across the centre of each front room, from back to front, and concentrating weight upon the centre pier. Where there are shop fronts, too, the weight of the upper part is concentrated frequently on a column, stanchion, or story-post, and from thence conveyed to a pier in the basement, which is often in an unsafe condition, to say nothing of the condition of the story-posts themselves. The district surveyors will, no doubt, keep a sharp eye on the erection of temporary structures, but householders who propose to use their shops, rooms, and balconies, should satisfy themselves as to the front wall supports in the basements."

LORD WOLSELEY insists on the burnt-out wing of Chelsea Barracks being rebuilt before the end of May. It can be done, of course, for nothing seems impossible to the London builder of to-day. With electric light by night, and with steam cranes and things, he can go on joining bricks and mortar for the whole twenty-four hours with a rapidity that would seem impossible to the bricklayer of one's boyhood. The Indian contingent are to be lodged in the new wing. To have them in a brand new building will be a distinct advantage. It will gratify the religious susceptibilities of many of them, because a building that has not been used cannot have been defiled.

THE French Architects are up in arms at the approaching demolition of one of the most ancient edifices in Paris, namely, the Church of St. Pierre de Montmartre. It is not given to every foreigner who visits Paris to journey up to that quarter, especially by day; but this is hardly necessary, for the stupendous scaffolding of the huge Church of Sacré Cœur arrests the attention from some part of every quarter of the city. It is through this erection that the old Church has fallen into disuse, disrepute, and neglect, and its removal decided upon. The Church was erected by Louis-le-Gros on the site of the martyrdom of St. Denis, and its finest portion, the choir, was consecrated in 1147. It is one of the three Churches only remaining which mark the transition between the Romanesque and Gothic styles.

A WORKING men's committee of the Conservative Association in Liverpool recently met to consider a resolution passed by the branch in favour of a proposed Bill facilitating purchase by working men of their own dwellings. It was resolved to impress upon the Government the desirability of promoting legislation with this object. During the proceedings it was stated that a letter had been received from Mr. Chamberlain, who reiterated his views favourable to this question. He said he had not changed his opinions, but owing to the limited time at the disposal of the Government, and with a very active Opposition in Parliament, it was impossible to do everything at once. He hoped, however, before the Government left office they would be enabled to make progress with the measure and with other social reforms. With the exception of one speaker, who said there was no working man in ordinary circumstances who could afford to live in a house of his own, the general opinion was that the possession of property by working men would draw them towards Conservatism, and that was one of the reasons why the Radical party would not extend their support to such measures.

IN front of St. Martin's Church, Trafalgar Square, the pavement is only 5ft. 6in. broad, and the Vestry wants the County Council to widen it to 9ft. by getting rid of the terrace between the two flights of steps leading to the edifice. The Society for the Protection of Ancient Buildings is strongly opposed to the proposal, and so is the Council's Improvements Committee, which thinks that if anything be done it should be the widening of the carriage way. These schemes would involve alteration in the appearance of the Church. So, the Committee has concluded, there is nothing for it but more police control over the omnibuses.

A correspondent writes:—"Some of the employers in the building trade are getting restive under the agreement which has been in force in most places throughout the kingdom for some years, to the effect that when any alteration of wages or conditions of work is desired by either side, six months' notice, terminating on April 1st, should be given. Employers allege that this gives the workmen an unfair advantage, inasmuch as it only enables them to seek a change at the commencement of the busy season. As a matter of fact, the activity or otherwise of the building trade is always measured by the work done in the six or eight months commencing with the spring, and if employers were allowed to give notices of changes terminating in the latter part of the year, they would almost always have the excuse that trade was bad, and that it was necessary some concession should be made them in order to keep things going. Knowing that the trade is measured up by what goes on apart from the winter months, and that contracts are practically made or arranged early in the year, there seems to me to be nothing unfair in compelling the employers to go on with the conditions of work and wages under which their contracts are made. At any rate, the men are kicking against any change, and it is more than probable that they will do so successfully."

"WILL you kindly allow me to appeal through your columns," writes the Vicar of Shoreditch, "for the mother Church of one of the oldest parishes in London? There has been a Church of St. Leonard, Shoreditch, on the same site since Saxon times, and the present building, designed by Dance, a pupil of Wren, and dating from 1740, has fallen sadly into disrepair and needs immediate restoration. Many Londoners are familiar with the graceful spire, surmounting a small dome, which forms a landmark at the junction of four great thoroughfares—Old Street, Kingsland Road, Shoreditch, and Hackney Road; and this spire, the glory of the whole building, is in so dilapidated a condition that already the workmen have begun upon it without waiting for the rest of the work. Queen Elizabeth herself, when starting on one of her progresses, heard and praised the "Bells of Shoreditch," so famous in nursery lore. A century later we find this Church, under its active and heroic vicar, John Squire, a stronghold of resistance to Puritan innovations, and the present building still preserves the rich Flemish east window which excited Puritan iconoclasm—yet all in vain, for Squire had the wit to bury the glass in safety. One more century, and we see our present fabric causing the first recorded strike in the building trade, which led to so serious a riot that Horace Walpole drew attention to it in Parliament. Will any of your readers help us to raise the £2000 necessary for thorough restoration?"

An article in a foreign contemporary gives some interesting particulars as to the enormous sums which patriotic Greek millionaires have lavished upon their native land, and more especially upon Athens, its capital. Scarcely a hospital, a library, a school, a theatre, or a university would exist were it not for the generosity of these benefactors. The very channels and kerbstones of marble are a gift from private purses. In short the munificence of individuals provides for every public need except the interest on the National Debt. Within the last few years it would be easy to reckon up gifts to the amount of a million sterling. Baron Simon Sina, of Vienna, spent two and a half millions of drachma on the Academy, and Baron Georgius Sina endowed the city with an Observatory. The Rallis rebuilt the Archbishop's Palace, and contributed £250,000 towards the erection of a theatre. Nobody knows at what cost M. Georgius Averow, of Alexandria, has revived the ancient Stadium in all its pristine glory. Benardakis, Zaffropoulos, Papadakis, Stilizzis, and a score of other names figure in the scroll of fame. Nor should it be forgotten that all the wealth thus showered upon their fatherland has been acquired outside its borders,

hardly a drachma of it having been wrung from the soil of Hellas.

PROFESSOR HERKOMER, R.A., lecturing at Newport on "The Art Life," said the word "Art" was a very wide term, but all Artists loved their work, and loved to talk about it. Students some years ago were in a much worse condition than they are nowadays, and Artistic life was then looked upon as a sort of brigandage. The great evil of an Artist's life was the loneliness in which he had to live before fortune came. A strange feature of a young Artist was that, however original he might be, he would copy contemporaries, but the great and momentous question of his life was the subject for his Academy picture. He spoke of the painting of his picture—his second big one—the "Chelsea Pensioners at Church." That task was entered upon against the advice of all his friends, and when it was finished no one could have had more trepidation than he when it was sent to the Academy. It was executed at a time of great domestic bereavement. He expected at every post to get a letter of rejection, but after five days he got two letters—one from Lord (then Mr.) Leighton, whom he did not know, and one from Mr. George Richmond, stating that his picture was accepted, and that when it was taken before the committee they all clapped their hands.

At the corner of Newhall Street and Edmund Street, Birmingham, quite an ornate building has been erected for the purpose of the new exchange of the National Telephone Company. The site has an area of about 830 square yards, having a frontage of about thirty-five yards to Edmund Street and about twenty-five to Newhall Street. The building is one of four stories—namely, basement, ground floor, and first and second floors. It is designed in what for want of a better term may be called modern Renaissance, and executed in Ruabon red brick and terra-cotta. This material has been chosen in preference to stone in view of the circumstance that the building is largely in the shade, and the red colour gives an effect of light which, in such a situation, stone would not possess. The façade is divided by bold piers, with highly decorative treatment of the upper portion, which consists of arches and gables ornamented with a profusion of moulded terra cotta. A number of the windows, including those at the corner, stand forward as bold bays from a deeply arched recess, and are set off with terra-cotta balustrades. The upper portions of the piers are embellished with a flat fretwork design in sunk panels, which contrasts with the high relief floral embellishments of the arches and spandrels. At the top of the façade there is an open balustrade of terra-cotta, broken by the gables and by small pinnacles. Some of the principal gables are decorated with large floral medallions, and are surmounted by an open tracery, while others are pierced by the chimneys, which, owing to the internal arrangements, were required to be carried up the outer walls of the structure. The chimneys have, therefore, been made a portion of the decorative scheme. The main entrance to the building is through a wide arched doorway in Newhall Street, for which elaborate wrought-iron gates are being prepared by Messrs. Brawn and Co. The Telephone Company proposes to let off the ground floor, where there are eight rooms suitable for offices, and a group of four rooms with separate entrance in Newhall Street. There are also six rooms which are proposed to be let as offices upon the first floor. The remainder of the building the company retains for its own use. In the basement are the apartments of the office-keeper, and eight rooms allotted to the local manager's staff. Upon the first floor the provincial superintendent and the district manager will have their offices, while the second floor is chiefly devoted to the largest apartment in the building—the actual "exchange" or switch-room. A portion of this will, to commence with, be partitioned off as dining and recreation-rooms for the girls employed at the Exchange; but these, when necessity arises, can be readily absorbed, so as to increase the length of the

switch-room from about 68ft. to 95ft. The apartment has a width of 40ft., and will accommodate about 200 operators. The building has been designed by Messrs. Martin and Chamberlain, and has been carried out by Mr. Thomas Rowbotham, builder.

An Exhibition which must appeal to all Art lovers is that of pictures, water-colour drawings, and etchings by Mr. Alphonse Legros, collected in Mr. E. J. Van Wisselingh's little gallery, in Brook Street, Hanover Square. Professor Legros, for inspiration, has chosen old masters, and the most robust and earnest of his own countrymen, and for draughtsmanship and dignity of style he reveals his own individuality in a forcible manner of expression which seems to dominate the subject. But, unlike the opposite school, that of the "impressionists," Mr. Legros aims at directness and simplicity. The most finished picture here, "Femmes en Prière," which has been purchased by subscription for the National Gallery, will be remembered by those who visited the first exhibition at the New Gallery. Some of the lesser figure studies, showing what a variety of tools—pencil, brush, silver-point, and the etcher's needle—the Artist can command, are masterly examples of expressive lines and modelling, and even in the solemn allegories of death, the skeleton is not a merely visionary presence. The landscapes are mostly restful and impressive, and are invested with imagination even when the materials of composition are of the humblest kind. For portraiture, Mr. Legros is, perhaps, almost more famous with the general frequenter of galleries than for the different other forms of his genius so well displayed on this occasion.

"THE Monasteries of Essex" was the title of a most interesting lecture recently delivered at the Lecture Hall, Ipswich, by Mr. Geo. Biddell. Thirteen monasteries and priories were dealt with out of the total of forty-seven which at one time existed in the county. Taking the once famous Waltham Abbey, a small portion of which still remains, Mr. Biddell told of the original foundation and endowment. At the time of the conquest the Abbey was very rich in lands, receiving the revenues of nearly four thousand acres. The Abbey was re-endowed by Henry II. as a kind of act of penance for the murder of Thomas à Becket. Barking Abbey was the oldest, having been founded by Erhenwald in 670. A fine view was thrown upon the screen of the existing Abbey "curfew" tower, which forms the entrance to the parish churchyard. The historical Bow Bridge, built by Queen Matilda, was once kept in repair by Barking Abbey, in conjunction with Stratford Langthorne. Of the latter, only a few stones were now left, but it was originally a very large Abbey, founded about the twelfth century. Some excellent views were given of the remains of Leighs Priory, now occupied as a private house. The Priory was founded in the twelfth century—a great Church building age—and after the dissolution, fell into the hands of Lord Rich, one of the king's favourites. Blackmore Priory was amongst the forty-one small Priories which Henry handed over to Cardinal Wolsey, who expended the money received from them in founding his famous colleges at Oxford and Ipswich. Dunmow Monastery was founded by Ralph Bagnard in 1350, and in the existing Priory Church is the chair in which sat the candidates for the time-honoured fitches of bacon. Coggeshall Abbey was once a very large establishment, originally inhabited by Cistercian monks. One portion of the old Abbey now formed a farmhouse, whilst other parts—once beautiful places—were utilised as cart-shed, granary, and fowl-houses. St. Botolph's, Colchester, which was first taken over by Augustinian Monks in 1107, was in 1648 ruined during the siege. St. John's, Colchester (founded by Eudo Dapifer in 1096), was perhaps in the past the most important Abbey in Essex. It was one of the few mitred Abbeys of the country, and was privileged also in many other ways. Several photographic views of the ruins of St. Oystin's Abbey the largest in Essex—were given. The Abbey was founded by Bishop de Belmeis in

1118, scores of wonderful legends being bound up in its history.

In a recent issue of the British Medical Journal attention was drawn to "Lead Poisoning and Employers' Liability" in Germany. The death of a boy, aged 13 years, from acute plumbism, in the potteries, has, says the same journal, supplied the opportunity to the daily Press for again dilating upon the extremely dangerous nature of a trade which kills in four months' time. The lad, never very robust, was employed as a "dipper" in a pottery, and while going to the factory was suddenly seized with a convulsive fit, in one of which he died. Other signs of lead poisoning were present, such as wrist-drop and a blue line on the gums. At the inquest the coroner described as death-traps the dipping houses of potteries in which children of tender years were allowed to work. It has again and again been shown how rapidly young people succumb to the harmful influences of lead, and how desirable it is that the age of workers in such trades should be raised, and only those allowed to labour therein who are healthy, cleanly, and well fed. Raising the age alone is not sufficient. The question of lead poisoning was carefully investigated some time ago by a Home Office Committee, and their report was published. The large number of deaths from plumbism within the last few months is the strongest proof for the necessity of the action taken by the late and the present Home Secretary, and ought to strengthen the hands of Sir M. W. Ridley in carrying out the recommendations embodied in that report, and those made by the Potteries Committee. It is not creditable to any industry that death should follow after four months' exposure, and employers should lose no time in placing those whose circumstances oblige them to labour in such an occupation, beyond all possible risk to health and life.

THE monument which is to be erected to the memory of Pasteur, at Lille, is in process of execution by the Sculptor, M. Cordonnier. The work is to be placed in the Place Philippe le Bon, and is truly realistic. The monument consists of the female figure of Science, with a baby in her lap, whilst the unfortunate child is being inoculated with hydrophobic virus by its scientific nurse. The inauguration of the monument is expected to take place in a year's time.

THE Society for the Protection of Ancient Buildings has forwarded a letter to the Scarborough Town Council, with reference to the construction of the Marine Drive, stating that the Society hoped the Town Council would use every endeavour to preserve intact the old town on the slopes of the Castle Hill and bordering on the old quay, more especially such houses as that known as the "King's Residence," the house where Richard III. is reputed to have lodged in 1484, as these were valuable as forming part of the history of Scarborough.

ONE of the most remarkable pieces of Sculpture at the Royal Academy will be the statue of Dame Alice Owen, by Mr. Frampton, A.R.A. This well-known benefactress to the charities of Islington, Oxford, and Cambridge has been portrayed, after an old picture, standing in ruffe, bodice, and embroidered dress, with a Bible in one hand and a crook in the other. Whilst the head, ruffe, and hands are in coloured marble, the rest is in bronze. The effigy of this good Elizabethan lady is destined to stand in the hall of the almshouses at Islington, where it will go down to posterity as one of the most notable examples of the revival of Sculpture in the Victorian era.

ALL those to whom the public parks are not only so many healthful breathing spaces, but are regarded with delight from a floral and Artistic standpoint, will be interested in learning that, in consequence of the approaching Royal celebration, alterations and improvements on an elaborate scale are being made in their favourite West End resorts; and there can be no doubt that the pleasures of the metropolis will, during the coming summer,

appeal more to the eye and the sense of the beautiful than they have done in any previous year. St. James's Park, though nearer than any of the others to the turmoil and throbbing life of the City, is unquestionably one of the most sylvan and picturesque that London possesses, and here extensive improvements are projected, so that ere long there will be few more delightful promenades than the one which furnishes so agreeable a prospect from the front windows of Buckingham Palace. In Hyde Park embellishments on a similarly extensive scale are being carried on, and when the season is at its height the road which skirts Park Lane, as well as most of the favourite walks and drives, will present a most inviting appearance.

In the course of the excavations on the site in Duncombe Place, York, upon which the new dispensary building will shortly be erected, the workmen uncovered an interesting relic in the shape of a cock-pit. The ancient sport of cock-fighting was carried on behind the "Shakespeare Tavern," a very noted house, which formerly stood in Little Blake Street, and the cock-pit recently unearthed is doubtless that which was attached to the "Shakespeare Tavern." The pit, with its appurtenances and accommodation for spectators, was found to be in a fairly good state of preservation. The arena was found to be about six feet square.

THE efforts that were being made to save the Doddington pele tower have, unfortunately, been foiled by the winds, the whole of the east end of the edifice having recently come down with a crash during a storm. The news, announced by the Newcastle Society of Antiquaries, will be received with regret by all who feel an interest in the preservation of these relics of the stormy border life during the Middle Ages. Doddington is a quaint and interesting little place, and many relics of the past have been discovered at or near it. On the hill overlooking the village, Doddington Law, are the remains of a camp, while several stone implements (of porphyrite) or celts, have been found there, the sole memorials in the neighbourhood of neolithic man. The pele towers, of which that of Doddington was a good example, were erected in considerable numbers by the Northumbrian landowners during the fourteenth and following centuries as a defence against the plundering raids of the Scots.

AN important re-arrangement of the tablets exhibited in the Kouyougik Gallery has recently taken place. Up to within a short time ago the clay documents discovered on the site of Nineveh were practically in a state of confusion, and visitors wishing to see any particular class of tablets had to search for them as best he could. This difficulty has, however, now entirely disappeared. The Gallery itself has, in fact, been re-christened, for, instead of being known as the Kouyougik Gallery, it is now known as the Nineveh Gallery. The tablets have been arranged in nine table cases in the centre of the Gallery, labelled respectively A, B, C, &c. In Case A may be seen the famous tablets relating to the Creation and Deluge, the latter having a large label attached describing as minutely as possible the Chaldean legend of the great flood. The same has been done with the Creation tablets, as well as the inscription giving an account of the descent of Ishtar into the under-world. In Case E are arranged the letters from private and public individuals to the King, concerning a large variety of subjects. In the same case, also, are arranged some contract tablets, showing the different styles of handwriting in use at different periods. The wall sculptures from the Palace of Assur-bani-pal have not been altered, so that the Gallery at first sight does not appear to have undergone such a radical change as has really been the case.

THE handsome new drinking fountain at Mentone, which has been presented to the town by Mr. Thomas Hanbury, was inaugurated on the 10th inst. The fountain—named "Fontaine de la Frontière"—is an imposing

structure, of finely carved Turbia stone, and stands at the junction of the Cornice Road and the Promenade St. Louis, a quarter of a mile from the bridge of that name, which marks the boundary between France and Italy. The fountain bears the following inscription in English:—"In commemoration of the 60th year of the reign of Her Britannic Majesty Victoria, R.I., and in recollection of her stay at Mentone, 1882." The Architect is Mr. W. D. Caroe, of Whitehall Place.

THERE will be few lovers of the beautiful found among the mourners assisting at the obsequies of Vauxhall Bridge when the time comes for its removal; but though not "a thing of beauty" (especially at low tide), the bridge is not without its interesting points, and will be chiefly lamented by the remnant of the past generation who see gradually, but surely, the snapping of the links which join the earlier part of this century to the latter. Vauxhall Bridge is not old, but it is one of the last survivors of gay Vauxhall. It was the direct route from the fashionable quarter (Belgravia, Hyde Park, and Mayfair) to the fashionable pleasure grounds, Vauxhall Gardens. The Bill for the erection of the bridge passed through Parliament in 1809, and building operations were commenced in 1811, when the first stone was laid on the Surrey side by Lord Dundas (representing the Prince Regent). Two years later the first stone on the Middlesex shore was laid by Prince Charles of Brunswick, and the bridge was opened for traffic in the autumn of 1816. The bridge, which was designed by Mr. J. Walker, and cost £300,000, consists of nine iron arches, supported on stone pillars. The tides have so seriously affected the foundations of the bridge that it is now condemned as unsafe, and as soon as the temporary bridge is built (unless it should fall before) it will be demolished.

AN artistic record of the monuments and statuary in St. George's Chapel, Windsor, the Royal Mausoleums, Frogmore, the Albert Memorial Chapel, Windsor, and the Prince Henry of Battenberg Memorial Chapel, Whippingham, is in course of preparation. The work has been undertaken by Mr. Murray Fisher. To emphasise the importance and unique character of this work, it is essential to mention that admittance to the Royal Mausoleums at Frogmore is only to be obtained by a direct order from Her Majesty. These exquisite works of Art are, indeed, only to be seen by an order from the Lord Chamberlain on the anniversary of the Prince Consort's death, and this privilege is extended only to the inhabitants of Windsor and neighbourhood and their friends, and then only for two hours. It is obvious, therefore, that this work will be a valuable public record of these most interesting and beautifully artistic Royal monuments, and the only available means of obtaining any idea of the magnificently rich and elaborate works of Art contained in these memorials of the illustrious dead.

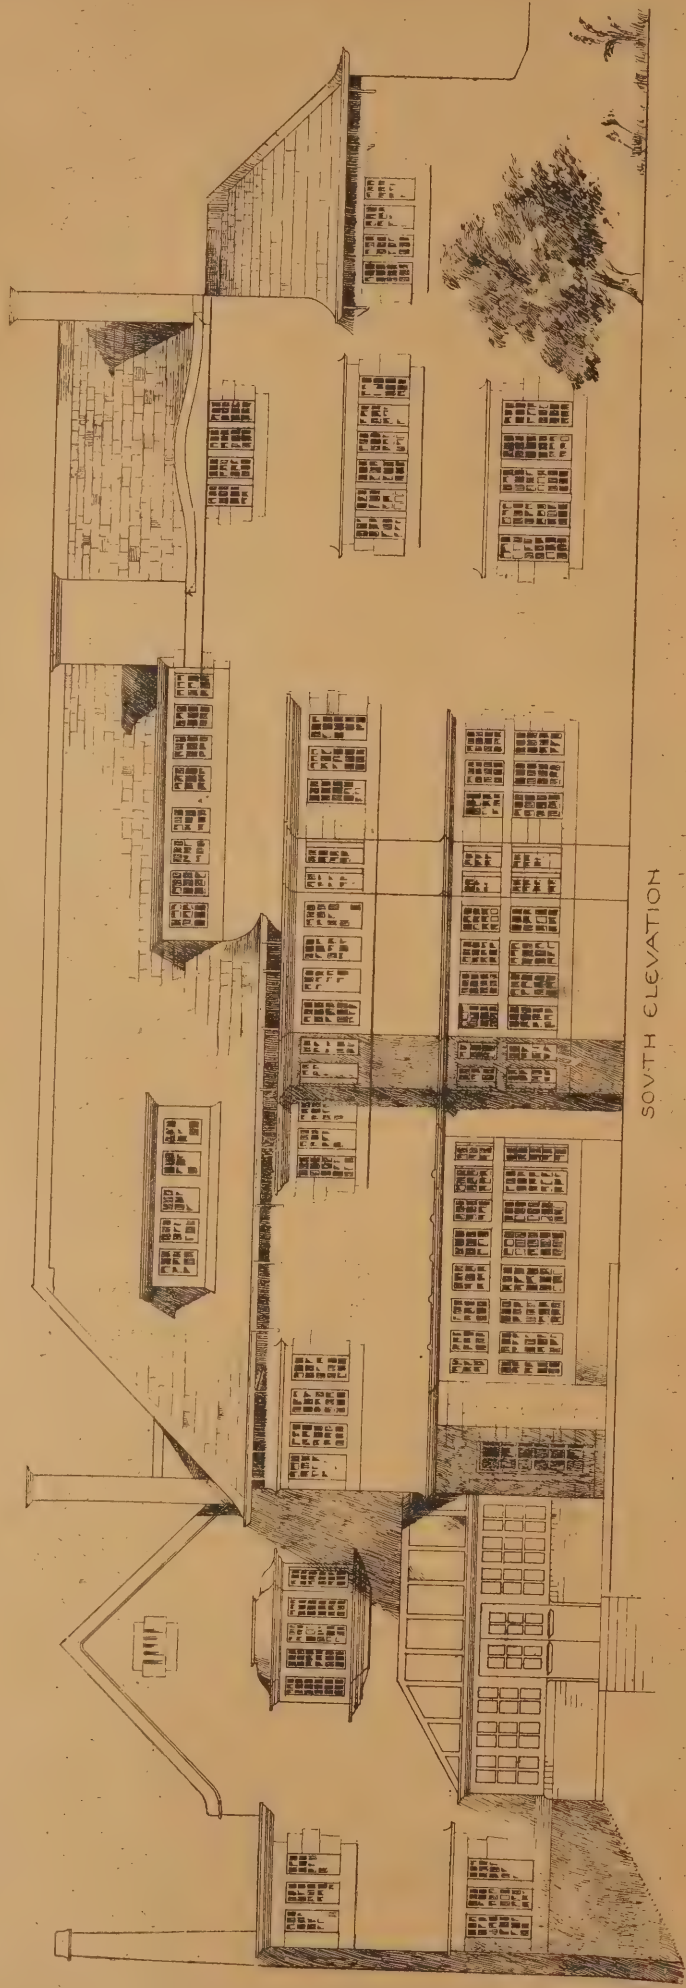

MR. D'EYNCOURT gave his decision last week in a case in which the London County Council summoned a local publican for having a trade sign fixed in contravention of the Building Act. The words of the section upon which Mr. Chilvers (who appeared for the London County Council) relied were that the sign was more than 3ft. above the parapet of the house; but Mr. Ogle (counsel for the defendant) submitted that it was not 3ft. above the wall to which it was fixed. Indeed, it was several feet lower. The case of the sky sign at the Savoy Hotel was quoted; but it was answered that this sign was fixed to the chimneys, which in the opinion of the magistrate was not a wall within the meaning of the Act of Parliament. Mr. D'Eyncourt, in giving judgment for the defendant, said he had infinite sympathy with any attempt to put down in every sense of the word those hideous signs which obstructed the light over the tops of the houses. He, however, was bound to find as a fact that the sign in question was not above the walls to which it was fixed, either with regard to the public-house wall or the house adjoining. The summons was dismissed.

# THE ORIGIN AND DEVELOPMENT OF RENAISSANCE ARCHITECTURE IN ITALY.

By C. B. HUTCHINSON, A.R.I.B.A.

THIS subject applies to literature, painting, and sculpture, as well as to Architecture. Roman Art is an amalgamation of Etruscan and Greek forms, adapted and moulded to their national characteristics, and developed during Imperial times. The boast of Augustus Caesar was, that he found Rome of brick, and left it in marble, and it is from this period that all their most celebrated buildings date. The only two buildings of this time which are preserved and still used at the present day, are the Pantheon, or Rotunda, and the Church of S. M. Degli Angeli, which was part of the Baths of Diocletian. But the vastness of their ideas is shown by such structures as the Baths of Caracalla and the Coliseum, and their far-reaching power by the wonderful ruins of such distant colonies as Baalbeck and Palmyra, and their inexhaustible energy by the immense size of the stones used here, some single blocks measuring 63 ft. in length, and weighing 1100 tons. But their wealth caused them to become luxurious, they lost their muscular energy and strength, the Gothic hordes poured down from the North, gradually fought their way and eventually conquered, causing desolation and ruin. The dark days which followed lasted for about seven centuries. Roman Art and history were as forgotten as Herculaneum and Pompeii, their literature was not understood, and the Greek language was hardly known. It is strange how often facts are known but not understood, and their use little realised. The meaning of Egyptian hieroglyphics is a modern discovery, and Assyrian cuneiform inscriptions were very recently deciphered through the energy of Rawlinson and Layard, which has now enabled the history of these two nations to be fully known. The Babylonians 3000 years B.C. used cylindrical seals of quartz, jasper, and lapis lazuli, engraved with quaint devices and inscriptions which were rolled over clay tablets to leave their impression, and yet it was left to John of Gottenberg in the middle of the fifteenth century to take this one step farther and develop printing. The Italians were quite ignorant of their past history. The remains of ancient buildings around them were looked upon as picturesque objects, but they knew little more about them than we do of the ruined cities of Mashedan, or the Arabs did of the contents of the desolate mounds of Nineveh. But at last, in the early fourteenth century, the Italians woke up to a knowledge of Roman authors and Roman history, developed by Dante and his contemporaries, followed shortly afterwards by the revival of the knowledge of Greek literature by Petrarch and Boccaccio, and the influence of Greek Art upon the Romans. The Italians then began to realise their past history and the grandeur of Roman Imperial times, just as the excavation of Pompeii opened to our eyes the houses and public buildings of this Romano-Greek city as it was left when suddenly buried under the ashes of Vesuvius, or as the excavations of Nimroud and Khorsabad, by Layard and Botta, showed us in its sculptured walls the daily life of that great, but warlike and cruel, nation, the Assyrians. So did the Italians now understand the greatness and magnificence of the Romans and their conquest in all parts of the world as illustrated by such sculptures as those seen in Trajan's Column, or the Arch of Titus in Rome. It kindled an enthusiasm to become again what their ancestors were in former ages, and gave this wonderful stimulus to literature and the Arts of Architecture, Painting, and Sculpture, based upon a real study of Classic precedent, which we now call the Renaissance. Roman buildings and Roman sculpture and detail is now copied in every new structure, to the entire exclusion of their former Byzantine and Romanesque style. This began in Florence and Rome, gradually extending northwards, pouring a flood of Classic detail and Classic design all over Europe, and altering the whole character of Architecture in each country.

Up to this period each nation had its own indigenous type of Architecture, just as it had its own language and its own religion. The buildings of Egypt, Assyria, Greece, and Rome are all distinct from each other, as is also the Celtic work of Northern Europe and its later development into Gothic Architecture; or again, the complicated detail of Indian and Saracenic buildings. Each is the natural growth of national sentiment and religion adapted to the requirements of a nation, and each is peculiar to its own country. There were developments of these primary forms, such as the Egyptian into Assyrian and Persian, with its later forms of Sassanian, Saracenic, and Moorish. Nearer home we find Celtic mysticism developing into the impressive beauty of our own Gothic Cathedrals and Abbeys. Each country has its own

## NATIONAL ARCHITECTURE.

either of a primeval form or else blended with influence due to the conquest of, or commerce with, another nation; or local peculiarities due to the settlements of foreigners, such as the Byzantine characteristics so noticeable in Venice, due to its trade with the East. Or, again, the dome district in the South of France, especially at Perigieux and Angoulême; or the Flemish carved work and brasses found in Norfolk and Suffolk. But Renaissance Architecture is a reverting to and copying of Roman Classic buildings, and adapting the general design and proportions and all the carved details to their Mediaeval requirements. Corinthian columns, capitals, and entablatures are now found all over Italy, to the entire exclusion of the Byzantine and Romanesque types, and afterwards gained a firm footing in every country in Europe. Renaissance Architecture becomes everywhere the recognised form of Design, entirely supplanting its Gothic predecessor—starting in Florence and Rome, working northwards, spreading all over France. In Spain the expulsion of the Moors from Granada and the great influx of wealth due to the conquest of Mexico and Peru, together with the strong religious fellow-feeling between that country and Rome, enabled Roman Architecture to gain a firm footing. In England Renaissance Architecture was not adopted for nearly two centuries after it was in Italy. But the new style was soon taken up and used for every new structure, whether Church or public building or private house, even the silver candlesticks on the overmantel being probably a copy of Trajan's column. It is a strange fact that up to the time of the Renaissance no building in any country was a copy of another building in any other country, or of a building of a previous date in the same country. For instance, an Early English Architect would never think of adding to a Norman building in any other style but that of his own time, nor would he design a Byzantine Church or a Roman portico. In fact, Ferguson's opinion is that it would not be far wrong to say that every building in Europe erected previous to the commencement of the Renaissance, was indigenous as regards its design, distinct according to the country in which it was erected, whereas every building dating subsequent to this period is more or less a copy of a previous Classic one in general design and in detail, and in most cases with no association of race or religion. The Renaissance began with simplicity of form and purity of detail, after then Sculpture was used to a lavish profusion, but it was good, as is shown by the façade of the Certosa at Pavia, but its later stages were characterised by unmeaning and ill-considered detail filling up every available space in a Design such as is often seen both in Italy and Belgium; this style is often called "rococo," it was chiefly carried out at the time of Boromini and Bernini in the latter half of the seventeenth century, and was the last phase of Renaissance forms. It will be, however, necessary to retrace our steps for a short distance, and consider how the Italian commenced this new style of Renaissance Architecture. The first great pioneer of the Renaissance was Brunelleschi, 1377-1444. No doubt the way had to a certain extent been prepared for him. Niccola Pisano, a century and a half previous, had freed Sculpture from

the conventionality of Byzantine forms and revived true Roman types. Cimabue, who was thirty-five years younger than Pisano, had struck out the same individuality of thought in painting, and Giotto, who was thirty years younger than Cimabue, had built the beautiful campanile to the Cathedral S. M. del Fiore at Florence; but still Architecture was on the former traditional Gothic lines, and Brunelleschi was the first to initiate the Roman Classic revival. Vasari, in his useful book of the lives of Italian Artists, relates how Brunelleschi and Donatello, the Sculptor went to Rome, and studied the old buildings, which, it should be borne in mind, were much more complete, and far more beautiful, than they are now. Pirenesi's etchings give some idea of what they were like, covered with foliage and wild flowers, and most picturesque, very different to what they are at the present day, bereft of every plant and leaf. The marble carved work and columns were taken away and used up in new buildings. In the fifteenth century the Baths of Caracalla, we know, had their columns and marble work remaining, and in later times some of the marble was burnt for lime, as was the case in Greece and Asia Minor. Vasari describes how

## BRUNELLESCHI AND DONATELLO.

on arriving at Rome, were astounded with the magnificence and perfection of the buildings. They set to work measuring all the plans, cornices, &c., and did not fail to take the measurements of any good thing within their reach. Brunelleschi, especially, pondered over the construction of the Rotunda (Pantheon) and considered the means by which it was erected. He also examined and measured all the vaults of antiquity he could, taking note of the means of uniting the stones, the equilibrium and close conjunction of all the parts. These two men were full of enthusiasm for their work, and neglected even their meals to get their drawings finished; but the people in Rome could not quite understand what they were doing, and called them the "treasure seekers." The book on Architecture written by Vitruvius, who lived at the time of Augustus Caesar, and to whom it was dedicated, was of great use, as in it are laid down all the fundamental rules for Classic Architecture and the proportions of buildings, both as a whole and in each detail. This was closely studied, and was especially valuable as being based on preceding Greek authors, whose works have been lost. This is shown by the number of Greek words used to express certain ideas. Alberti, who was somewhat younger than Brunelleschi, wrote his great work entitled "De re Aedificatoria," which is almost entirely based on Vitruvius, and greatly aided the revival of the true principles of Classic design, and so set the Renaissance on the right lines. Up to this time designs were of Byzantine form, due to the transference of the capital by Constantine in the fourth century, or Romanesque, which is a blend of the Eastern Byzantine and Northern Gothic. The type of Architecture in various cities differs according to the influence from each source, such as we see at Venice, Ravenna, Florence, or Rome. Gothic feeling diminishes according to the distance from its original home. At Venice it is strong, at Florence the Etruscan element was still perceptible, and so prevented Gothic feeling from taking any real root, though a few beautiful examples exist, such as Giotto's campanile to the Cathedral; while at Rome this feeling is hardly perceptible, the Classic traditions being too strong to allow it to take any hold. In fact Byzantine and Romanesque buildings possessed a certain picturesqueness, and in the former type colour played a prominent part, such as is so noticeable at Venice and Ravenna, produced to a great extent by mosaics, but also by a variety of coloured materials and marbles. The carving was always conventional, and had some beauty of its own, but it is not of a pure form. The acanthus leaf and Ionic volutes are still seen, but all the detail shows a want of study, especially of form. The figures are ill-proportioned and badly posed, the features have no anatomy or expression, and the drapery

is merely a series of straight or curved lines, intended to represent robes or vestments. The subjects for carving are within a limited range, and usually illustrate elementary Biblical truths. It should be borne in mind, however, that before the invention of printing, Sculpture was one of the few means the Church possessed of illustrating the facts of Christian doctrine. After then, when knowledge could so easily be spread, and people could read the Scriptures for themselves, the subjects chosen for Sculpture were much more varied. At the Renaissance, however, there is a most complete change. Sculpture is based on Classic examples: the human figure, with its proportion and anatomy, is carefully studied, the same care being taken with drapery and such like accessories. As already stated,

NICOLA PISANO

had struck out this new line in a masterly manner, one of the best examples of his work being the pulpit at Sienna, finished in 1266. Classic Architecture is analysed and rigidly followed, with its definite rules and proportions as laid down by Vitruvius, with its massive columns and entablatures, according to its "orders." An "order," it should be remembered, consists of a "column," sub-divided into base, shaft, and capital; and the "entablature," sub-divided into architrave, frieze, and cornice, with or without a pediment. The orders are Doric, Ionic, Corinthian, and Composite, and may be compared to our Gothic periods of Norman, Early English, Decorated, and Perpendicular. The most apparent difference between Classic and Gothic is that in the former all the leading lines are horizontal, and in the latter they are vertical. It will be well to consider now why it was that Renaissance Architecture emanated from Italy, and what were the reasons underlying such conspicuous success. These arrange themselves under four heads. Firstly, the Italians had all around them the ruins of the Roman Empire, and so could see every day the very spots where historic scenes had occurred. There, on the slope of the Palatine, were the remains of the palaces of the Cæsars, with the Forum itself just below, and the triumphal arches, with their sculptures, records of distant victories, and Trajan's column, illustrating his wars, just as the Bayeux tapestry did the progress of William of Normandy in conquering Harold, also Egyptian obelisks in different parts of Rome, as trophies of the subjugation of that country. The Architectural remains formed abundant food for study for Architects, as did the wonderful Sculpture for men like Donatello; the Vatican collection showing the perfection that was reached in such masterpieces as the Apollo, Belvedere, the Nile god, or the Laocoon. Secondly, the Italians were fortunate in possessing a continuous series of Architects, Painters, and Sculptors, all either working together or else in certain parallel schools, each generation working on the lines of its predecessors, but gradually eliminating any defects and perfecting the forms and aims of each, thus forming a consecutive evolution. In Architecture we have Brunelleschi, Alberti, and Bramante as the three great pioneers, striking out an entirely new line, and each in his own peculiar way, though in the same direction. In Sculpture, Nicola Pisano leads the way, followed by his son, Giovanni Pisano, and afterwards by Andrea Pisano; Ghiberti follows with a more pictorial treatment, and then comes Donatello, whose beauty of conception and delicacy of treatment has never been equalled; also Luca delle Robbia, Mino de Fiesole, Sansovino, and others. In painting, Cimabue is the first to rescue Art from the crudity of Byzantine treatment, and of whom Vasari says: "He achieved little less than the resurrection of painting from the dead." Giotto follows on these lines, and then come Botticelli, Masaccio, Perugino, Raphael, Andrea del Sarto, and Michael Angelo, with a host of others almost as well known. Thirdly, the Italians possessed men at this period who could turn their hands to either Art with almost equal facility. Giotto, as Architect, designs the Campanile at Florence, of which Ruskin says, in his "Seven

Lamps" (IV. sec. 43), that "power and beauty occur more of less in different buildings, but together, and in the highest possible degree, they exist in only one building in the world, the Campanile of Giotto at Florence," describing the bright sunny surface of glowing jasper, its spiral shafts and fairy traceries, so faint, so crystalline, that their slight shapes are hardly traced in darkness in the pallor of the Eastern sky; that serene height of mountain, alabaster coloured like a morning cloud, and chased like a sea-shell. And yet Giotto the painter can design such works as those in the lower Church of San Francisco at Assisi. Ghiberti was well-known as an Architect, and yet executes the two pairs of bronze gates to the Baptistery at Florence, which Michael Angelo described as "worthy of the gates of Paradise." Leonardo de Vinci paints the splendid "Cenacolo," or "Last Supper," at Milan, and yet carefully studied Architecture though he did not actually practice, and wrote an elaborate work entitled "Trattato delle Cupole," or a treatise on the

#### CONSTRUCTION OF DOMES AND CUPOLAS.

Raphael builds the Pal. Pandolfine at Florence, and was, on the death of Bramante in 1614, appointed Architect to St. Peter's by Leo X. (Giovanni de Medici), and yet as a painter he was the greatest Artist that ever lived. Lastly comes Michael Angelo, who, as painter, completes the Sistine Chapel, with the beautiful sybils in the spandrels of the windows, which have given the motive for the mosaics lately completed in St. Paul's Cathedral. Also the grand "Last Judgment" in the end wall of this and the private chapel of the Popes. As Sculptor his masterly hand carves out the figures of Lorenzo and Giuliano de Medici at Florence, with their attendant figures of Morn and Eve, and Dawn and Twilight. As Architect he erects the Laurentian Library at Florence, Lorenzo de Medici, with its noble hall and staircase, also the greatest building of Mediæval times, St. Peter's at Rome. Italy is particularly rich in monuments which excel in Sculpture as well as in Architectural details, due to Sculptors being trained in both Arts. The beautiful monuments to Cardinals Basso and Sporza in the Church of S. M. Del Popolo at Rome by Andrea Sansovino (the elder) are typical examples. Or again, that unfinished one to Pope Julius II. now in the Church of S. Pietro in Vinculi, at Rome, by Michael Angelo, which contains the celebrated figure of Moses. This is particularly interesting, as being the origin of the rebuilding of St. Peter's. Pope Julius II. intended to erect a monument to excel all his predecessors, and so commissioned Michael Angelo to design this, and then commenced the rebuilding of St. Peter's to receive it, commissioning Bramante to carry this out on an equally magnificent scale. Had he lived to see the completion of his idea he might have been content with the single epitaph of Sir Christopher Wren, "Si monumentum requiris circumspecti." The fourth reason underlying the success of Italian Renaissance was the power, influence, and munificence of the de Medici. Their palaces were meeting-places for all the most highly cultivated men of the day, both literary and artistic, and they set the example which was followed by the rest of the nobility of encouraging Art to a lavish extent, and greatly aided the development of Architecture, Sculpture, and Painting. The founding of the Laurentian Library at Florence, begun by Cosimo, and completed, together with its splendid building, by Lorenzo de Medici, was of considerable service to literature. The discovery of printing in the latter half of the fifteenth century gave also an immense additional stimulus, but this applies to other countries as well as Italy. Let us now consider more in detail the lines of Renaissance Architecture and the treatment adopted by those who commenced this new style. The three great pioneers were Fillipi Brunelleschi, 1377-1444; Leon Battista Alberti, 1398-1472; and Bramante d'Urbino, 1444-1514. Alberti was thus twenty-one years younger than Brunelleschi, and Bramante was born the year Brunelleschi died. Brunelleschi began Architecture during the early days of

our Gothic Perpendicular, and Bramante died during the last phase of our Tudor period. Brunelleschi adopted a Tuscan or traditional Etruscan style so notable in Florence, as shown, for instance, in the Pal-Pitti. Alberti evolved a Roman and somewhat lighter type of design, and was strongly influenced by systems of proportions. Bramante developed the lines of Alberti considerably, especially in the introduction of Sculpture, and found a richer Italian style. Brunelleschi's typical and best works are the Churches of San Lorenzo and San Spirito at Florence, and the great dome and cupola to the Cathedral. The plans of his Churches are quite different to the preceding basilican ones, such as San Miniato, at Florence, with its semicircular apse and raised chancel with a crypt underneath. S. Spirito is cruciform in shape, with a continuous aisle separated by columns from the nave, the total breadth across the transept being half the total length, or a simple proportion of 1 to 2, and the nave is in breadth one-sixth of the length, the reason being that from the earliest times there was a law, which is clearly repeated by Vitruvius and Alberti, that a Temple dedicated to the Divinity should be laid down according to the proportion of the human body, the breadth of which is one-sixth its length. This proportion of length and breadth is often to be seen in Early Renaissance Churches at S. Andrea and Mantua, by Alberti.

(To be continued).

#### KEYSTONES.

It has been decided to erect a Victoria Institute at Stourbridge, in commemoration of the Queen's reign.

The foundation-stone of the new public baths at Kingston-on-Thames was laid a few days ago by the Chairman of the Baths Committee.

An exhibition of memorials of the Emperor William I. has been opened in Berlin. It comprises 344 items, of which the last alone consists of 419 articles.

It has been decided to erect a goods and passenger station at Castle Bytham, on the Midland and Great Northern Joint Railway from Saxby to Lynn, and the work is to be commenced at once.

The corner-stone of Holy Trinity Day Schools, West Parade, Halifax, which are being considerably enlarged, was formally laid a few days since. It is estimated that the extensions will cost about £1200.

The Pope has presented the King of Serbia with a magnificent mosaic picture representing the exterior of St. Peter's on Easter morning. This fine work of Art has employed no less than 22,000 small pieces of stone and cement in its execution.

A statue of Lord Roberts is shortly to be erected in Calcutta in acknowledgment of his many services on the Indian frontier. The exact spot in which it will be placed will be to the west of the Red Road, a name well-known to Anglo-Indians.

Additions to the North Riding Infirmary, Middlesbrough, have just been completed. They comprise a new operating-room, two special wards, a lift, and a receiving-room, and have been built and furnished at a cost of about £2000, towards which a sum of £1030 5s. has been subscribed.

The trustees of the late Baron Hirsch propose to erect for Russian Jews in the lower part of New York, model houses or suburban homes to cost 1,000,000 dollars. Baroness Hirsch contemplates erecting at New York non-sectarian homes for working girls, similar to those she has established in Belgium and elsewhere.

At a meeting of the Tower and Spire Fund Committee held at the Deanery, Salisbury, the Dean announced that up to the present £11,300 had been subscribed out of the £15,000 required. It was decided that an urgent appeal should be issued to the public forthwith, with a view to raising the remaining £3700 required to complete the restoration of the most graceful Cathedral spire in England.

THE "BUILDERS' JOURNAL"  
PROBLEMS.

## SOLUTION TO No. III.

A post is fixed in each bank, in the line of section, as near the water's edge as possible, and well strutted on the side towards the river. A No. 9 B.W.G. wire is tightly strained between these posts, 2ft. 3in. above water-level. Upstream from these, two stronger posts are fixed, and well strutted all round. These posts are distant from the first ones about twice the length of the boat to be employed—say 24ft.: advantage may preferably be taken of trees, provided they stand near the water and in a line not widely divergent from the wire. Between these posts or trees, a 2in. rope is strained as tightly as possible, about 3ft. above water-level; and a snatch-block is made to travel on it, having attached to it a small tail-block, through which is rove a 24-thread coir ratline to serve as painter, one end of which is made fast to the stem of the boat and the other held by the boatman in the bow. A 12-thread coir ratline, to serve as warp for hauling the boat to and fro across the river, is made fast to the posts or trees carrying the rope, with sufficient slack to allow of its being handled by the man in the bow. To set out the points where soundings are to be taken, a slip of good clean tonguing-stuff, 10ft. long, is suspended by two wire hooks sliding upon the strained wire. A bit of narrow white tape is tied to the wire, plumb over the water's edge; one end of the suspended slip is adjusted plumb under this tape, and a second tape is tied to the wire at the other end of the slip, these tapes being thus 10ft. apart. The slip is then adjusted to the second tape and a third tape tied; and so on. The boat is hauled into position by the warp; and, by hauling or slackening the painter, her stern is kept at a convenient nearness to the wire for the surveyor to adjust the slip and tape-off the 10ft. lengths. These having been set out, the boat is in like manner hauled and adjusted for the soundings, which are taken at each tape with a graduated deal rod, its foot loaded to carry it quickly down through the water.

The following have sent in correct solutions to Problem III.:—\*W. F. Muckle, care of Mr. Warren, Bridge Street, Belper; \*H. F. Clarke, Albert Villa, Alexandra Park, Manchester; \*H. W. Basden-Smith, 6, Hillsborough, Plymouth; \*G. N. Glass, 23, Ossington Street, Bayswater, W.; \*L. Robertson, 50, Clare Road, Penarth; \*J. E. Jefferson, 8, Homesdale Road, Bromley, Kent; \*W. H. C. Kempe, Chantry House, New Shoreham; \*S. B. Birds, 47, High Street, Morley; \*A. H. Ough, 84, St. Paul's Churchyard, London, E.C.

The following are unsatisfactory solutions, whose results might be accepted (though with great hesitation) by the Engineer for whom the survey was made, and then only if no better could possibly be had:—\*A. Dodgeon, 35, Whalley Road, Clayton-le-Moors; J. Wilhamson, Tarvit, Cupar, Fifeshire, Scotland; J. R. Taylor, Overstream House, Victoria Avenue, Chesterton, Cambridge; G. A. White, 27, Spring Road, Portsmouth, Southampton.

Forty-four solutions were received in all, from all parts of the country. Many of the proposed methods contravene the conditions of the Problem, or consist of mere diagrams without explanatory memoranda, or otherwise fail to qualify as attempted solutions. To the first ten names, marked with an asterisk, a copy of Volume IV. of the BUILDERS' JOURNAL will be forwarded.

Mr. WILLIAM HAWE, of the firm of Hawe and Foley, Architects, Beverley, died very suddenly a few days ago.

The Secretary of State for Foreign Affairs has received a dispatch from Her Majesty's Agent and Consul-General at Sofia stating that tenders are invited by the Bulgarian Government for the construction of a railway line from Rustchuk to Tirnovo. Tenders should be addressed to the Minister of Public Works, Ways, and Communications (Construction Section), and must be sent in not later than June 7th next. The conditions, plans, &c., may be obtained from the Bulgarian Ministry of Public Works, on payment of 20fr.

## CANTERBURY CATHEDRAL.

ABOUT three-fourths of the sum mentioned by Dean Farrar in his 13th Centenary Celebration Fund Appeal has now been subscribed, and excellent progress is being made with the work of restoration, which, it is hoped, will be almost complete in the portions at present under treatment by next July. The careful system of treatment to which the crypt has been subjected has revealed frescoes and paintings on the vaulting which had been hidden for a very long time. Not only have the French texts inscribed by the Huguenots in the early days of their worship in the crypt been left untouched, but the text over the bay facing the Black Prince's Chantry (at present used by the descendants of the Huguenot refugees) remains as an evidence of their recent occupation of the south aisle. At places there were remains of as many as 20 coats of whitewash on the vaulting and stonework, but the whole of these have been removed. For centuries past the crypt has been open to wind and rain, but the whole of the window openings have now been glazed, gas illumination introduced, and a warm dry condition of things has succeeded the former damp, cold, and dreary state. The lowering of the floor to its original level, and the covering of the entire area with concrete, has proved an immense improvement to this interesting sub-structure, bringing into view the bases of the columns and restoring the original beautiful proportions. In compliance with antiquarian desires, the brickwork filling the arches leading to the apse of the chapel of St. Gabriel is to remain for the present at least. It has probably been there since about the year 1400, and obstructs the view of some very fine and probably some of the earliest Norman frescoes in the world. A most interesting discovery, made in the course of the excavation of the floor of the crypt, is that of a stone coffin of the date of the twelfth century, almost precisely similar to that of Stephen Langton in the Warriors' Chapel. The preservation of the cloisters has also been taken in hand. The zinc roofing was found, on examination, to be leaky everywhere, the supporting timbers, too, had moulded into touchwood in many places, and the vaulting was defective. The timbers, &c., have now been made good, and an entirely new lead roof constructed. Work in the Chapter House is also well in hand. The structural safety of the roof and ceiling has been secured, and the latter is now being redecorated in its original handsome design. The windows on the south side have been opened out and glazed, and that at the west end reglazed, and that at the east end is to be occupied by the stained glass to be presented by the Freemasons of Kent. The masonry is also receiving careful attention, Purbeck marble (the stone originally used) being largely employed to replace that which is defective. The carved work at the east end is found to be in very fair condition, but there is considerable redecoration to be carried out. The bells of the Cathedral are now to receive attention, and the Dean and Chapter are very anxious to accomplish the restoration of Bell Harry Tower. This is perfectly sound structurally, but the surface and the decorative tracery were some years ago reported upon as needing attention. This view is now emphasised by Sir Arthur Blomfield. The magnitude of this part of the restoration may be gathered from the fact that the erection of scaffolding would alone cost about £1000, and it must depend largely upon the continued inflow of subscriptions to the restoration fund whether this work is possible. That it is necessary is shown by the occasional fall of pieces of masonry on to the roof of the Cathedral, and by such inspection of the structure as is at present possible.

ADMIRAL SIR GEORGE NARES, on behalf of the Board of Trade, has held an inquiry at Llandudno into the application of the Victoria Pier Company for a provisional order to construct a pier, pavilion, and other erections in Llandudno Bay, opposite the property of the Victoria Palace Company.

## Professional Items.

ABERDEEN.—The Town Council has approved of the plans of the following buildings:—Alterations in connection with No. 393, Union Street, for Messrs. G. and W. Morgan, per Messrs. McRobbie and Milne, builders. Two dwelling-houses on the south side of Beechgrove Terrace, for Mr. George Coutts, Architect. Additions and alterations in connection with Nos. 2 and 4, Blackfriars Street, for Mr. Peter Stewart. Laundry in connection with the Royal Lunatic Asylum, for Messrs. Smith and Kelly, Architects. Alterations in connection with Walker's Court, Gallowgate, for Messrs. Hunter and Walker. Alterations at No. 14, Springbank Terrace, for Miss Catherine G. Paul, Prince Arthur Street, per Mr. James Symon. Addition to Whitehall Laundry, for Mrs. Humphrey, per Messrs. W. Henderson and Son, Architects. Rope manufactory, off Merkland Road East, for Messrs. John Taylor and Company, per Mr. H. Mennie, Architect. Wash-house at the rear of the Salvation Army Citadel, Castle Street, per Mr. James Souttar, Architect. Cottage on the west side of Holburn Street, for Mr. William McPherson, 134, George Street, per Messrs. Brown and Watt, Architects. Dwelling-house on the south side of Beechgrove Terrace, for Mr. James Kennedy, draper, per Messrs. Brown and Watt, Architects. Dwelling-house on the east side of Leslie Terrace, for Mr. William Sinclair, draper, per Mr. James A. Souttar, Architect.

ALDEBURGH.—Wentworth Castle, which has now been opened as an hotel, has a frontage of 300ft., and faces the sea. The building is in the Jacobean style throughout, carried out in white brick with Bath stone dressings. There are four principal bays, with projecting billiard-room at the south end and coffee-room at the north. The centre of the building is devoted to an entrance hall and hall lounge, the latter being divided from the hall by glazed screens and doors, and to which there are entrances both from the sea-front and the rear. This is a striking feature in the construction of the hotel. The ground floor, which is laid with wood blocks, contains spacious drawing, coffee, breakfast, reading, and writing-rooms, public and private smoking-rooms, and sitting-rooms. The first floor comprises complete suites of bedrooms and bed-sitting-rooms, with which is connected in a central position an Oriental lounge, and on the landings are cosy corners and seats. The second floor contains bed, bed-sitting, and double-bedded rooms. Well-lighted corridors lead to the various portions of the building. Bath-rooms and lavatories are on each floor, and particular attention has been paid to the sanitary arrangements, which are of the most approved system. The interior fittings and decorative work are tasteful. The Architect is Mr. T. E. Key, Bloomsbury Square, London, and the builder Mr. Geo. Knowles, Aldeburgh.

BATH.—The Marquis of Bath has laid the foundation-stone of the new Weymouth House Schools. The Architect is Mr. C. B. Oliver, and he has provided in the new schools for an increased accommodation of fifty, there being in all accommodation for 700 children. One donor has already promised to bear the expense of furnishing the girls' department, and the cost of fitting up the remainder is put at £500.

BELFAST.—It is expected that the new buildings of the Young Men's Christian Association will be completed in time for the opening ceremony to-day. The site, which is entirely occupied by the new block of buildings, extends along Wellington Place a distance of 86ft., and more than 230ft. from front to rear in Wellington Street. As the materials were necessarily limited to Belfast perforated brick, with Annadale brick facing and a sparing use of Dumfries sandstone for dressing, it was decided to adopt a simple treatment of Gothic. Messrs. Musgrave and Co., Limited, have erected the heating apparatus and the special

iron roofs and gates. The extensive plumbing and gasfitting contract has been carried out by Mr. John Dowling. Messrs. W. T. Coates and Son have done the electric lighting work, under the direction of Mr. J. H. Greenhill as consulting engineer. Messrs. Ebron and Co., London, have laid the marble mosaic flooring. The marble of porch has been executed by Messrs. Purdy and Millard. Messrs. Robert Patterson and Sons have supplied the locks and fastenings; Messrs. Riddle and Co. and Messrs. Reed and Kyle the grates and chimneypieces. The organ is being built by Messrs. Binns, of Leeds. The general contractors for the works were Messrs. W. McCammond and Son, who have executed their contract from the plans and under the superintendence of the Architects, Messrs. Young and Mackenzie.

The Belfast Corporation has accepted the plans for the proposed City Hall of Messrs. E. Thomas and Son, Westminster, whose estimate was £150,000. There were three plans approved of by the assessors, viz., those of the following firms; Messrs. E. Thomas and Son; Messrs. Malcolm Stark and Rountree, of Glasgow; and James Miller, of Glasgow. The assessors thought it right to go over the plans themselves, and take the measurements, and give their ideas as to the cost. The site of the new building will be on the quadrangle previously occupied by the old Linen Hall, and on the site facing Donegal Place.

BIRMINGHAM.—Respecting the project of a new County Court for Birmingham, the Department of Works is in quest of a suitable site for a new building, the erection of which has been deemed preferable to an arrangement for the provision of extra accommodation in connection with buildings proposed to be placed between the present County Court and the new factory in Corporation Street. The old Post Office might have been utilised but for difficulties as to the right of light of an adjoining property. It is not unlikely that the Improvement Committee may be able to offer a suitable site in the neighbourhood of Steelhouse Lane. A suggestion, we believe, has been made that the present County Court might be rebuilt in more attractive style, and to a greater height, and if a convenient site should not be found elsewhere, this solution would be a welcome one, especially if the Official promise of something better in the way of Architecture were duly redeemed.

The Public Works Committee of the Birmingham Corporation has decided to recommend the Council to accept the offer of Lord Calthorpe with reference to the widening of Edgbaston Road, the continuation of Lower Edwardes Street, and the improvement of the River Rea, and that the Public Works Committee should be authorised to carry out their share of the undertaking. The Baths and Parks Committee has already decided to recommend the adoption of that portion of the scheme connected with the provision of a Rotten Row. The scheme involves the giving up of a considerable portion of land by Lord Calthorpe, and an outlay upon the part of the two committees of nearly £17,000.

BURY.—The recently-erected steam laundry was opened at Bury on the 11th inst. It is a one-storied building, covering an area of about 4800ft., with a frontage of 42ft., towards Northgate Avenue, on high ground. The shaft is 50ft. high. The interior of the structure comprises entrance lobby, flanked on the left by the receiving-room, leading into the wash-house, 19ft. by 37ft., where are two large washing machines of the rotary type, made entirely of metal, with brass cylinders. The office is situated so that the manageress can supervise the departments. The machinery is driven by a powerful engine. The building will also include stabling, van-house, fodder, coal and hamper stores. The site comprises 2½ acres. Mr. H. Plummer, of Rattlesden, is the builder.

CELLARDYKE.—The Public School of Cellardyke has just been opened. The school formerly consisted of one story, but a second story has

been added, and the ground floor considerably enlarged at both ends. The school has accommodation for 600 pupils, and will contain a mixed and infant department. The cost has been upwards of £2500. Messrs. Dewar, Leven, were the Architects, and the contractors were: Mason, J. Lawrie; joiner, J. Forester; plumber, T. A. Dalzell; plasterer, R. Williamson.

CHELMSFORD.—A striking improvement is about to be carried out at Chelmsford. Mr. Chas. Pertwee has prepared plans for a new front for the upper portion of premises in Tindal Square. The present elevation, which, with its four old-fashioned oblong windows, is an extremely plain one, will be replaced by a new front of red brick, with eight ornamental windows and stone dressings. The work is to be carried out by Mr. F. Johnson, builder.

DUNDEE.—The latest suggestion regarding the statue of Her Majesty in Dundee, is to erect the statue immediately outside the gates of the High School, the back of the pedestal being against the line of the railings. With the consent of the High School Directors, the existing gates would be done away with, and the railing made continuous at this point, but an entrance would be provided on each side of the statue, and at a distance of a few yards round the curve. A more important alteration is proposed—namely, to remove the existing entrance at the east end of the building, and replace it with a carriage entrance in a line with Panmure Street, while a similar entrance would be provided opposite Euclid Street.

Building operations at the new Post Office in Dundee are proceeding uninterruptedly, and every week sees an appreciable difference in the aspect of the exterior. The third and last story is now approaching completion, so that by this time a very fair idea can be formed of the appearance which will be presented by the finished structure. The Architecture of the third flat is more ornate than that of either the first or second stories, with which, however, it is at the same time in perfect harmony. It is anticipated that the mason work will be completed early in the summer, and that the work of roofing the building will be begun in the course of a few weeks. The sculptors are busy on the carved panels of the Constitution Road front.

GOVAN.—Twenty-two designs for the new burgh hall and municipal buildings have been received by the Commissioners, and are now under consideration. The plans are displayed on stands in Robert Street Hall, the entire floor of which is taken up by them. The designs are extremely varied. Mr. George Washington Browne, Architect, Edinburgh, has been engaged by the Commissioners to examine the plans and select that which combines in the highest degree beauty and economy.

HALIFAX.—At Lee Mount, Ovenden, a Liberal Club is in course of erection. Memorial-stones have recently been laid. Mr. M. Hall, of Halifax, Architect, has prepared the plans of the new premises, which are to comprise a billiard-room for three tables, news-room, committee-rooms, and an assembly room, the assembly room to afford accommodation for four hundred persons. The estimated cost is £1600, and to this is to be added about £400, which will be necessary to meet the expenses of furnishing, making a total of £2000.

HAMPSTEAD, N.W.—The Chairman of the Public Libraries Committee of the Hampstead Vestry opened a new free public library and reading-room at Antrim Street, Haverstock Hill, Hampstead, on the 10th inst. The central library, which is being built at a cost of £5000, presented for the purpose by Mr. Henry Harben, is rapidly approaching completion, and branch libraries have been established in the Town and Kilburn Wards. The new branch library has been built at a cost of £2500, exclusive of the site, which was sold to the Vestry by the Ecclesiastical Commissioners for £250 less than its market value. Mr. C. H.

Lowe, the surveyor to the Vestry, designed the building, which is well adapted for its purpose.

HARPENDEN.—The Rector and Churchwardens have had under their serious consideration the necessity for a larger vestry at the Parish Church. The proposed vestry will give entrance to the Church to the east of the north transept. The scheme is intended to include two other objects: providing a stall for the clergy on the north side of the chancel, the present steps to the pulpit being diverted, and the alterations of the seats to the south of the choir, so that they may be used for the accommodation of adults when room for them is required, which is very much needed at Sunday evensong and on special occasions. Mr. J. R. Brown is the Architect.

HARROGATE.—The new Western Board School, situate in Cold Bath Road, Harrogate, has been opened by Mr. Amos Chippindale (vice-chairman of the School Board). The style chosen for the new school is Renaissance, freely treated. The school is certified for 305 infants and 620 mixed scholars, and is arranged on the now generally adopted central hall plan. Abutting on the west side of the playground boundary wall, and immediately between the girls' and boys' covered play-shed, a two-story building is erected, the ground floor of which will be used for instruction in cookery, whilst the upper floor (approached by an external stone staircase) will be used for boys' manual instruction and joinery class. The heating has been carried out on the low pressure hot-water system by Messrs. Alf. Dougill and Co., engineers, Leeds. The sanitary fittings have all been supplied by Messrs. Adams and Co., of York and Leeds, and are of the latest, best, and most efficient character. The following are the names of the contractors for the various branches of the work:—Excavator, mason, and bricklayer, Mr. C. Dawson, Harrogate; carpenter and joiner, Messrs. Raworth and Allen, Harrogate; slater, Mr. J. Shepherd, Harrogate; plasterer, Ald. C. Fortune, Harrogate; plumber and glazier, Messrs. J. Suttle and Son, Otley; painter, Mr. E. Draper, Harrogate; ornamental railings, gates, and general ironwork, Messrs. Rushworth Bros., Harrogate; concrete and playgrounds, Mr. J. Cooke, Huddersfield; wood-block floors, the Wood Block Flooring Company, Limited, London. Mr. E. F. Prentice has acted as Clerk of Works. The school has been built from designs by Mr. T. E. Marshall, Architect, Princes Street, Harrogate, under whose superintendence the whole of the work has been carried out.

KIRKBY-LONSDALE.—A stained glass window is to be erected in a village Church near Kirkby-Lonsdale, and is now being executed by Messrs. Wailes and Strang. The design of the window is a full emblazonment of the Royal Arms, with all heraldic accessions and appointments. In the centre is the shield with the quarterings of the United Kingdom, flanked on either side by its supporters, and surmounted by the helmet with closed vizor and crest. The mottoes—"Honi soit qui mal y pense," and "Dieu et mon Droit," are rendered on flowing scrolls. In two panels of tracery are represented medallions; one bearing the initials of Victoria Regina, with the crown of accession and the date 1837, and the other Victoria Regina et Imperatrix, with the Imperial crown and the date 1897. A border composed of roses, thistles, and shamrocks incloses the entire window.

LEICESTER.—A conference between representatives of the Leicester Bricklayers' and Plasterers' Societies was held on the 9th inst. to discuss the question which has led to the withdrawal of plasterers from a number of building works in the town, viz., whether *in situ* and screeding for wood-block and tile floors is bricklayers' or plasterers' work. Ultimately a basis of settlement was agreed upon, which it is hoped may lead to a permanent settlement of the whole question. It was decided that these terms should be submitted for the approval of the respective societies

concerned early next week, pending which it was considered inadvisable to make the details public.

**MIDDLESBROUGH.**—The Sanitary Committee had recently before them the question of increasing the accommodation at the public baths. The different sets of plans for additional slipper baths were inspected. The baths manager (Mr. Snow) thought the provision of four new slipper baths, which could be provided at a cost of £260, would meet the present requirements, but several of the members took a different view, and ultimately Mr. Frank Baker's plan for twenty baths, with a Russian bath at one end and having wood and glazed partitions (estimated cost £2500), was adopted.

**MONTROSE.**—For several months it has been proposed to improve the altar in St. Margaret's Catholic Church by the erection of a reredos, and the work was intrusted to Mr. Fairweather, George Street. The reredos is of Gothic design, made in richly-figured oak, and carved, and stands 13ft. 6in. high from the altar table, which latter is extended on both sides to suit the proportions. The tabernacle in the centre, with a richly enamelled brass door, is crowned by a throne, which again is surmounted by a beautifully carved spire. In front of the reredos are four panels, in each of which there will be a statue representing St. George, St. Andrew, St. Patrick, and St. David of Wales—the four national patron saints.

**NOTTINGHAM.**—The foundation-stones of the Nottingham and County Constitutional Club, which is to be erected upon a central site in Market Street, have been laid. Owing to the nature of the site numerous difficulties in relation to the preparation of the plans have been experienced. The frontage to Market Street will not afford any idea of the extent of the premises, the depth of the site from Market Street to Rigley's Yard being about 112ft. The principal entrance will be in Market Street, and will lead to a large central hall, from which will be entered a smoking-room and billiard-room for three tables. From the hall, by means of a stone staircase, will be entered a large dining-room. A private dining-room, committee-room, card-rooms, reading-room, with writing-room adjoining, are also to be provided on the first floor. The second floor will contain bedrooms for members, bath, stewards' rooms, the necessary culinary departments, and other offices. Facing Rigley's Yard, and on the ground floor, will be placed a large assembly hall, to accommodate from 350 to 400 people, with the necessary retiring rooms. The Market Street front is to be entirely of stone, and the style of Architecture adopted is Renaissance. The principal feature will be the large gable and the circular oriel window and balconies of the large dining-room. The Architect is Mr. A. R. Calvert, 18, Low Pavement, Nottingham, who obtained the work in competition.

**ST. HELENS.**—The Gas and Lighting Committee of the St. Helens Corporation has under consideration a proposed extension of the gas works, and has decided, in order to extend the retort house, to pull down seven cottage houses on the south side of Warrington New Road. The tender of Messrs. Bryan, Donkin, and Co. for exhausters and engine has been accepted; as also those of Messrs. E. and J. Dempster for the condenser, and Messrs. Ashmore, Benson, Pease, and Co. for the repair of two gasholders. In respect to these tenders, it has been decided to apply to the Local Government Board for sanction to borrow £4500, and a further sum for the proposed extensions to the retort house.

**TONG.**—A meeting of the School Board was recently held, and a letter was read from the Education Department approving of the plans for the proposed new school at Highfield. Plans for this building have been passing to and fro between the Board and the Education Department for over two years, and the plans now approved are practically as sent up at first. The accommodation is for 396 scholars. Messrs. W. and J. B. Bailey, of Bradford and Keighley, are the Architects.

**TOTNES.**—Though not the largest, the bells of Totnes Church are the oldest peal in the county of Devon, and probably one of the sweetest. Cast and hung in the old tower so long ago as 1732, they have for more than a century and a half regularly performed their mission. The Church itself, during that period, has passed through some vicissitudes. Thirty years ago it had fallen into a sad state of decay and semi-ruin, and enjoyed the unenviable distinction of being in a worse condition than any other church in the county. By degrees the entire fabric from roof to base has been restored, no less than £15,000 having been expended in making the edifice what it is to-day, one of the most interesting ecclesiastical buildings in Devon in perfect preservation and order. But in restoring the structure the bells were overlooked, and last autumn it was discovered that the timber which supported them in the tower was decayed, rendering it unsafe to ring them. It was at once determined to rehang them, and the work has been carried out by Messrs. John Warner and Sons, of Cripplegate, London, under the supervision of Mr. G. Dunn.

**WITLEIGH.**—Mr. W. E. Williams has been instructed to prepare plans for a vestry at St. Catherine's Church, Witleigh, in commemoration of her Majesty's Diamond Jubilee.

**WORCESTER.**—At the last meeting of the City Council Mr. George Caink, assistant-engineer, resigned his position. The Electricity Committee recommended that additional plant for the Powick Generating Station be purchased and laid down, at a cost of £8800. It was stated that the plant was being worked up to a point dangerously near to its maximum capacity, and it was a matter of necessity to provide extended plant for the largely increasing demand for light and current. During the twenty-seven months there had been no loss, except in respect of the amount paid for redemption of loans. The motion was carried, and the Brighton system of charging for light and current was adopted instead of the present system.

LAST year £3360 was spent upon Leeds Town Hall. The estimate for the next twelve months is £4200.

**MEMORIAL-STONES** of a new Liberal Club which is being erected at Crawshawbooth at a cost of £1800 were laid on the 3rd inst.

THE Lord Chancellor has opened the new County Court offices which have been erected in St. Peter's Churchyard, Dover, at a cost of £12,000.

New Wesleyan Schools, which have been erected at the rear of the Wordsworth Street Church, Penrith, at a cost of about £1500, have just been opened.

It was announced recently that the Midland Railway Company is about to spend half a million of money—plus the very large cost of the land—in the erection of a great railway hotel adjoining the Central Station, Manchester.

Two pictures, a supposed Murillo and a Van der Neer, have been stolen from their frames in the National Picture Gallery, Budapest. The Murillo represents St. Joseph and the Boy Jesus; the Dutch picture a burning city situated on a river, ships, and a windmill.

THE Committee of the Colonial and Continental Church Society has purchased a site for an English Church at Lucerne. The Church will be built on the north side of the Haldenstrasse, and is intended to seat 450 worshippers. The cost of the site and the building will be about £7000, which sum must be raised by special contributions.

THE Barrow Corporation proposes to spend £20,000 on new technical schools, public baths, and a recreation ground. The Mayor convened a public meeting, at which it was shown that the scheme finding greatest favour was a bridge to Walney Island. The Mayor pointed out that this could not cost less than £50,000, and, although there were difficulties with regard to it with the Admiralty, the Furness Railway Company, and the town of Millom, the Council had appointed a committee to look into the question.

## Trade and Craft.

### BUILDING TRESPASS IN CHEAPSIDE.

Mr. Justice North has delivered his decision in the case of *The Aerated Bread Company v. Shepherd*. This action was brought by the plaintiffs, the lessees of 51, Cheapside, against the defendant, the owner of 52, Cheapside, for alleged trespass in the rebuilding of his premises. The wall between the premises was a party-wall, but the judge upheld the contention of the plaintiffs that there was no common ownership, but that it was the entire property of the plaintiffs. The defendant was also held to have not complied with the provisions of the London Building Act, by placing his chimney flues against the plaintiffs' party-wall. His lordship said that he did not consider it necessary to grant a mandatory injunction, but awarded the plaintiffs the general costs of the action. Order made accordingly.

### OVERHEAD TRACTION FOR TRAMWAYS.

The Halifax Tramways Committee has decided to recommend the adoption of electric overhead traction for the Halifax tramways, and that before considering the details of the system the Committee or a deputation visit Walsall, Coventry, and Bristol. The Committee further recommends that the Gas Committee be asked to consider the desirability of removing the lamp-posts on the tram routes and lighting the streets by electricity from the tram-posts.

### DOUGLAS HARBOUR.

A committee of the Manx Legislature sat at Douglas last week for the purpose of taking evidence regarding the tranquillising of Douglas Harbour, which under present conditions is in an unsatisfactory state. Mr. James Walker, engineer to the Isle of Man Harbour Commissioners, submitted a plan showing a proposed extension of the red pier, which extension, he believed, would almost completely shelter the inner harbour. A number of masters of vessels and harbour officials gave evidence in favour of the lengthening of the red pier, and condemned the suggested lengthening of the battery pier.

### MECHANICAL TRAMWAYS.

Highgate Hill, which was the home of the first mechanical tramway in this country, is once more to enjoy the advantages as well as the disadvantages of this method of locomotion. The original line, laid down several years ago, was not a pronounced success, which was due, perhaps, to the system of construction. Profiting by the experience gained in South London, the company has introduced improved appliances. The cars will now be propelled by a continuous steel cable and "dummies" fitted with powerful automatic brakes; and this arrangement is expected to work as satisfactorily as that in operation on the Brixton and Streatham line. Colonel Marindin, one of the inspectors of the Board of Trade, having examined the Highgate Hill cable tramway and the whole of the machinery and vehicles, has granted a provisional sanction for the line to be opened for three months.

### ELECTRIC LIGHTING IN MANCHESTER.

Some remarkable statements were made at a recent meeting of the City Council showing the rapid growth of electrical lighting in Manchester. Plant was put down in the first instance to last, as was thought, for three years. In five months the plant was increased sufficiently to last, as was expected, twelve years, but it only sufficed for seven years. Alderman Higginbottom, chairman of the Electric Lighting Sub-committee, said: "Beginning with a capital of £120,000, they had increased it to £300,000, and that would be gone this year, and in another six months they would have to come to the Council for another quarter of a million for new plant." They began with 8000 sixteen candle lamps three years ago. Now there are over 70,000. It appears to be profitable to the city, for in

the first year expenses were covered, and in the second a handsome profit was made. Last year £11,000 of the profits were given in aid of the rates, and the cost to consumers was reduced 25 per cent., while this year it is said the cost will be reduced by another 25 per cent., and a larger sum given to the city in reduction of rates; and in a few years, Alderman Higginbottom added, "the new light will be within the reach of every man." So much has the undertaking increased that a new committee has now been formed—the Electricity Committee—"to deal with all matters arising under the Electric Lighting Acts 1882 and 1888." In spite, however, of the extension of electric lighting, the consumption of gas steadily increases, and the Gas Committee will still have enough on their hands to occupy their best energies. The use of gas for cooking and in various ways for heating purposes, as well as for gas-engines, is every day becoming greater, and will do something to lessen the canopy of smoke which too often broods over Manchester.

#### RAILWAY EXTENSIONS IN MANCHESTER.

Two or three railway developments of great magnitude are now being carried out at Manchester. Foremost is the Central Station extension. That already huge station is the joint property of the Midland, Great Northern, Great Central, and the Cheshire Line, Railway Companies; and not only is the large space now fronting the station to be absorbed, but the Midland Company is constructing a large hotel, which will cost, plus the purchase of very valuable land, half a million sterling. Moreover, the Great Northern Railway Company—which has hitherto shared the merchandise depot attached to the Central Station—is building its own goods station, which will join up to and be connected with the lines of the Central. When complete, Manchester's Central Station and hotel will cover about a quarter of a mile square, and will be one of the largest railway depôts in the world.

#### SINGULAR RIGHT OF WAY CASE.

At the Surveyors' Institution, the arbitration case of The South Mimms Rural District Council v. Marsden came on for hearing on Tuesday, the 13th inst., before Mr. A. Savill, sitting as sole arbitrator. The case was a singular one. The claim was for £5608, made by Mr. B. Marsden, a dairy farmer, of South Mimms, near Barnet, against the District Council, in respect of a right of way through the former's estate. For some time past the Council has been considering the establishment of a sewage farm for the district. Recently it gave notice to Mr. Marsden that it would require a portion of his estate for the purpose of making the necessary roadway and ground farm. At that time a public right of way ran through a part of the estate, but the Council decided not to use this, but to open up another road which would run through Mr. Marsden's homestead. This, it was held by the claimant, would considerably damage the best part of the estate, and further would affect his business as a dairy farmer by reason of the fact that large quantities of sewage matter would be carried through the estate, and past the farm where the dairy business was carried on. In respect of the damage which would be sustained by the Council acquiring the right of way, a sum of £5000 was claimed, this sum not to include the cost of purchase of twenty-five acres needed by the Council for their sewage farm. Mr. R. Oakley and Mr. Driver, in support of the claim, estimated the amount of compensation at £5608. Mr. Freeman, on behalf of the Council, having asked for a more moderate award than the amount claimed, the case was subsequently closed, and the arbitrator reserved his award.

#### WEST HAM CORPORATION TENDERS.

Mr. Ernest Baggallay, who recently held a public inquiry into certain allegations with regard to the acceptance by the West Ham Corporation of tenders for the installation of electric lighting in West Ham, has made his report, which has been presented to the borough

council. The first charge was that a Mr. Paris called on the Electric Construction Company and offered to obtain the services of a member of the West Ham Council in getting the contract, for which the councillor would have to be paid, and Mr. Baggallay reported that there was nothing to show that Mr. Paris was acting otherwise than on his own responsibility, and that therefore the nature and object of his call on the company had no importance. The second charge was that Mr. Councillor S. T. Hunns, a member of the sub-committee for the consideration of the tenders, himself made corrupt overtures to the Electric Construction Company, and Mr. Baggallay, in relation to this, said it was not surprising that the Electric Construction Company should have looked upon this visit with suspicion, but the evidence went no further, and he did not find that any corrupt conduct was proved against Mr. Hunns. The last allegation Mr. Baggallay described as the most important. It was that the West Ham Corporation had been corruptly influenced to accept tenders which were not the most advantageous to the borough. The eight tenders accepted amounted to £23,467, and if the lowest tender in each section had been accepted, the total cost would have been £15,704. This difference of £7763 required some explanation, and Mr. Steinitz, the electrical engineer of the Corporation, upon whose advice and recommendation the sub-committee implicitly relied, was examined upon the tenders at considerable length. His answers satisfied Mr. Baggallay that he had acted throughout with perfect honesty, and that there was no reason whatever for supposing that he had been influenced by any corrupt or improper motive.

#### ST. MARTIN'S CHURCH STEPS.

The steps of St. Martin's Church are not to be removed. The vestry of St. Martin's-in-the-Fields had the hardihood to propose that one of the flights of steps leading up to the Church should be done away with. Anyone passing the Church will have noticed that there are two flights of steps with a terrace or landing between. The idea was to make one continuous flight of steps, and so widen the pathway by more than 5ft. But this raised a keen controversy amongst Architects. Several Architectural Societies threatened strenuous opposition, so that when the vestry came to the County Council for a grant to carry out the improvement the Improvements Committee recommended that the Council refuse. Generally public bodies are supposed to be ruthless destroyers of the ancient and picturesque, but now they are more jealous guardians of "historic sites" and Architectural features than even a vicar and his churchwardens. It is an interesting Architectural question whether, if the steps were removed back within the great pillars, the effect of the Church front would be spoiled.

#### LEAKY RAILWAY BRIDGES.

At a recent meeting of the Public Works Committee of Cardiff Corporation, Councillor F. J. Beavan presiding, Councillor Mildon made strong complaint about the leaky condition of the Great Western Railway Bridge over Penarth Road, the Rhymney Railway Bridge at Lowther Road, and other railway bridges in the town, stating that dirty water came through in large quantities in some places, and soiled the dresses of street passers. The Borough Engineer said he had already called the attention of the Great Western authorities to the Penarth Road Bridge, and the meeting instructed him to write again to those people and also to other railway companies, calling upon them to put their bridges over streets in the borough into proper repair.

#### NEW AMERICAN RAILWAY.

An electric railway sixty miles in length, to be operated by alternating current, is projected to connect the cities of Detroit and Port Huron, Michigan. The line will be single track, with "turn-outs," following the western bank of the St. Clair and Detroit Rivers and the shore of

Lake St. Clair. It will carry both freight and passengers. Two-car trains will be run, consisting of a 33½-ton motor car and a 15-ton trailing-car. There is to be but one generating plant on the line, about twenty miles from Detroit at a point which will be about the centre of load distribution. Three-phase current will be generated at this station, which will be converted by rotary transformers placed at four sub-stations along the line, from which direct current will be delivered into the feeder circuits.

#### PLYMOUTH AND DISTRICT BUILDING TRADES.

Some months ago attention was called to the fact that the master builders of the district had been served with notices from the Plasterers' Society, as well as other trade organisations, to the effect that on and after May 1st certain increased rates of pay would be demanded. At the time, six months' notice was given, and this expires at the end of the present month. Little attention was paid to the matter at the outset, but finally the Master Builders' Association met, and agreed to meet a deputation from the men of the various trades. These meetings took place, and we understand the masters were prepared to meet the men on certain points, but could not see their way clear to agree to the whole of the demands. The men decided to accept nothing less than what they had applied for, and so matters remain as far as the workmen are concerned.

#### A BUILDER'S APPEAL.

In the Court of Appeal, before the Master of the Rolls and Lords Justices Lopes and Chitty, the appeal of the plaintiff in the case Smith the younger v. the Rural District Council of Chorley recently came on for hearing from the verdict and judgment of Mr. Justice Kennedy and a special jury at the Manchester Assizes. The plaintiff, who is a builder at Chorley, sought for a *mandamus* to compel the defendant Council to pass the plans of a house in Back Lane, Chorley, which the Council declined to do on the ground that if the house was built it would make the street 24ft. wide instead of 36ft. 6in., which was the minimum width allowed by the bye-laws. The plaintiff's contention was that Back Lane was not a new street, and the jury were of this opinion, but his Lordship said that the point he had to decide was whether a writ of *mandamus* was the proper remedy, and, after carefully considering the arguments and the numerous authorities referred to, he came to the conclusion that the defendants' contention was well founded, and that the action for a *mandamus* could not be maintained. The plaintiff now appealed on this point of law. At the conclusion of the argument their Lordships dismissed the appeal, refusing to interfere with the discretion the Council had exercised in the matter.

#### DEFECTIVE MORTAR.

At the Birkenhead Police Court, a builder, named Walter Roberts, residing at Waterloo, was summoned, at the instance of the Corporation, for using in the erection of houses, in Hinderton Road, mortar by which the bricks in the walls of such buildings were not properly bonded together, and which was not good mortar compounded of good lime, as required by the bye-laws. It was stated that, when the Surveyor inspected the buildings, he detected a strong, nauseous, and sickening odour which emanated from the mortar being used in the building operations, and he instructed the building inspector to make an investigation. The inspector found that the mortar used was being ground away from the building at an old quarry, and that spent gas lime was employed in its manufacture, no other lime being used in it.—Mr. Charles Brownridge, borough engineer and surveyor, said he had seen a sample of the mortar used in the construction of the buildings, and also had a sample of the gas lime. The mortar seemed to be composed of spent gas lime and red sandstone. He did not regard this as proper lime for the purpose of making mortar; it was a waste residual, and, having done

its work as a purifying agent, he thought it was entitled to a rest, at any rate for building purposes. It was obtainable free, and was not such a lime, he thought, as came under the definition of suitable material as required by the bye-laws. He thought the use of mortar made from such material would tend to make insanitary and unhealthy dwellings, and he would therefore not accept the responsibility for the use of this material. He considered it undesirable, bad, and not the material specified in the bye-laws.—In cross-examination, witness said he had never heard of a prosecution for the use of gas lime, but he had never heard of spent gas lime being used for such a purpose. The lime might be worth 3s. a ton as a manure. He had heard that the Gas Department had used gas lime for building purposes, but their premises were exempt from the Corporation bye-laws.—Mr. Collingwood Hope: So that they could put up what rubbish they liked?—Mr. Brownridge: I am sorry to say they could.—For the defence, Mr. Collingwood Hope submitted there had been no contravention of the bye-laws. This mortar had been manufactured from gas lime for some years past, and, as the bench had heard, the Corporation itself had used mortar made from gas lime in one of its departments. Surely there should not be one law for the Corporation, and another for the builders.—Mr. Peter Wynne, builder, was called, and stated that he had been using mortar made from gas lime for the past eighteen months, and had never been prosecuted for using it. In his opinion, it was a very good mortar.—Mr. Bancroft, builder, said he had used this mortar, and it was a good mortar.—Several other builders gave evidence to the same effect, but the bench found the charge proved, and imposed a fine of 20s. and costs.

### KEYSTONES.

MR. JOHN BRIGG, M.P., and the members of his family have promised 1000 guineas towards the cost of enlarging and endowing the Keighley and District Hospital.

THE memorial-stone of the new senior public school for West Calder has been laid. The school is estimated to cost about £5000, and will accommodate 460 scholars, and have a hall for secondary education.

THE Boston Harbour Commissioners have accepted the tender of Messrs. Spagnoletti and Crookes, of London, to erect an electric light installation at Boston Dock, at a cost of £1682. The estimate of Mr. A. Collins, the consulting engineer, was for £1267.

At the Painters' Hall, Little Trinity Lane, which was rebuilt after the Great Fire in 1666 by the mortgaging of the plate of the guild, Sir Edward J. Poynter (the President of the Royal Academy) was recently presented with the honorary freedom of the Painter-Stainers' Company.

THE amount required, under the head of public buildings in Great Britain, in the estimate to meet the cost of the enlargement of the melting-house at the Royal Mint is £1100. The enlargement is necessary in order that the Mint may satisfy the increased demands for coinage.

A COMMITTEE of the House of Commons has passed the Bill promoted by the London County Council authorising the construction of a subway under the Thames, commencing in Greenwich, near Brewhouse Lane, and terminating at Millwall, near the western boundary of the Island Gardens, Poplar. The time granted for the construction of this work is seven years.

At the St. Clement Danes Vestry Hall a meeting was held in furtherance of the project for the erection of a parish house. The Rector detailed the history of the parish and the progress of affairs which have necessitated the building of a parish house. He said that Mr. W. F. D. Smith had presented the site, and the building was now in progress. He had collected £2270. The building will comprise a large hall, class-rooms, a soup and food kitchen, a crèche for babies, and ironing and mangling rooms.

## Correspondence.

### WHO PAYS FOR THE TROWEL?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Nine times out of ten the contractor provides (i.e., pays for) the silver trowel the foundation stone of a new Church is often laid with, and the Architect presents it.

Yours obediently,

H. H.

### POLISHING FLOORS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Is there any special method of treating paraffin wax when it is used in place of beeswax for polishing flooring, and, if so, where can particulars of said method be obtained? I am sure, if there is any improved mode, some of your numerous readers will be aware of it.

Yours faithfully,

E. R. B.

### A QUESTION OF WATER SUPPLY.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Over thirty years ago a row of three houses were built in a suburb of Leeds, as an investment. Since that time these three houses were sold to three different persons. Now the owner of the second house gives notice that he has an insufficient supply of water, owing to the third house being supplied by the same pipe, and says that he is going to have the pipe (which goes under his house) cut off. This is a false statement, as the terrace goes up smartly in height, and it stands to reason that if the third house (which is farthest up the hill) has an excellent supply, surely No. 2 must have a still better, being lower down, as the water has to go uphill. The reason, I may state, of No. 2 giving notice is that some time ago a petty quarrel broke out between Nos. 2 and 3, and which has never been made right. Has No. 2 the right to cut off the water of No. 3? The houses have belonged to the three individual owners about ten years, and each bought the rights of their respective houses. A. J.

April 10th, 1897.

THE Brighton Corporation has resolved to spend £12,000 on the protection of the Madeira Road foreshore. The scheme decided upon embraces the widening of the roadway from the site of the chain pier to Royal Crescent from 40ft. to 60ft. and the erection of two groynes with breastwork of timber.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS and SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two.

Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St.,  
Strand, W.C.

## SOCIETY MEETINGS.

### Glasgow Architectural Association.

At a meeting of this association, held in the rooms, 187, Pitt Street, on Tuesday, the 6th inst., Mr. Wm. Tait Connor, A.R.I.B.A., in the chair, Mr. Wm. Fraser, A.R.I.B.A., read a paper on the "Influence of Economics on Architecture." He showed the bad effect the present land tenure had on Architecture, how, especially where leases of a limited period existed, the buildings were built only to last out the lease, and how building for profit, and not for use, tends to depreciate the Art. He showed, also, how the unequal distribution of wealth, competition, and the sub-division of labour were against the appreciation of good Architecture and unfavourable to thoughtful design and good workmanship. The remedy he suggested was collectivism, which, he said, would give greater opportunities for good Architecture, as buildings would only be erected when required, and not as profitable speculations. There would be no glaring inequalities in wealth, with the ostentation of riches and the degradation of poverty. The worker would be well fed and be sure of his work, and could therefore take greater delight in it and produce better work. There would be no need for work being cut down to the cheapest point to make things pay, for buildings would be erected for the good of the community, who would take a delight in seeing their own property beautiful. On the motion of Mr. James Craigie, a hearty vote of thanks was awarded the essayist.

### Edinburgh Architectural Association.

Under the leadership of Mr. Hippolyte Blanc, R.S.A., the members of this association on Saturday week visited Niddry and Duntarvie Castles. The former, situated in Kirkliston parish, Mr. Blanc described as a fair example of an early keep, one showing the first development from the simple square tower. The doorway in the inner angle enters upon a circular staircase leading to the several floors, now in ruin. The walls average 9ft. in thickness. The foundation of the tower was ascribed to George, fourth Lord Seton, probably in the last quarter of the fifteenth century. The castle receives prominence in history as having in 1568 afforded shelter and protection to Queen Mary. During the troublous times of Charles I. and II. the castle and lands passed to the family of Hopetoun, the castle giving the title of Baron Niddry to Lord Hopetoun. Duntarvie Castle, situated in Abercorn parish, Mr. Blanc explained, was a residential manor house of about 100 years later date than Niddry. It presents a large rectangular building, 80ft. long, facing south, with projecting wings at the extremes on the north side. This castle was in marked contrast to Niddry, the walls being so much thinner. There was much evidence to associate the period of foundation with the end of the sixteenth or beginning of the seventeenth century. The castle continued habitable until quite recently, and is now in ruin.

THE Duke of Cambridge has unveiled the tablet to the memory of the late Field-Marshal Sir Patrick Grant, in the corridor south of the chapel at the Royal Hospital, Chelsea.

MR. WALTER MORRISON, M.P., has announced his intention of building a Chapel at Giggleswick. The building of the new Chapel, which is estimated to cost between £15,000 and £20,000, will be commenced at once, plans having already been prepared.

THE Dean and Chapter of Lincoln have contracted with Messrs. Willis and Son for the rebuilding of the Cathedral organ. In order to make the organ as perfect as possible, it has been thought expedient to prepare for the addition at some future time of several stops and accessories, which cannot be included at present for want of funds. The amount at present promised is £3630, and to add the stops, &c., which are omitted would require £645 more. It has been decided to make a trial of electro-motors for driving the blowing apparatus, and it is believed that this will be the first Cathedral organ in England to be blown by electricity.

## COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
May 1	<b>ROADS—(Continued).</b>		
No date.	King's Lynn—Road Material	Corporation	E. J. Silcock, Borough Surveyor, King's Lynn.

## PLANNING OF SMALL HOUSES.

(Continued from page xviii.)

By H. V. LANCHESTER, A.R.I.B.A.

No. IV.

THE three designs given this week are for somewhat larger semi-detached houses, the two latter being placed on sites having larger frontages; these might, with slight

a reasonable size for the latter is somewhat unnecessarily large for the former. With the average household, one, or at most two, large bedrooms may be required, and the rest would be better divided into smaller apartments.

Where there is a second floor it may be conveniently utilised as nurseries when such are required, but it is hardly profitable in buildings of this size to make special arrangements for the purpose, however desirable it may be in larger houses, and where they are erected to meet personal requirements.

mind that the upper part of the window opening contributes much the larger proportion of the light, and if it is not taken up to within, say, a foot of the ceiling, compensation must be made by increased area. Under ordinary circumstances the proper height for the lower sight line for the glass is 2ft. 6in. for sitting rooms, and 3ft. to 3ft. 3in. for bedrooms. In the case of a particularly attractive outlook, and more especially where the ground falls sharply from the building, these heights should be reduced, and in the case of attics with

No 10 - SEMI-DETACHED HOUSE

CUBE AT 12° = £150

modifications in positions of chimneys and the form of roof, be found suitable for houses entirely isolated.

It will be observed that all these plans provide the convenient adjunct of a service lobby between kitchen and dining-room, that the number of bedrooms is fairly proportioned to that of the sitting-rooms, and that the former are of reasonable size. One often notices in houses rather above the smaller class that the bedrooms on the first floor follow the sizes of the rooms underneath, whereas

No reference has been made to the proper proportion of window area required to satisfactorily light a room. A good old rule gives one-tenth of the floor area as a suitable size. This should prove sufficient, except in the neighbourhood of large towns, or when the windows are on the shorter side of the room. It is better, however, to make the windows rather larger than this, as the amount of light is frequently diminished by the use of heavy curtains, though the deep valance is, happily, a thing of the past. It should be borne in

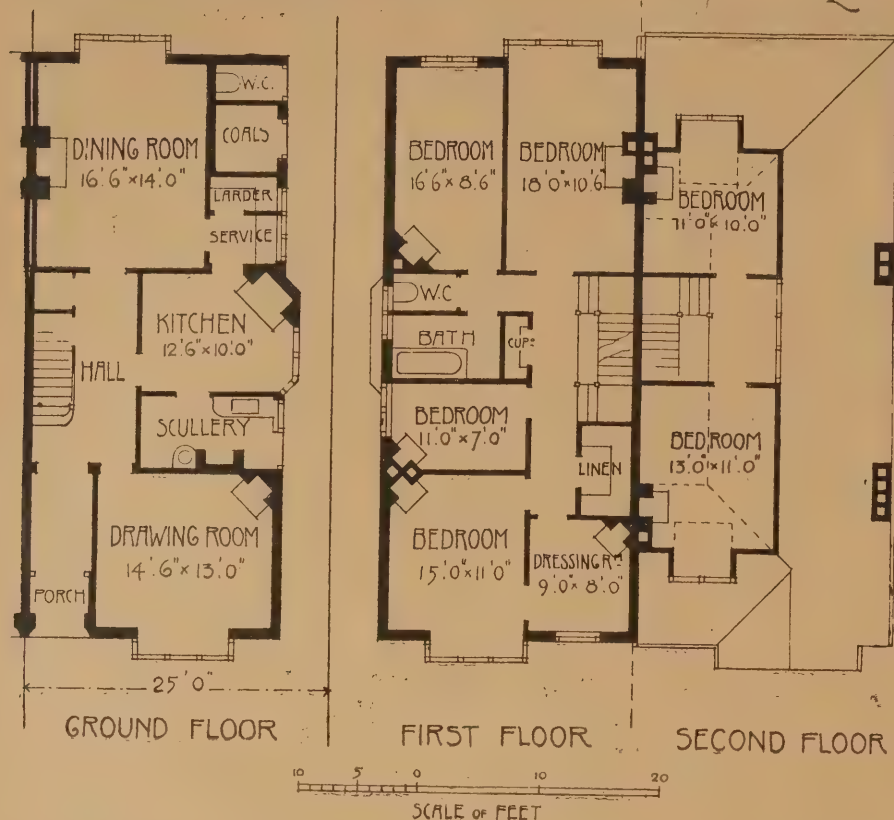

dormer windows, it is frequently convenient to place the sills somewhat higher. Where the windows are casements, with mullions and transoms, it is important to arrange that the latter do not interfere with the outlook of a person standing in the room; the under side should not be less than 6ft. 3in. from the floor level.

Since the general introduction of electric light instead of gas, it has been possible to reduce the height of the rooms. A room 10ft. high with several gas burners becomes intoler-

N<sup>o</sup> 8 - SEMI-DETACHED HOUSE

CUBE AT 12' = £110

able in the course of two or three hours unless ventilators are provided at the ceiling level, whereas when gas is not used a height of 9ft. is ample, and as regards appearance is to be preferred. Another old rule gives as the proper height for a room the third of the total produced by adding length and breadth together; this errs, if anything, on the side of excess of height; while it is, perhaps, suitable enough for a public building, or where the rooms are elaborately decorated, it is less in

agreement with the more homely character of domestic work, and 6in. to 1ft. may fairly be deducted in the latter case. Where there are several rooms considerably varying in size, of course some compromise must be effected with regard to a suitable height; at the same time careful planning may often enable one to give greater height to a larger room and less to a smaller, as, for example, in the case of the kitchen offices to plan No. 9. Moreover, considerable difference can be made in the apparent

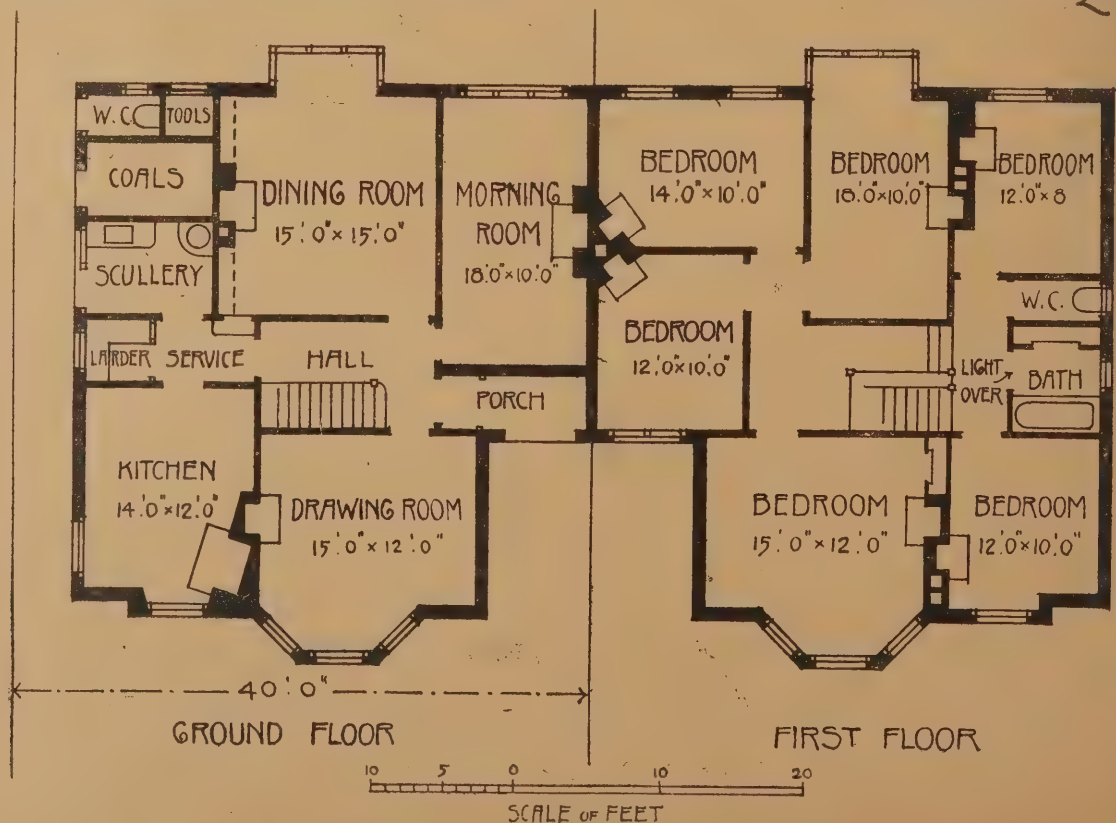

height of a room by the treatment of the ceiling cornice and walls, so that under the usual conditions with a small house one hardly risks failure in this matter.

At the Court-house, Helmsley, last week, an enquiry with reference to an application made by the District Council for permission to borrow £500 for works of sewerage and sewage disposal, was held by the Local Government Board Inspector.—Mr. Robert Pearson, clerk to the Helmsley District Council, explained that in the first instance a loan of £1500 was granted for carrying out the plans approved of by the Local Government Board. These plans had been carried out in their entirety by a special local committee, and the actual expenditure on the drainage was £1913. The lowest tender had amounted to £2,223, and thus the committee had saved £310.—The various items which had occasioned the excess of expenditure over the £1500 was explained by Mr. Fowler, the engineer of the works, who showed that the scheme had been carried out in conformity with the requirements of the Local Government Board and their inspector.

At Bootle, the Breeze Hill reservoir, which has just been completed, is designed to provide for fluctuations in the hourly and daily demand, and to ensure a steady uniform flow throughout the twenty-four hours, as well as to store water for use during temporary stoppage in the delivery from Prescott or from the pumping stations. The site at Breeze Hill is at an elevation of about 145ft. above the sea level, and the population to be supplied is about 80,000, requiring an average daily supply of from 2,000,000 to 3,000,000 gallons. The capacity of the reservoir exceeds 6,000,000 gallons. Its length is 268ft., breadth 240ft., and average depth 16½ft. The area at top-water is 7147 square yards. The arching of the roof consists of seventeen rows of parallel arches, 12ft. span and 240ft. long, with thirty-four groined abutment arches, 12ft. span and 22ft. long. The arches are covered with soil, which will be grassed, and the top of the reservoir laid out with walks. The walls of the reservoir are composed of concrete, with clay puddled backing, and lined with asphalt. The piers which carry the arches are of brick-work, and the floors of concrete with a facing of asphalt. The cost of the work was £16,661.

## SANITARY SCIENCE.

(Continued from page xxiii.)

By PAUL OGDEN.

## HOUSE DRAINS.

CONCLUDING this short series of articles, I come to the question—the very important question—of house-drains. The properties of a sewage-flow are (1) its viscosity, (2) its velocity—which depends upon two subsidiary properties, viz., the hydraulic mean depth of the stream and its inclination—and (3) the scouring action of the stream upon the bottom of the channel. In respect of the first of these we may take it to be equivalent to that of water. As to the second property, if the cross sectional area of a stream is divided by the width of its cross-section measured along its bed, the result is the hydraulic mean depth, and the greater the depth the greater the velocity, providing, of course, the inclination remains the same. Coming to the question of the velocity of a sewage-flow—the flow of a liquid is influenced by the friction between it and the channel through which it flows, and it is more or less retarded, accordingly as the extent of the surface of the channel with which it flows in contact is great or small, in relation to the quantity of liquid flowing through the channel. The quantity of liquid discharged by any channel of given size, as in a pipe of given diameter, is the result of the sectional area of the stream multiplied into its velocity. It is desirable that the velocity of the sewage should be considerable. In circular pipes the least extent of surface is offered in relation to the quantity discharged; therefore the least obstruction to the flow of sewage, when the sewage half fills the pipes, in all cases within the limits of practice. Dealing with the question of solid deposit, the third property has necessarily to be considered so that

## STOPPAGES OF THE SEWER

or drain may not take place from the accumulation of solid matter. In Beardman's hydraulic tables it is stated that 30ft. per minute will not disturb clay with sand and stones, 40ft. per minute will sweep along coarse sand, 60ft. per minute will sweep along fine gravel, 120ft. per minute will sweep along round pebbles, 180ft. per minute will sweep along angular stones. Mr. Wicksteed made some experiments with a channel having a semi-circular bottom, and he found that with a bottom velocity of 12 $\frac{1}{2}$  in. per second coarse sand, small pebbles, rounded stones, and pieces of brick 2 in. in diameter were carried along, the larger ones moving rapidly and stirring up the sand and small stones, which moved slowly. With a velocity of 21 $\frac{1}{2}$  in. per second iron borings, together with all the previous substances and pieces of brick 3 in. in width were carried along. In these experiments the fall of the surface with the water and the bottom of the channel were the same, viz., 1 in 139. The velocity in a 6 in. pipe running half full, and having a fall of 1 in 60, would be fully 250ft. per minute, and this multiplied into the sectional area of the stream would give a discharge of 24 cubic feet per minute, or 150 gallons. If we take the fall at 1 in 120, which would give a mean velocity of 3ft. per second, or 180 per minute, we should have a discharge of 100 gallons per minute. No household discharges so much sewage as this. If the sewage does not half fill the pipe the velocity will not be so great. Some authorities calculate the discharge of rain and sewage water from one house as not exceeding two cubic feet per minute. A 6 in. pipe is large enough for a mansion or for four or five ordinary houses. The stoppage of a drain in most cases is the result of bad laying; the points have not been left clean, or if the socket is not quite perfect no attempt is made, in laying, to adapt or fit them one to the other. Another cause is the inclination to irregularity of course. This is more apparent when the fall is slight. The bottom of

## THE TRENCH

should be carefully prepared of an uniform inclination, the pipe-sockets being let into the

bottom, not packed up in loose stuff, as is sometimes the case, with pieces of stone or slate or brick-bats; if the sockets are let into the bed the whole pipe takes its bearing. The bottom half of a circular pipe joint should have the greatest care and attention; it should be made true upon the inside and a woodrake cut to the section of the half circular to clean any cement or other material used in pointing, in order that the flow may be perfect and free from interruption, for if care be not taken in this matter the sewage will collect at points where cement protrudes, and foul the drain. When the pipe is bad, or riddled, at any rate small stuff should be evenly rammed on each side and under, coarser material being used on top. Opinions differ as to whether the top half of the joint should be left in such a way that it will serve to take the moisture like a butt joint or field pipe; when this is done it is usual to cover the socket with broken stone or gravel to form a kind of filter. Probably the best course would be to make the joint tight in cement, and employ a separate drain near the surface to drain the land. When drains go under a house—and they never should do so where it can possibly be avoided—the pipes should be embedded in concrete; some have suggested the use of iron pipes, with the joints run in with lead, and this, I believe, is the most common practice nowadays. These pipes are about nine feet long, and consequently, there are fewer joints, and they resemble the joints of a gas-main. Junctions should enter the drain in

## THE DIRECTION OF THE FLOW,

and never at right angles. Some have proposed the insertion of inspection-eyes at all the breaks; others say they are not advisable, because they become receptacles for sewer gas which might escape. Various patent lids to pipes have been taken out, and are mostly of an oval shape, so that a sweep's brush may be inserted, and the drain cleared and inspected. The lids should be of iron, strongly made, and fastened down with Roman cement, which does not set so hard as Portland, and which consequently allows more easily of the removal of the lid.

## BRADFORD SEWAGE SCHEME.

THE Borough Surveyor of Bradford has prepared a statement giving particulars of the proposed new sewage purification works. From it we learn that the scheme consists chiefly of beck and road improvements. The net area of land available for sewage disposal purposes is 36 $\frac{1}{2}$  acres, of which it is intended to appropriate 17 $\frac{1}{2}$  acres for precipitation purposes, including tanks and buildings, and 19 acres for filtration areas. Between 12 and 13 acres are occupied by the chemical works, Dumb Mill, and the beck and road improvements. An agreement has been made with the Midland Railway Company for an exchange of land. The existing sewage works may be kept in operation during the carrying out of the beck and road improvements. The largest item of expenditure is for improving the Bradford Beck, which at present winds its way almost through the centre of the site. It is proposed to construct an entirely new course for the beck, 24ft. in width, for a total length of 1300yds. The new watercourse will have a gradient of 1 in 500, and sufficient capacity to cope with the heaviest rains. The removal of the weir behind Dumb Mill will enable the Corporation to lower the bed of the beck about 5ft., and prevent any further possibility of flooding to the adjoining lands, to which they have hitherto been subject. The lowering of the beck will also furnish a difference of level of 22ft. between the invert of the main sewer where it enters the new sewage works, and the point where the effluent is finally discharged into the watercourse. This difference in level will be of great advantage, as it will admit of the sewage and effluents passing easily through the precipitation tanks and filter beds by gravitation.

## THE INVERT OF THE BECK

is intended to be formed with a foundation of cement concrete, covered by two rims of brick-

work, the lower rim being of red bricks and the upper rim of blue Staffordshire bricks laid in cement mortar. The Canal Road, as improved, will run at a higher level alongside the beck, and for a considerable length it will be necessary to provide a retaining wall to support it. The present proposal also includes the widening and improvement of the high and low level roads adjoining Frizinghall Station. Although these roads are formed at a much higher level than that of the beck course, there will be no need in this case for an expensive retaining wall, as there is ample space to admit of the formation of slopes. Unfortunately, in the previous case, a retaining wall is absolutely necessary, as the width of the site is already too limited for the construction of tanks, buildings, beck-course, and a 16yds. road. In fact, if the space would have admitted of it, the road should have been shown 18yds. in width. Other road improvements are also necessary before the ground can be properly utilised for sewage disposal purposes. It is proposed to divert a portion of Stanley Road, placing it closer to the west side of the canal for a length of 333yds. In this case the road will be formed with slopes, and the gradient will be 1 in 117. At present it has an inclination of 1 in 42. The road is intended to form the approach to the new destructor which is proposed to be placed near the bridge which carries Stanley Road over the canal. Gazeby Lane, between the roadway and the canal, is to be raised so as to give an inclination of 1 in 26, supported by retaining walls, with archways or subways under the road for connecting the northern and southern portions of the site. A new bridge of brickwork and masonry will be necessary to carry this road over the Bradford Beck. It is also very desirable that a new bridge should be made over the canal near the "Venture" Inn, and it has been suggested that the Canal Company and the Corporation should contribute equally towards the cost, but as the negotiations between the two bodies are not yet completed, the construction of the bridge has not been provided for in the present estimate. The level of Gazeby Lane will, however, be kept up to suit the level of the new bridge whenever it is made. In addition, the two outfall sewers from Bradford will require diverting and extending to the new works. The intercepting sewer for the Heaton and Frizinghall drainage will also need to be extended to the new works, and it is proposed to convey the drainage from the Bolton Woods district by means of a

## A SYPHON UNDER THE CANAL.

All these will flow to the new works by gravitation, but the drainage of a limited area around Frizinghall Station and Dumb Mill, comprising about 128 existing houses and some 200 houses which will probably be erected on the building land belonging to Mr. B. Wood, will require to be forced up to the new works, or otherwise specially dealt with. It will also be necessary to divert the large water and gas mains which are at present laid under the footpath through Exley's field, and place them under the new roads. Another item of expenditure is £350, the half cost, for providing and fixing a lattice girder bridge for foot passengers over the Midland Railway, in lieu of the present objectionable tunnel at Gazeby Lane. Negotiations are now pending with the Railway Company, which is equally interested with the Corporation, in providing a new footbridge, seeing that their line at this point is to be doubled in width. The Corporation purchased the Dumb Mill estate, subject to a water right belonging to the Shipley Fields Mill. Water is taken from the beck above the weir behind the old Dumb Mill, and conveyed under Valley Road in a culvert to the new mill, where it is used for condensing purposes. The removal of the weir and lowering of the beck will necessitate the relaying of this channel to the new mill at a lower level. Finally, it is proposed to stop up the public footpath which runs diagonally across the fields near the chemical works from Gazeby Lane to the canal bank, nearly opposite Messrs. Holden's grease works. The total estimate is £40,000.

## Surveying and Sanitary Notes.

A SCHEME prepared by the Baths Committee of the Liverpool Corporation entails, if carried out, a cost estimated at £40,000, for public baths at the Pierhead, apart from a sum to be laid out in preparing the site by sinking steel piles and laying a bed of concrete, &c., some 5ft. in thickness, as a foundation. In the course of examinations of the existing building it has been discovered that its insecurity and insanitary condition are due to the percolation of water from the river through the Pierhead wall, which is spongy and pervious. The result is that a considerable part of the subsoil has been gradually washed away. The present swimming baths, too, are sunk to a depth of about 10ft. below the level of the Pierhead, with the result that at certain states of the tide the baths cannot be emptied. In the plans drawn up by the baths engineer the new baths will be some 2ft. or 3ft. only below the Pierhead level. The exterior of the building will be of red brick and terra-cotta. At the north end it is proposed to place a clock tower. It is also part of the design to construct on the roof a public promenade, 12ft. in width, extending the whole way round the building. This promenade will form the roof of the dressing-rooms, offices, and Turkish, Russian, and other baths on the top or second floor. Access to it will be gained from the entrance hall of the building or through the café, to which there will be a separate entrance in the north front, adjoining the access to the Landing-stage. The café it is proposed to locate on the first floor, and it will comprise, besides a café proper, a smoke-room 46ft. by 15ft., and a dining-room.

COLONEL J. T. MARSH, Local Government Board Inspector, has held an enquiry at Paul, near Penzance, into the application of the District Council to borrow £500 for the Newlyn drainage scheme.—Mr. O. Caldwell explained the estimate and plans, and that this was only an instalment of what really should be done at St. Peter's Hill. At present there was no system for the disposal of sewage, and house refuse was thrown out of the front door. The Inspector pointed out that they proposed to go to the expense of a drain to empty into an antiquated rough unventilated bolt. Mr. Caldwell said his instructions only went that far.—The Inspector thought it looked like spoiling the thing for a ha'porth of tar. It was evident that from where the scheme ended it was an incomplete one.—Mr. Caldwell replied that it was so, probably because of the poverty of the district.—The other portion of the scheme, that for draining Street-an-Towan, was explained, and the Inspector suggested carrying the outlet below low water-mark.

In the monthly report, submitted at a meeting of the Leeds Waterworks Committee, it was stated that there were 2506 million gallons of water in the city reservoirs, as compared with 2504 million gallons at the corresponding period. The committee decided to lay a new 22-inch main to deliver water from the filter bed to the two new pumping engines now being put down at Headingley. It was also resolved to construct an additional 18-inch main from the end of Stonegate Road to carry water from the pumping station to the Moortown reservoir. Instructions were given to get out tenders for the execution of this work immediately. The construction of the reservoir at Harehills was reported to be progressing satisfactorily, and a contract has already been let for the construction of a 30-inch main to carry water from this reservoir to the end of Meanwood Road.

MAJOR-GENERAL H. D. CROZIER, R.E., one of the Local Government Board Inspectors, has held a public enquiry at the Municipal Offices, Harrogate, respecting the application of the Corporation for a provisional order to repeal the Local Acts, and to enable the Town Council to borrow £3150 for works required in conveying a supply of mild sulphur water from

lands about 2½ miles south-west of the borough. The Corporation has for some time been making experiments with the springs at Beckwith, and having been successful in separating the iron water from the sulphur, has entered into agreement to purchase an acre or an acre and a half of land, as required, for £750 or £900. This supply of water is looked upon as a very valuable one for Harrogate, as it is rich in alkaline properties, and will be a great acquisition in connection with the new baths for bathing purposes, the treatment of skin affections, and ailments. The daily yield of the water is about 1200 gallons. It will be forced over Harlow Hill by means of a hydraulic ram, and conveyed to Harrogate in gun-metal pipes.

A LOCAL Government Board Inquiry was recently held at the Hove Town Hall, relative to the application of the Hove Urban District Council for sanction to borrow £1800 for purposes of street improvement and sewerage. It was explained that the money was required for the widening of Sackville Road, it having been previously widened in May, 1892. Sackville Road is not a main road, but a public thoroughfare repairable by the inhabitants of Hove. It is proposed to widen and sewer the road from the Railway bridge up to the Old Shoreham Road on the west side. The existing width varied from 17ft. 6in. to 19ft. 6in., and when widened the road will be 50ft. wide. The length of the sewer would be 645ft., the estimated cost of which, including ventilating shafts, would be £693. It was proposed to use concrete tubes.

THE Merthyr District Council has paid a visit of inspection to the new waterworks in process of construction at Upper Neuadd. Part of the work is being carried out by the Council, and part by Messrs. Holme and King, of Liverpool. The reservoir is intended to be of sufficient capacity to provide a supply of about 360,000,000 gallons a day. This quantity is in excess of what will be needed to meet the necessities of the Council's district, and it is computed that it will be able to furnish to other authorities outside their own district a daily supply of something like 2,000,000 gallons. The supervision of the work on behalf of the contractors is being done by Mr. Clinton Holme, while on the part of the Council it is being looked after principally by Mr. Harvey, their engineer.

LITTLE time is being lost in utilising the land opposite the Cardiff Cemetery, which has for some years been used for allotments. Plans have been submitted to the Plans Committee of the Cardiff Public Works Committee, showing the way in which the Bute authorities proposed to lay out that land. Plans were also submitted for houses to be situated in one of the prettiest spots around the Roath Park. The site, which is for about a dozen houses, lies between the Fair Oak bridge on the Rhymney line and the railway bridge which passes over the road just at the entrance to the lake section of the park.

THE Cardiff Corporation Waterworks Committee's meeting has confirmed the acceptance of the tender of Mr. T. D. Ridley, of Cardiff and Middlesbrough, for the extension of the filter beds at the Heath. The engineer (Mr. Priestley) estimated the cost at £10,548, and Mr. Ridley's tender was £10,114. Other tenders received were Messrs. Turner and Sons, Cardiff, £10,132; Messrs. Harrison and Co., Swansea, £10,277; and Mr. James Allan, Cardiff, £11,570.

THE Sanitary Institute has accepted the invitation of the Leeds City Council to hold the autumn congress and exhibition in Leeds next September. The congress will last for a week. The programme includes general addresses and lectures; sectional meetings for the reading and discussion of papers relating to sanitary science, engineering, Architecture, chemistry, meteorology, and geology; and conferences of medical officers, engineers, and sanitary inspectors. Visits are to be arranged during the congress to the waterworks, sewage disposal works, the hospitals,

and other places of interest to sanitarians. There will also be a health exhibition, containing all the newest forms of sanitary appliances and machinery relating to municipal and domestic sanitation.

THE Farsley Urban District Council having applied to the Local Government Board for sanction to borrow £14,700 for purposes of sewerage and sewage disposal, and also having applied for the appointment of an Inspector to make inquiry into the propriety of certain of the said works which are to be constructed beyond the limits of the urban district, Major-General H. D. Crozier, R.E., the Inspector, recently held the usual inquiry. The estimated expenditure on the proposed scheme is £14,700, viz.: £5770 on the sewage outfall works and £8930 on the general drainage scheme. For the outfall works it is proposed to purchase 13½ acres. In 1873 plans of a proposed sewerage scheme were prepared by Mr. Filliter, C.E., Leeds, but matters still remain as they were, the drainage at present being a primitive system of sanitation.

A MEETING of representatives of District Councils in the western valleys from Monmouthshire was held recently to consider the disposal of sewage of the valleys from Ebbw Vale and Nantyglo. Alderman W. H. Powell explained that, so far as the western valleys were concerned, the representatives at the recent conference at Newport were not decided, but wished to keep the matter open. The eastern valleys had withdrawn from the trunk scheme of the Monmouthshire County Council. The representatives stated that none of their Councils had pledged themselves to any scheme. It was unanimously resolved:—"That the surveyors and engineers of the various District Councils of the Western Valleys, in conjunction with the county surveyor (Mr. Tanner), consider the trunk scheme, and obtain as nearly as possible the cost of same and report to another meeting."

THE usual meeting of the Sanitary Inspectors' Association was recently held at Carpenters' Hall. Twenty-two new ordinary members were added to the roll, and Mr. Charles Seale-Hayne, M.P., was elected an hon. member. Mr. T. W. Crocker read a paper on "Nuisances from Certain Trades," and a discussion followed. Subsequently a conference on "Tenure of Office" was initiated by Mr. G. T. Dee.

THE annual meeting of the North-Western and Midland Sanitary Inspectors' Association was held at the Royal Institution, Liverpool, on the 10th inst., under the presidency of Mr. William Urquhart, of Crewe. The officers elected for the ensuing year were Dr. Francis Vacher (medical officer of health, Cheshire County Council), president; Dr. E. W. Hope (medical officer of Liverpool), Dr. Edward Sergeant (medical officer, Lancashire County Council), Dr. William Carter, J.P. (Liverpool), and Dr. George Reid (county medical officer, Stafford), vice-presidents; Mr. William Urquhart (Crewe), chairman of council; Messrs. Wm. Stansfield (Manchester), F. T. Poulson (Stafford), and Ernest Worrall (Penmaenmawr), vice-chairmen of the council; Mr. N. Coates, treasurer; Mr. H. H. Spears (Waterloo), secretary; and Mr. William Gleaves (Liverpool), librarian. The tenth annual report stated that the work and progress of the session were unexampled in the records of the association. The total number of members was now 213, as against 142 in the previous session, and the area represented was 87 distinct urban and rural sanitary districts, as against 48 in the preceding year. An amalgamation with the Staffordshire Sanitary Inspectors' Association had been effected. A library of standard works on sanitary and allied subjects had been established, together with a museum of sanitary appliances. At the close of the routine business, Mr. J. F. Burnett delivered a lecture on "Simple Methods of Water Analysis," his remarks dealing largely with the means of detecting contaminations in water.

### Varnishing Day at the Academy.

"I AM not aware of the limitations of the Royal Academy," said Mr. Whistler recently at the trial of Pennell v. Sickert, when counsel asked him if he knew that transfer lithographs were not accepted at that institution. We should like to share that delightful state of innocence with him, so far as Architecture is concerned at least. It would be better for our own peace of mind, and we imagine that of a good many others besides ourselves. How can we be innocent of the Academy's limitations, however, when "Architecture limited" is the very first thing that greets you at its doors this year? Written legibly on a large exhibit, what could be plainer?—except, indeed, it were written on the door-head itself. Such delightful satire, such uncertain humour there is in the phrase, that one is almost inclined to believe the picture was purposely accepted and hung to point a moral and to adorn a tale—the moral of modern Architecture, a tale of woe! No premeditated scheme could possibly have hit upon a more fitting title to describe this year's exhibition of Architecture than that. Nothing could be nearer the truth there than "Architecture limited"—and worse than the commonplace. "One gets tired of eccentricities and welcomes the commonplace as a relief," said an Architect friend of ours on varnishing day, and looked around for relief and found none, nothing but "Architecture limited" everywhere. Sad, indeed, those few brilliant exceptions which serve mainly to show of what poor stuff the rest are made. No saying concerning the Academy Architecture is more aggravatingly trite—aggravating, because it is so true, than that you constantly hear: "It is the worst I have seen yet." The repetition of the phrase gets tiresome after, say, a dozen years of it. We went, therefore, to this year's show firmly resolved to have nothing to do with such unpleasant things. We would look at the bright side mainly, even polish up—to the best of our abilities—the dull one. We would go placidly to work with a strong preconceived idea to bless. Nothing, we argued, could possibly pass the Hanging Committee but that which contained some merit either of drawing or design. If the latter, we would praise their wisdom, for surely Architecture should be first considered. If the former, we would improve our minds by studying the Artist's deft treatment of an unlovely subject, his clever handling of delicate effects of light and shade, his cunning in subduing fussiness and triviality. It is true that here and there in the waste we found such things. Such lovely creations as those by Mr. Wilson, illustrating his work at Welbeck Abbey for the fortunate Duke of Portland; such living virile work as that by Mr. Beresford Pite, illustrated by Mr. Joass; or again, Mr. Belcher's work by the same Artist, and some equally good drawings by Messrs. Nicholson, Corlette, Blanford, C. C. Brewer, and a few more; but with these, and say half-dozen others, the list is nearly, if not quite exhausted, the remainder falling as we had said, and with sorrow, pitifully below the commonplace, and the commonplace which is not relief. Personally we prefer eccentricity; it is at least amusing, if it does at times exasperate. Now we don't believe that this

sort of thing is due entirely to the indifference of Architects themselves, we prefer to put the blame, plumply, in the right quarter, viz., the Hanging Committee—that much-criticised body of men of whose sins, both of omission and of commission, it would take long to tell, extending, as they do, over the whole period that the Academy has thrown its light and shade over the aspirations of the Artist. It is an easy matter to question the discrimination of the Hanging Committee, but we must call it again to account. We cannot do otherwise with the evidence we possess at this moment at the Office of the Architectural Review—the evidence of rejected pictures. It would be a most entertaining and instructive thing, in proof of this, were we to publish a few "Academy

such a thing, it is better to say our Art is so little cared for, so ignored, that the effort itself would not be worth attention.

### Art of Plastering.

"PLASTERING, Plain and Decorative," by William Millar, plasterer and modeller, is a book to which—being compiled by a Craftsman—we would wish to give a cordial welcome; not only for its own sake, but also for the evidence it shows that there are still Craftsmen among us who have something of the old love for their Craft—men whose interest in their work is not solely confined to the necessary living it brings. Our modern life, with its spirit of unrest, has done much to destroy this feeling; but it has lately come to be

parallels" in our pages. The evidence would be overwhelming. Some of the most beautiful things we have ever seen—beautiful alike both in drawing and design, Architecture which the nation itself should be proud to possess—have been rejected for works that would disgrace an estate agent's window. Whose fault is this if it is not that of the Hanging Committee? With such proof you are almost inclined to think the Academy is wishful to prove that Architecture, once mistress of all the Arts, is indeed upon the town, fallen below the level of the streets. And this from the institution formed to foster and encourage the Arts! Perhaps, however, it is unfair to seek to convict the Academy of

more clearly understood that the best Craft, like the best Art, is not a matter of routine—the mere soulless labour of unthinking and unfeeling workmen, working simply for their hire. It is felt that to produce good work there must be intelligence and interest, untiring patience, and a love of the work for its own sake. In such fashion wrought the great Craftsmen of the past, whether in plaster, as did Vittorio, or in wood, as did Sheraton, or in iron, as did Huntingdon Shaw. To such as these work well done was its own reward. It is because this book seems to have caught some breath, however faint, of the spirit which animated the Craftsmen of old—some lingering echo of the great voices of the past—that it has a claim upon our sympathy. Any evidence

tending to prove the existence of a right spirit in the Crafts must always be to the Artist a source of gratification. The author, in his preface, tells us that this is the work of a lifetime, that he has felt the want of a practical book on plastering, and that he believes this to be the first complete one ever published. A prefatory note is contributed by Mr. G. T. Robinson, in which we learn under what adverse circumstances this book was written, and with what courage it was taken up again, after the manuscript and drawings had been destroyed by fire. A most interesting introductory chapter, giving a general history of the progress of plastering from the earliest times, is also written by the same hand, chiefly from historical material collected by Mr. Millar, who himself devotes his first chapter to the history of his Craft in the British Isles. After this first chapter we find two dealing with materials, and then chapters on such subjects as Lime Plaster, Fibrous Plaster, Decorative Ceilings, &c.; on such processes as modelling, wax and gelatine moulding, &c.; and, finally, one on tools and appliances. The book finishes with a most useful appendix, giving plasterers' memoranda, recipes, and glossary. The subjects illustrated are of unequal Artistic merit, but as illustrating the material or the process, rather than the design, they serve their purpose. Some are examples of elaborate Renaissance work at Venice or Fontainebleau; others of the wonderful work of the Moors in Spain; and others again show specimens of the work done in England and Scotland, such as that at Audley End. This book aims at being a complete and exhaustive treatise on the whole Art and Craft of plastering, dealing both with materials and workmanship; and not only with plastering as the term is generally understood, but also with such allied subjects as terra-cotta and concrete. Here may be found a wealth of information as to the processes used by plasterers at all times and in all countries, and the relative advantages of various materials for various purposes. The most valuable part of the book seems to be that in which the author, a practical plasterer, describes the technical details of his Craft, the proper preparation and use of materials, and the various methods of their application. Of less value are such chapters as the one on Rudimentary Geometry and Architecture, dealing with such subjects as the setting-out of various kinds of arches, the proportions of the orders, and different sorts of classic features, such as gateways, niches, pediments, and mouldings. Here the author appears to wander somewhat from his subject, to occupy himself more with the design than with the execution. This chapter, compared with the others, is necessarily, perhaps, incomplete: not enough geometry to enable the plasterer to set out intricate problems, not enough Architecture to give him an intelligent appreciation. These matters are dealt with more fully elsewhere. The edition of "Vignola," by Leveil, may be consulted with greater advantage for the proportions of the orders; while for the geometrical problems involved in the process of setting out elaborate details, numerous handbooks on geometry already exist, which are naturally more complete. While in a critical mood, we may say that we think the book generally is perhaps a little unwieldy and diffuse, and that it might be improved by the omission of everything (with the exception of the history) that does not strictly bear on the technical side of the subject. The author's enthusiasm sometimes leads him into such statements as those on pp. 522-3, on the elements of Architecture, which is a matter outside his province, and on Gothic mouldings, when he makes a statement which, according to Viollet-le-duc, is the exact contrary to the truth. Every man who writes from his own personal observation and experience is always interesting, and generally instructive, but not when he is simply retailing secondhand information. We are inclined to echo Mr. Robinson's desire that other Craftsmen may be tempted to write their "shop knowledge," for, as Viollet-le-duc once put it, a workman who knows his work is one before whom the Architect may stand, cap in hand, and learn what he can. The Artistic use of plaster work for

decoration has increased of late years, and interest in this material has grown with it. Modern requirements of speed and economy are found to be satisfied. The publication of this book is therefore opportune, and should help in diffusing a wider knowledge of the possibilities of the material. On its value as a textbook for young plasterers others can speak with greater authority, but we can safely say that to the Architect it will be found an interesting and valuable book of reference.

["Plastering, Plain and Decorative." By William Millar. Illustrated. B. T. Batsford, High Holborn, London, W.C.]

#### BUILDING AT BIRMINGHAM.

**BIRMINGHAM** is rapidly extending its borders. Previous developments have been chiefly within the municipal boundaries, but the population of the city is now fairly overflowing in almost every direction, and the districts immediately outside have been the scenes of an almost mushroom-like growth, both of manufacturing premises and residential quarters. The erection of new buildings is still going on with undiminished rapidity. Contractors are occupied to the utmost of their capacity, and coincident with this is a marked rise in the cost of building, which, within the last two years, has increased as much as 15 to 20 per cent upon the already high rates which had previously prevailed. In Edgbaston, where certain restrictions are imposed when the erection of houses is concerned, there is a large area of land ready for the builder, and the same may be said of Harborne, where similar reservations limit the growth of the district. A good deal of building is going on there, however, particularly in the conversion of houses into shops, as well as in the addition of new streets near the railway station.

#### BUILDING OPERATIONS

of an extensive character have been in progress for a long period on the Dudley Road side of the city, and stretching across to the Hagley Road as well as in the direction of Smethwick. The Gillott estate is "ripe," and in that vast district there is room for an enormous population. Streets of houses, chiefly small villas, are being erected, and it will not be long before the neighbourhood of City Road, which runs between Dudley Road, Sandon Road, and Hagley Road, is covered with residences. Several new thoroughfares running parallel with City Road are projected, and these will be intersected by other streets from the city boundary to Rotton Park Road. Balsall Heath has extended so rapidly of late years that very little land remains available, and when the open spaces near Cannon Hill Park have been utilised, the district, except in small isolated spots, will rarely require the services of the builder. In Sparkbrook, building operations on an extensive scale have been carried on for years. The intervening land, chiefly fields, between Stratford Road and Balsall Heath, near the boundary line, has been covered with rows of houses, and new thoroughfares are being cut from the neighbourhood of Anderton Road in the direction of the boundary, so that in time the whole of the area on the Small Heath side of Sparkbrook will be built upon. There is plenty of open land ripe for building purposes at Small Heath, especially in the Hobmoor Lane locality, and similarly a considerable development is in prospect at Saltley and Little Bromwich, where an elaborate growth has been noticeable within the last ten years. On the other sides of the city, like the centre, there is practically no room for extension. The main feature about the building enterprise in Birmingham is the steady increase in the number of residences, chiefly, of course, for the artisan and lower middle classes. Last year 1852 new houses and shops were put up, as compared with 1806 in the previous year, and about equal progress has been made during the first quarter of the present year. On the other hand, the erection of warehouses and shopping

has been unusually extensive, the number of such

#### BUILDINGS ERECTED LAST YEAR

being 247, against 197 in 1895, an increase of about 25 per cent. A curious feature of the growth of the suburbs is the decisive manner in which diverse interests have been concentrated in sharply defined localities. This is especially noticeable in the vast area comprising the parish of King's Norton and the parish of Northfield, governed by the King's Norton District Council. The entrance to Moseley is marked by a long row of comparatively new shops, the village "Green" has become merely an ornamental flower bed, and the site of the adjoining garden of recent times now contains seventy houses and shops, as well as the tramway depôt. On the other side of the road, the Moseley Hall Estate, with the exception of some ten acres surrounding the Convalescent Home for Children, is being prepared for building purposes, and already imposing roads stretching across to Cannon Hill Park have been planned. The process of development is seen in the fine residences of Chantry Road, which runs by the side of the estate, and the villas of a similar character in course of erection in Salisbury Road, which cuts through the grounds. The fields and gardens formerly existing on the Alcester Road have been largely covered with houses, completely uniting Moseley with King's Heath. On the far side of Moseley building operations are also steadily proceeding. Some hundreds of houses have been built, and others, chiefly on the Grange Estate, which was acquired last year and plotted for the erection of about 900 houses, are in course of completion. There is still room for development, and signs are not wanting that in the course of a few years Moseley, King's Heath, and Stirchley will so broaden as to ultimately unite and form one huge community, with Moseley as the "West End." In the parish of Northfield similar progress is being made. Several streets have been built opposite to "Kirby's Pool," and other roads are being laid out; while a little nearer Birmingham the Selly Grove estate, ranging from the hotel to the city boundary, has been developed within the last twelve months, and upwards of 130 artisans' dwellings have been built or are in process of erection. On the upper side of Selly Oak the land in Harborne Lane is also being

#### FILLED WITH HOUSES

for the working classes, and a similar enterprising condition is to be observed in the neighbourhood of the workhouse. As in other suburbs, so at Sparkhill, the development is due, in a great measure, to the operations of the Freehold Land Society, which has been responsible for the erection of some hundreds of houses. Now the society has acquired another estate near Moseley College, and the whole of that vast district will in time be built upon. Sparkhill and Greet are but a small portion of the parish of Yardley, but taking the hill at Sparkhill as the centre, there are within a radius of a thousand yards at least 13,000 inhabitants, and of that number it may be safely said that 10,000 are residing in houses erected during the last dozen years. The extension is chiefly in Sparkhill and Greet, where considerably more than half of the 450 or 500 houses erected annually of late years have been built. Hay Mills is a rapidly-developing industrial community, but the other villages of Acock's Green, Hall Green, Yardley, and Stechford are residential suburbs, and their populations are steadily advancing. Handsworth is another suburb which has made gigantic strides during the last five and twenty years. On the West Bromwich side the whole neighbourhood of the New Inns is being built upon very rapidly. Many new streets have been opened, and others are in course of construction; but there remains a vast area of undeveloped land awaiting the attention of the builder. That attention will be paid to it in the near future is certain, and it is estimated that 600 additional houses will be erected within a short radius of the New Inns during the next two years.

## In Istria and Dalmatia with a Camera.

By W. LAW BROS.

### II.—ARBE AND ZARA.

**T**AKING leave of the Peninsula of Istria, and sailing for a few hours across the Quarnero, brings you among the many islands which form a breakwater to the Dalmatian coast; and skirting along the low-lying island of Veglia, you see the lofty spire of Arbe, on the island of the same name, the first stopping-place in Dalmatia proper.

This island was for many centuries an important naval station of the Venetians, and during their almost incessant wars with the Turks, became a very important town. In the middle of the fifteenth century it was devastated by a pestilence, which destroyed nearly the whole of the inhabitants, and since that date it has never recovered its wealth, population, or importance, but lies stranded, so to say, its *raison d'être* gone, and without any inducements for settlers from outside to repopulate its deserted streets, which retain many rich and beautiful traces of the magnificent structures in which its inhabitants delighted

borrowing our pantomime from Florence, do not suspect that, in adopting the lean and slippered pantaloons, we are perpetuating a Florentine mediæval political representation of the great Republic of Venice.

I could have wished to linger among the deserted streets of Arbe, but time did not permit, and, having obtained a few snap shots, was obliged to proceed (the boat only calling at very irregular intervals) to my next stopping place, Zara. This is the capital of Dalmatia, and boasts about 12,000 inhabitants, and is celebrated among lovers of creature comforts for its liqueur Maraschino, and among lovers of the Fine Arts for its graceful Venetian Architecture. You naturally turn your steps towards the Cathedral on first landing, and find a fine thirteenth-century front, which might have come from Pisa or Central Italy, but under such unfortunate surroundings, so far as photography is concerned, that from the small piazza in which it stands it is impossible to get in the whole of

CHURCH TOWER, ARBE.

PORTA MARINA, ARBE.

in the days of their prosperity. It is in point of fact a fourteenth-century town, full of delightful corners, in which you can linger with very great pleasure and profit, tempered with regret at seeing these busy haunts of men now silently crumbling into dust from neglect and decay. The accompanying illustrations show the fine Venetian thirteenth-century tower, which, in my opinion, may well vie in beauty of proportion and chastity of style with the more florid and highly decorated tower of Giotto, at Florence. If one may venture on a criticism, it is that its Art in duplicating the windows in each successive story is a little too apparent. Be that as it may, you rarely meet with a tower of more beautiful construction or more pleasing design.

The Piazza dei Signori also gives an idea, although an inadequate one, of the way in which these old fourteenth-century citizens vied with each other in decorating their town mansions. The water-gate, through which you arrive and depart, is also an interesting structure. Very rough and crude in construction, it bears conspicuously over the gateway the emblem of Venetian sovereignty—the lion of St. Mark—whose effigy may be seen over many a public building in Greater Venice. The piantaleone, or planter of the Lion, became, indeed, a favourite figure of speech for Venice, and under this name political rivalry delighted to represent Venice as a decrepid old man; and we Anglo-Saxons, in

the front. Under these circumstances there are two courses only open—to take a portion correctly, or to take in the whole, but at such an angle that violent foreshortening and distortion are inevitable, and give a painful impression rather than a pleasurable one. For myself, I chose the former. It is rarely that English Architects have a chance of showing their skill on the Continent, and I note with pleasure that the effective modern tower of this Cathedral is the design of our recently-elected R.A., Mr. Jackson, whose valuable book on Dalmatia is deserving of study by all those who are interested in this out-of-the-way country. Passing into the interior of the Cathedral, we find a somewhat simple but effective building about a century earlier than the west front. At the east end is a very interesting ciborium, dating from 1332, with elaborately carved columns, which, together with the stalls, show in their blackness a very strong contrast with the white stone walls and roof. Under the choir is a curious early crypt with pointed arches, which contrast somewhat curiously with the later semi-circular vaulting of the roof of the nave and choir.

But the Cathedral is by no means the

only building of interest in Zara. The ninth century Church of St. Donato is an octagon building, very much on the same lines as the central portion of Charlemagne's Church at Aachen, and a visit to it shows that the foundation consists entirely of early Roman monuments. Here are fragments of Roman altars, capitals, bases, cornices, all jumbled up together, and forming a mass of foundations on which the ninth-century builders laid their first corners of masonry. The tympanum of the door at St. Michael's has a curious archaic representation of the patron saint, who is performing his two functions simultaneously: with one hand he is weighing the souls of the departed, and with the other, fighting a demon, who, however, is such a little one, that much glory can hardly have been gained by the conflict, unless the virulence of the demon was in inverse proportion to his size. The fight, however, can hardly have been carried on without a loss of that impartiality which should

WEST FRONT OF CATHEDRAL, ZARA.

be in fullest force while the weighing of the souls was being carried out.

At St. Simeone's Church the superb silver ark of the saint, one of the most beautiful pieces of the silversmiths' craft of late fourteenth-century work, is to be seen; but as a copy of this is exhibited in the Museum at South Kensington, it is unnecessary to do more than mention it here.

Turning to the secular buildings, you notice the watergate, or Porta di Terra Firma, of which an illustration is given. This was

INTERIOR OF CATHEDRAL, ZARA.

originally a Roman work, but rebuilt by the Venetians in 1543, as recorded by its inscription, in that tasteless style of bastard Romanesque which causes the monuments of that date to be such eyesores to the lover either of Classic or Gothic form; it is, however, a very typical specimen of its style and time.

Of Roman work little remains: the successive invasions of Goths, Hungarians, Venetians, and Turks have destroyed nearly all traces of the old Roman city of Jadera, and to-day the most conspicuous relic of the Imperial city is the solitary Corinthian column which stands in the Piazza della Erbe, and is all that remains of the Forum. Even this relic has suffered the degradation of serving as a pillory, and at the present day are still to be seen the chains to which malefactors were fastened, and which have worn deep grooves into the stone across the fluting of the Roman work.

The varied interests in and about Zara are by no means exhausted by a visit of three days, and we therefore push on further south to Sebenico and Trau, which will form the subject of my next article.

The new Technical College in George Street, Paisley, plans of which have just been passed at the Dean of Guild Court, will cost £20,000. The building will be three stories in height, and is designed in a simple style of Italian Classical Architecture.

The Glasgow Tramways Company has decided that an experimental trial of the overhead trolley system should be recommended for the Springburn route. It was understood that in putting forward this recommendation at the next meeting of the Corporation, the Committee should point out that by adopting it the city might get over the difficulty of street lighting by electricity, as both objects, lighting and traction, could be worked in conformity from the common station situated as centrally as possible.

## THE ORIGIN AND DEVELOPMENT OF RENAISSANCE ARCHITECTURE IN ITALY.\*

(Continued from page 158.)

By C. B. HUTCHINSON, A.R.I.B.A.

THE earliest structure of which any record exists is the Ark of Noah, the dimensions of which were 300 cubits long, 50 cubits wide, and 30 cubits high, or in length and breadth 300 to 50 cubits, or one-sixth, and length and height 300 to 30, or one-tenth, thus forming proportions identical with those of a human body floating as the Ark itself would on the water. To show the importance placed on a system of proportion employed in a sacred edifice, we find in the building of Sienna Cathedral, that on February 14th, 1321, the work which had been begun was stopped because the proportions were not set out according to ancient rules, and a commission appointed to inquire into the matter. Brunelleschi's Churches show a study of Classic detail gained probably during his several visits to Rome, and a careful reproduction of its features and mouldings. It is strange how in both Churches, S. Spirito and S. Lorenzo, he places a small entablature on the top of the capitals, instead of springing the arches direct from their capitals. No doubt this is correct according to an "order," but an arcade is not an "order," and this unnecessary feature should be left out. The first building in which it was so is the Palace of Diocletian at Spalato, in Dalmatia, erected in the third century, and yet it was not again followed till the fifteenth century. Brunelleschi's great work, however, was the completion of the Dome cupola to the Cathedral at Florence, which was commenced in 1420, and not quite completed at the time of his death in 1444. The construction

of a dome of such immense size had never been before attempted by the Italians, and many were the methods suggested for its construction. It was not thought advisable to entrust so great a work into the

He determined to get it all into his own hands. His method of procedure is probably well known. He pretended to be very ill, and so Ghiberti was left in sole charge, who soon found out that he was quite unable to carry on the work, and then Brunelleschi stipulated with the Church authorities that he would finish the dome if he had the responsibility placed in his hands alone. These two men had before competed for the bronze gates to the Baptistry at Florence. Here Ghiberti was distinctly the finest Artist, and so had the work entrusted to him. The dome of the Cathedral is 136ft. across and 293ft. high, the total height to the top of the cross being 385ft. His instructions were that "it should surpass everything that human industry and human power had conceived of the great and beautiful." Brunelleschi had already, in his earlier days, been to Rome and studied the Pantheon, and his boast was that he would now take that dome and raise it in the air at Florence. He again goes to study the construction of this wonderful Roman dome, but the one he builds is different in having two separate domes visible outside or inside, instead of the single hemisphere of the Pantheon. There are many different kinds of domes. In some Byzantine Churches it is merely an internal stone roof, with a wooden roof outside, similar in idea to our vaulted Gothic Cathedrals. Or it may be a single semi-circular vault, as in the Pantheon and Sta Sophia at Constantinople, the thinnest part of the masonry being at the apex and thickening towards the sides as the pressure increases; and merely cemented over on the outside to exclude the weather. This method was adopted in several Churches in Jersey. Or it may have two separate internal and external domes, as at Florence and St. Peter's at Rome, which forms a far finer feature when seen from the outside. St. Paul's has an internal dome with a false dome-shaped roof outside, and an internal brick cone between these two to carry the stone cupola on the top. A dome may be circular on plan, with a circular dome above, as at the Pantheon. Or a square on plan gathered over at the by what are termed pendentives to a circular dome, as we see at Sta Sophia, or St. Mark's at Venice. Brunelleschi's dome is an octagon on plan, with octagonal domes above and massive ribs at each angle to bind the inner and outer domes together. Michael Angelo's dome at St. Peter's is on the same lines as Brunelleschi's, but circular instead of octagonal.

PORTA DI TERRA FIRMA, ZARA.

hands of one man, and so Ghiberti was appointed as joint Architect. Brunelleschi soon saw that Ghiberti was of no use, and did not understand how to construct this dome.

\* A Paper read before the Oxford Architectural and Historical Society, on February 9th, 1897.

A REMARKABLE DOME, almost as large as the Pantheon, was built in 1860 at a village in Malta, and was practically carried out by the local mason. It was erected without scaffolding, by the simple expedient of notching each stone on to the one below it by setting back part of the surface a few

inches, thus preventing the voussoirs from sliding. The second great pioneer of the Renaissance was, as already stated, Alberti, 1398-1472, consequently he was twenty-one years younger than Brunelleschi. He was a Florentine of noble birth and liberal education, considerable knowledge of Roman literature, and he adopted Latin usually for writing and often for speaking. He studied the works of Vitruvius, and then wrote his own book on Architecture, entitled "De re Aedificatoria," upon the same lines. His Church of S. Francesco at Rimini, which was never completed, is a good example of refined Classical Architecture adapted to suit the Mediæval requirements of that time. A typical example, and one of his best, is the Church of St. Andrea at Mantua, and is interesting as having set out the lines for planning a Church, which were followed for the next two centuries afterwards. It resembles Brunelleschi's San Spirito, at Florence, in several points, being in the form of a Latin cross, twice as long as its breadth, and its width one-sixth its total length, but it has no columns, there being only arched openings in the nave walls for the series of small chapels ranged along the sides, which are alternately a square on plan and a square, by the length of its diagonal, a form of proportion so often noticed during this period. There are lofty pilasters on the nave walls carrying an entablature such as is seen at St. Peter's, with a coffered semicircular vaulted roof inside, the height to the top of the cornice being the width of the nave, thus forming a perfect cube for the space where the nave and transepts cross, and where the High Altar with its baldche usually stood, the cube being a form regarded from the earliest times with peculiar sanctity. The west front has four lofty pilasters carrying an entablature and pediment, the remaining space being cut up into smaller features; it is, however, all guided by certain lines of proportion. The whole Church is impressive from the proportion of the design, and it is all simple, elegant, and refined, and a good example of the earlier period of the Renaissance. It may be compared to the simplicity of our Early English Gothic, contrasted with the succeeding Decorated, or the over elaboration of the Perpendicular. Renaissance palaces are on the lines of Roman ones, with the atrium and impluvium, and the internal cloistered courtyard with its fountain, such as we see in Pompeii. The Roman palaces have the traditional portico with its column and entablature; but at Florence the Etruscan element again shews itself in its massive palaces with their rusticated masonry for the ground floor stories. Alberti died in 1472, and at that time the Renaissance was well established as an Architectural style in Italy. Its two great forerunners had now passed away, and yet a whole century more elapsed before Renaissance Architecture was seen in England; though there was a distinct tendency in that direction in the detail of the later Tudor work. The first at all complete work was at Caius College, Cambridge, and this was designed by a foreign Architect, and is not of a pure form in its detail. It was not till a century and a half after the death of Alberti that the first large pure Renaissance building was erected in England, namely, the Palace of Whitehall, built in 1619 for James I., the drawings for which are in Worcester College Library. It was soon, however, universally adopted by such men as Wren, Gibbs, Hawksmoor, and Vanburgh, and many beautiful buildings erected, such as St. Stephen's, Walbrook, the Radcliffe Library, and St. Paul's Cathedral. Most of our Architects of this period went to Italy to study, just as our Sculptors and painters did, and still do, but it is remarkable that the greatest of them all, Sir Christopher Wren, never went to Italy. Let us now consider the last of the three great pioneers, namely, Bramante (1444-1514). The lines upon which he worked were similar to those of Alberti; but a further development, especially in richness of detail and the introduction of Sculpture. Bramante had the privilege of working under Mantegna at Mantua, where Alberti also for some time resided, and built

the Church of St. Andrea, already mentioned, which he would have carefully studied, and the not far distant Roman remains at Ancona. Rimini and Verona would afford good study of Classic Architecture, though he went to Rome as well at an early age. Art, in all its branches, had wonderfully developed by this time; Masaccio, Perugino, and Leonardo da Vinci were in the prime of life. Donatello was an old man, and had completed his life's work; and Luca della Robbia was producing his beautiful terra-cotta, which Bramante often used in his buildings, such as the Pazzi Chapel, at Sta Croce, Florence. The parallel lines taken by painting and sculpture, or their contemporary development, is well shown by the carved arabesques on the façade of the Certosa at Pavia, and those painted by Raphael in the loggia of the Vatican. They are called "grotesques," and are so named from the decorations which were discovered in the "grottos" of the Baths of Titus at Rome. It is too generally supposed that Roman Classic work is confined to definite forms of Sculpture, and mere Ionic or Corinthian capitals.

#### THE CARVED WORK

at Diocletian's palace at Spalato, or at Baalbek and Palmyra, or the used-up capitals at St. Lorenzo, at Rome, show great freedom of composition, and closely approach Renaissance carving. Bramante's Church of S. M. delle Grazie, at Milan, contains some rich detail, and several new forms, such as the candelabrum-shaped pilasters, such as are so noticeable at Pavia with most elaborately carved capitals. Another feature is that of an arch with two concentric archivolt with carved medallions between, first used by Bramante, and so often emphasised in his designs. A typical and very beautiful work of Bramante is the small octagonal sacristy to the Church of S. M. Presso San Satiro at Milan, 1474. It has pilasters in each angle, covered with delicate arabesques and richly carved capitals. The frieze of the cornice is taken up with children singing and playing, full of life, vigour, and beauty, evidently inspired by those of Donatello at Florence. In the centre of each side is a medallion, with a head in high relief. The upper cornice contains another series of children, but somewhat smaller in size. The whole work is of pure Classic detail, of great beauty and refinement, and a good example of the power and chasteness of

#### BRAMANTE'S WORK,

and illustrates the full development of the best period of Italian Renaissance. The latter part of Bramante's life was spent in Rome, and his buildings here are of a simpler type and far less ornate as regards Sculptures than his buildings in Lombardy. The Cancellaria, the Pal. Girand, the cloister of S. M. delle Pace, and the beautiful tempietto at St. Pietro in Montorio are typical examples; they have refined detail and mouldings, but the design itself is of a simple type. This was due to his having studied systems of proportion, and depending upon this element rather than upon any ornateness, and all the leading lines will be found to be based upon a pre-arranged plan often taking the square with regular subdivision as the motive, or some fixed proportions for all its lines and features, such as guides Greek designs. A good example is in his design for St. Peter's, in which all the leading lines were proportioned as 1-2, 1-4, 1-8, 1-16, or a progressive ratio of 1-2. But, as Michael Angelo said, "proportion comes from not only having a compass in your hand, but also one in your eye." And now a few words in conclusion. We have seen how the Artists of the Renaissance period began by study of Classic works, and so gradually absorbed this material and evolved a new style. Nature seems to have poured out a lavish profusion of gifts upon them, and in some cases something beyond talent, but genius, that power which "cometh not by observation," but is a Divine gift. It has also been defined as "the infinite capacity for taking pains." A mind to which nothing is too great, or nothing too small to be beyond the limits of its comprehension; like Nature herself, in which the microscopic animalculæ

are perfect organisms, and yet the stars themselves revolve in orbits of untold magnitude with mathematical accuracy. These Artists, though brought up in certain schools, yet struck out their own individuality afterwards, for surely "there's a Providence that shapes our ends, rough hew them as we will." An early Raphael is almost identical with a Perugino, or a later one shews the influence of Andrea del Sarto or Fra Bartolomeo, and yet none equal Raphael. L. delle Robbia derives his motives from Donatello and yet is different, and in the case of Nicola Pisano, Cimabue, or Brunelleschi, the personality is even more distinct from their predecessors. These men took the dry bones of classic Art, clothed them with flesh, and imbued them with a new life. Mere copying of bygone Classic precedent may be good in its way, and beautiful as an Academic study, but it is "faultily faultless, icily regular, splendidly null," for it lacks that one essential but indefinable quality, a living spirit. It is only the alphabet of Art, and lacks meaning till these letters are put together to form words which convey an intelligible meaning. It was to Nature herself that the men of this period went for inspiration, and for those higher qualities which are beyond mere technical study, for "there are more things in heaven and earth than are dreamed of in our philosophy." The handiwork of Nature is reproduced in marble under the hands of these Italian Artists, and its higher qualities of power, dignity, beauty, and unerring truthfulness their guiding inspiration. Art cannot be a mere Archaeological reproduction, but must be guided by these principles if it is to be a living Art, and be equal to the duty to which it is called, namely, to exercise a refining influence.

THE Lighting Committee of the Liverpool City Council has decided on the extension of electric lighting, at a cost of £22,000.

THE foundation stone of St. Michael's Church, Southfields, Wandsworth, was laid recently. The sum of £5000 had been subscribed by all classes in the district.

PROFESSOR BANISTER FLETCHER is designing the huge grand stand Mr. Maskelyne intends to erect in St. Paul's Churchyard on the site now occupied by the warehouse of Messrs. James Spence and Co.

MR. and Mrs. T. Wrightson, Norton Hall, have offered to defray the cost of a peal of bells for Thornaby Parish Church. It is proposed to erect a belfry and spire to the Church at a cost of £950. The bells will cost about £500.

A NEW school for boys was recently opened in the parish of St. Paul, Truro, and more convenient buildings are being erected in the place of the British Schools, which are unsuitable. When this is completed the supply of schools for the city will be amply sufficient.

THE recently-erected tablet to the memory of the late Field-Marshal Sir Patrick Grant was unveiled by the Duke of Cambridge, at the Royal Hospital, Chelsea, a few days ago. The tablet is placed in the corridor south of the chapel, and under the bust is a record of the actions in which Sir Patrick Grant took part.

WHILE excavating in Silent Street, Ipswich, in order to lay down new water-pipes, some workmen found the bones of seven men. The skulls were in excellent preservation, and as hard as flint, but the remaining portions of the skeletons broke during disinterment. The site of the discovery is near where the old priory stood, and Cardinal Wolsey is said to have lived there.

AN estimate, prepared by Mr. Derry, the Leeds City Accountant, has been submitted to a meeting of the Corporate Buildings Committee, and shows that for the year ended March 25th last the sum of £976 had been expended upon the Judges' Lodgings, £3360 upon the Town Hall, £2754 upon the Municipal Offices, in addition to £2126 spent upon electric lighting. The estimated expenditure for the ensuing year is as follows:—Judges' Lodgings, £504; Town Hall, £4200; Municipal Offices, £2400; and upon electric lighting, £2250.

### SUGGESTION FOR THE WEST CENTRAL IMPROVEMENT SCHEME.

By H. V. LANCHESTER.

THE various schemes that have been before the public and the London County Council for the relief of the traffic in the congested portions of the Strand, Chancery Lane, and other thoroughfares of the W.C. district have, in my opinion, all been conceived in a spirit lacking boldness and grasp, and consequently display a triviality which results in the expenditure of considerable sums in patchwork schemes, when a really effective and broadly-treated improvement could be effected at a not disproportionate outlay. For instance, one of the leading ideas of the improvement is to rid the Strand of the continual block created by the traffic from Waterloo Bridge to the north of London crossing that going east and west. This can only be effectively done

ages in leading thoroughfares for the Patent Office, King's College, and other buildings of a public or semi-public character, is one of sufficient importance to deserve consideration. The scheme has the additional recommendation that it might be carried out in three or four separate instalments, each bringing considerable alleviation to the present congested state of the traffic, and the whole forming an improvement that, both practically and architecturally, may fairly be considered as second to none that have hitherto been carried out in the Metropolis.

A FREE picture exhibition was recently opened at the 'Public Hall,' Canning Town. Some 200 pictures were on view, including specimens of Lord Leighton, Mr. G. F. Watts, Mr. Briton Rivière, Sir E. Burne-Jones, Mr. W. Holman Hunt, and Mr. H. Herkomer. Among those who lent pictures were Sir James

SUGGESTION FOR THE WEST CENTRAL IMPROVEMENT SCHEME.

by carrying the one route by a viaduct over the other, to which arrangement the levels fortunately lend themselves. The suggested bridge, starting from the Waterloo Road and continued over the Strand, would relieve Waterloo Bridge and this thoroughfare of the whole of the traffic from South London to the Northern Railway termini, while the suggested road from Holborn Circus to Cambridge Circus would both assist in distributing the traffic from the south and form a new and direct main artery between the City and West End, to the great relief of the narrower parts of Holborn, the Strand, Long Acre, and other streets at present taking this traffic. The only other road required to complete this improvement would be the spur-street passing over the ground (most of which is now cleared) between Wellington Street and Lincoln's Inn Fields, forming a new route for local traffic between the Strand and Holborn. Most of the property through which the proposed roads pass is old and dilapidated, and but few blocks of importance would require to be scheduled, while the advantage of providing important front-

C. Lawrence, the Earl of Jersey, the Countess of Pembroke, Mr. Cuthbert Quilter, and the directors of the South Kensington Museum.

IN St. Mary's Church, Haggerston, is an organ with a past. But that will be its only claim to attention unless the vicar is able to raise some £80 or £90 to cleanse it from the dust of two centuries and make some needful repairs. It was originally built to the order of Charles II. for St. George's Chapel, Windsor, by Father Smith, renowned as an organ-builder, and some sixty years ago it was purchased by a vicar of the Church which now boasts its possession.

THE Nelson Wesleyan Circuit has resolved on putting up new chapels and schools where necessity demands. In the Bradley district a new chapel and school are to be erected, to cost about £4000, to hold about 600 persons. Land has also been secured in the Barkerhouse Road district, whereon a new school-chapel will shortly be constructed, with a similar holding capacity. In Barrowford a new Sunday school is to be constructed to hold about 800 children adjoining the new Wesleyan Chapel.

### Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

April 28th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

DR. I. F. J. SYKES, D.Sc., Lecturer on Public Health at Guy's Hospital, has prepared an important report with regard to encroachments upon open spaces about buildings. He points out that in the London Building Act, 1894, although by Section 40 it is provided that a new domestic building, with a habitable basement, should have an open space of not less than 100 square feet, old houses possessing yards, areas, or open spaces at the back or front, or both, are being rebuilt in such a manner as to entirely cover the whole ground area two or three stories up, leaving not a particle of open space, not even a shaft for the purpose of allowing the drainage to discharge in the open. Hence the health conditions of domestic buildings in London would rapidly become worse, and the bye laws, regulations, and directions of the County Council and the sanitary authorities, which are all devised so as to cause drainage to be excluded from or to be placed outside of domestic buildings, were rendered useless by a Building Act, which enabled a domestic building to embrace the whole of the drainage of the premises within its external walls. The matter were an even more serious aspect when considered on a wider basis. The words "open space" originally bore the common meaning of ground space, to most persons they still bore that common-sense meaning, and Parliament had attached that meaning to the words in the Open Spaces Acts. But in the later Buildings Acts the provision of open spaces had successively been lifted from the basement to the ground floor, thence over the ground floor to sixteen feet above the ground level, and in due time might be made by future Acts of Parliament to ascend higher, so that eventually a house might be held to have supplied the necessary open space on the roof top instead of at the ground level. It is only by tracing the result to its logical conclusion that the past, present, and prospective perversion in the Building Acts of the meaning of "open space" can be fully understood, and the seriousness of the position realised.

THE British South Africa Company's new hospital at Gwelo will be opened early in June. The building is nearly finished, and will be in habitable condition by the time the three Nursing Sisters, who leave England on May 1st, arrive at Gwelo to take up their hospital duties among the Europeans and native miners in the district. The Bulawayo Hospital, built in memory of the victims of the Matabele campaign, has raised the standard of hospital construction in Mashonaland, for it is an extremely comfortable building. Until this hospital was put up, the sick of Bulawayo were treated in thatched, unburnt-brick huts, while Kafir patients were nursed and Sisters accommodated in native huts.

IN luxuriance of imagination archaeologists and mining experts run one another pretty close. Visitors to Margate this Easter may possibly have been lured into visiting "The

Grotto," to which we referred in a recent issue, and they need not grudge the sixpences charged for a peep into this strange subterranean chamber. Eminent authorities have quite decided that the cavern is at least a relic of Roman times, and certainly not less than 2000 years old. The cement was identified as corresponding exactly with that used to build the Pharos at Dover. Unhappily for all such theorists a couple of unpatriotic citizens have revealed the truth in the local papers. One of them knew quite intimately the noble Roman who constructed the grotto. He was a bricklayer, and a disused lime-kiln served as the field of his operations. The other asserts that his wife's uncle, Bowles by name, had the chalk dug out for burning, and that his brother-in-law carted the shells from Sandwich about seventy years ago.

MR. W. H. BREWER in a letter in the Daily Graphic on "The Nun's House" says:—"It has been proposed to secure that very picturesque old mansion called 'Eastgate House,' at Rochester, for the Corporation of that city. There are several reasons why this should be done. In the first place, the building is quite a gem of Tudor domestic Architecture, and is one of the few old-town houses left in the city, which, half a century back, was rich in such examples. Not only is this the case, but Eastgate House has become intimately associated in the minds of Englishmen with the recollection of Charles Dickens, as it is usually presumed that what he describes as 'Miss Twinkleton's establishment for young ladies,' called 'The Nun's House,' in 'The Mystery of Edwin Drood,' was inspired by Eastgate House. An exceedingly quaint and pretty feature of the building is the staircase turret projecting at the side, roofed over very quaintly with a gable, which gives the strange idea of having been taken from some other part of the house and clapped on accidentally. It is certainly much to be desired that this interesting building should be preserved."

WINCHESTER Cathedral organ is being reconstructed, with considerable additions and improvements, by Mr. Henry Willis. It was originally built by him for the Great Exhibition of 1851. Dr. Wesley, who was Cathedral organist at Winchester at that time, admired it so much that he induced the Dean and Chapter to buy it, and the restoration of the instrument on which he played for sixteen years will be a very fitting memorial of that distinguished musician. As it stands the organ is not so complete as it was originally built, and the parts are not perfectly balanced. One object of the reconstruction now undertaken is to redress this inequality by increasing the number of solo stops and improving their tone. But one of the greatest improvements will be the application of pneumatic action, with the best modern improvements, to the pedals and to the four rows of keys.

THE annual spring visits in connection with the Architectural and Building Construction Classes of the Glasgow and West of Scotland Technical College were made a few days ago—the places selected for special study this year being Edinburgh and Chester. The visit to the former city took place on Monday, the 19th inst., when a party of about thirty students was conducted by Professor Gourlay, who had made arrangements for studying the more important works of Architectural interest—ancient and modern—in Edinburgh, including St. Giles's Cathedral, St. Mary's Cathedral, St. Margaret's Chapel in the Castle, and the McEwan Hall, while the Museum of Science and Art received much attention in respect of its interesting collection of Architectural casts and other remains. The visit to Chester was made under the guidance of Mr. James Lochhead, and extended over four days, which time was principally occupied in studying by sketching, measuring, and photographing in and about the Cathedral, St. John's Church, and the numerous half-timber houses and fronts with which the city abounds, and of which the time at disposal only permitted too brief an examination.

BRUSSELS Exhibition, which opens shortly, bids fair to prove a draw in the most comprehensive sense of the word. A word or two with reference to the Exhibition buildings may be of interest. The granite of the country is admirably adapted to the construction of the monumental portico which ushers the visitor into the vast hall, 1200ft. in length, constituting the main building, and crowned by a dome. From this central edifice accessory halls stretch away to the right and left to a distance of 220 metres. The whole block embraces an area of a million superficial feet, and is framed by a landscape which nature and Art have alike contributed to beautify. In conjunction with the erection of the Exhibition buildings a nobly-devised avenue is in course of construction, which serves as a setting for the whole, and further connects the Parc du Cinquantenaire, or site of the main building standing in Brussels, with the historic park of Terveuren, a village five miles away. The Avenue de Terveuren has been designed with a lavish regard to the various means of locomotion to which two-legged beings may have recourse. Trees are planted on either side, and the avenue itself is divided longitudinally into five sections, along which one may respectively walk, ride, drive, cycle, or fly through space in an electric tramcar.

A PECULIARLY attractive feature of the Exhibition is the reproduction, under the name of Bruxelles-Kermesse, of a conglomeration of quaint old-fashioned shops and dwellings, modelled upon the buildings which still existed in the first half of the century, when picturesque façades, small green window panes, low doorways, and casual angles and corners gave the charm of unexpectedness to the Architecture of the day. Here we see again the fantastic badges with the still more fantastic Flemish legends environing them, that gave such individuality to each separate shop and drinking booth, while to render the illusion still more complete, the residents and promenaders are attired in the costumes of 1830. As regards the revival of an ancient part of the town, it must not be forgotten that in the real every-day Brussels, in the lower part of the city, the visitor may see a living and lasting presentment of the Architecture of the fifteenth and sixteenth centuries that nothing can surpass, in the beautiful Grande Place, with its world-renowned Gothic Hôtel de Ville and Maison de Roi, hovering between the Gothic and the Renaissance, and its ornate houses of the guilds, with their symbolical and decorative façades. The entrance to Bruxelles-Kermesse takes the form of a faithful reconstruction of the celebrated triumphal arch, designed by Rubens in honour of the arrival of the Archduke Albert and his wife Isabelle, while the houses follow the lines of those which composed the old quarter of the town known as the Marché au Beurre. Some sixty or seventy of these are utilised as cafés, restaurants, brasseries, and establishments for the sale of what the Germans call "Galanterie Waren." Others are reserved for the exercise of industries and crafts peculiar to Brussels, such as lace making, carpet weaving, &c.

"It is reported," writes a correspondent, "that the contract for the warming and ventilation of the new Liverpool museum buildings had been let to an outside firm. Of this I would be the last to complain had it been secured in competition, and had Liverpool firms, who are quite as well able to plan and carry out the work, been asked to tender; but such was not done, and I can hardly think that either the Library Committee or the Council was aware of this fact. I in no way wish to claim that Liverpool municipal work should be given to Liverpool firms, but I certainly claim that they should have an opportunity of tendering, and, everything else being equal, should have the preference, seeing that they are ratepayers and employers of local labour. It may be pertinent to ask—How is it that a very minor contract has been settled, when the main contract for the building has not yet been decided upon?"

THE London County Council has been adding to the attractions of Waterlow Park during the winter months. One novelty is the construction of a waterfall, crossed by a bridge, between the upper and lower ponds. But either the supply of water is inadequate to furnish the necessary motive power, or something has gone wrong with the works. The miniature Niagara is certainly not a success at present, but rather a succession of stagnant pools at different levels. One improvement the County Council might profitably contemplate is an addition to the refreshment-room accommodation. The small portion of Nell Gwynn's historical mansion—Lauderdale House—falls considerably short of average requirement.

A NEW ZEALAND native wharfe, or dwelling-house, that has been lifted bodily from amidst the scenic grandeur of Wairoa, now stands in the grounds of Lord Onslow's country seat. The walls of the wharfe are of rough slabs about 6ft. high, and the roof, which overhangs them rises sharply to the ridge-pole 20ft. from the ground. The interior is 15ft. square, but the side walls and roof project 4ft. beyond the entrance, forming a sheltered portico the width and height of the house. The front walls end in two large-sized panels, bearing huge, leering figures with defiant, protruding tongues and iridescent eyes, each of a whole haliotus shell. They are presumed to be graphic representations of the tribe's hero, some warrior leader whose bones have lain long in the earth from whence he sprung. Characters in curved and rigid lines run along panels pendent from the roof, and between them drape soft "raupo" matings of many patterns above the hard rammed earthen floor. From the face of the ridge-pole an absurdly ugly "god" keeps a wary look out for the approach of evil spirits. Around the interior, in artistic disorder, lay the treasures of Maori lore and customs collected or presented to Lord Onslow during his period of office as the Queen's representative in New Zealand.

It is an interesting fact that in Saigon, a city in the French portion of Cochin China, there is a Cathedral with twin spires, formed entirely of metal, the octagonal framework consisting of double angle-bar ribs tied together by six intermediate horizontal octagons of H-bar with radial connections from the centre to the ribs, and stiffened by angle-bar diagonals between these horizontal members. The upper ends of the eight ribs are connected into an eight-rayed casting, and above this are fastened to a large cross of cast-iron and wrought-iron angles with which each spire terminates. In four of the eight sides gabled openings are formed, the gables being supported on cast-iron columns, resting on the base of the spire. The base is secured to the masonry of the towers by means of brackets, 7ft. 4½in. deep, on the inside of the walls, and tied together by a framework of H-bars, which also carries a cast-iron chequered floor. The height of the spires is 78ft. 9in. from the top of the masonry to the base of the cross, which is 10ft. 2in. high. The weight of the ironwork in each spire is 28½ tons, and that of the zinc covering about 2½ tons.

At a recent meeting of the London County Council, on the paragraph in the report of the Establishment Committee dealing with charges for central office expenses and for the Works Department, Lord Onslow moved that it be an instruction to the committee that, before the consideration of the Special Report, the estimates of the actual cost of works executed before March 31st last should be presented. Mr. Shaw-Lefevre moved that it be referred to the Finance Committee to consider and report as to the expediency of inserting a clause in the Money Bill of the Council for the coming year, authorising the Council to use the money of the sinking fund for the purchase of well-secured freehold ground-rents within the metropolitan area. He pointed out how rapidly the value of freehold ground-rents was increasing, and that the Council had power to retain ground-rents in the case of street improvements. If they purchased ground-

rents when opportunity arose they would largely increase the income of the Council, and would gain more than £6000 a year over the amount paid by local authorities for money borrowed. In fifty or sixty years the property would be worth five or six millions. Mr. Costello seconded the motion. The motion was adopted unanimously.

THE collection of miniatures formed during many years by Dr. Lumsden Propert, who is regarded as the first authority on the subject in England, has been purchased by the Fine Art Society, and will very shortly be exhibited at its Bond Street Galleries. The collection has been formed with the dual object of comprising not only a complete historical survey of the school of miniaturists from Holbein downwards, but of the celebrities whom they painted. Thus, from Holbein's celebrated portrait of Jane Seymour onwards, there is everyone of the Tudor and Stuart royalties, as well as portraits of Cromwell, Milton, Drake, Raleigh, Evelyn, Nell Gwyn, and the beauties of the Stuart and Georgian Courts. There are also three of Shakspeare, two being known and engraved as the Somerville and Auriol portraits. Of specimens of the celebrated and rare early miniaturists there are no fewer than nine Hilliards, eleven Olivers, and fifteen Coopers, with undoubted pedigrees. Nor is the collection confined to the seventeenth and eighteenth century English masters, for it is rich in enamels by the Petitots and the foreign schools of miniaturists.

At a recent meeting of the City Commission of Sewers, Mr. H. G. Smallman presiding, the committee brought up a report upon applications from the Post Office authorities for permission to take up carriage and footways in the City for laying telegraph-wire pipes. In reply to inquiries by the Commission, the Post Office stated that certain pipes would be now for both telegraphic and telephonic purposes. The Commission had refused to allow the National Telephone Company to open the streets to lay down telephone tubes unless they made certain concessions to the public in the matter of their charges, which they had declined. The company had surmounted the difficulty by approaching the Post Office, who charged them a rent for the use of the Post Office circuits. The committee recommended that application should be made to the Treasury to institute an inquiry into the action of the Post Office authorities in constructing underground circuits and allowing them to be used by the company for telephone purposes without the consent of the Commission as the statutory authority. This was carried, Captain Hall, the chairman of the committee, observing that the Post Office was seriously hampering the public authorities in their efforts to obtain telephonic concessions from the company.

THE tessellated pavement which was discovered a short time ago, when excavating for the bases of the pillars of the Roman Portico in Bailgate, Lincoln, has been taken up in one piece without breakage, and is to be placed in the museum at the school of Science and Art. The pavement is most elaborately designed, and is believed to be one of the most beautiful specimens of Roman pavement ever discovered.

PROBABLY owing to the all-powerful influence of the Jubilee celebrations, the summer Art season will commence a little earlier than usual. To the New Gallery will fall the honour of opening the ball. As far as can be foreseen, this is likely to be a rather lean year in matters of Art. Few leading Artists are sending any pictures of special importance either to Piccadilly or to Regent Street, while several are very poorly represented, and a few do not exhibit at all. If, however, the year's work leaves something to be desired in regard to quality, there is no falling off in the quantity of the output. Some twelve or thirteen thousand pictures were sent in to the Academy, and these are supplementary to the large number of works shown at the galleries of the Institute of Painters, the Royal Water-Colour Society, and the Society

of British Artists. The marvel is what becomes of all these pictures. Presumably there is a market for them or they would not be produced in such quantities year after year.

THERE has recently been designed a pair of memorial tablets for Stevenson's grave on the summit of Yae Vaea Mountain, and these are now on their way to Samoa. The tomb of Tusitala in every way resembles that of a Samoan chief. It consists of a simple block of concrete resting upon a platform of the same material. On each side of this curious sarcophagus will be fastened the two tablets. On the one is inscribed the "requiem" written by himself many years ago, and simply setting forth the years of his birth and death, the Greek Alpha and Omega, "the Beginning and the End." On the other tablet will run, in Samoan, "The High Chief Grave of Tusitala," with the Scottish thistle and the hibiscus of the South Seas.

UNTIL recently there stood at the south-west corner of Dean's Yard, Westminster, one of the most magnificent planes in London, tall, straight, and stately, and well over a hundred years in age. Unfortunately, the recent clearances and widening of the roadway in Great Smith Street have necessitated its removal. There is just room on the site cleared for the erection of two good houses facing into Dean's Yard, one of which is to be occupied by Dr. Troutbeck, the coroner for Westminster. Every foot of space was needed, and so this noble tree was first lopped of its branches and then hewn to the ground. Its destruction was no doubt inevitable, but Westminster Abbey and its immediate surroundings are the poorer for the loss.

THE Fine Art Society in Bond Street was, if we mistake not, the first to inaugurate the "one-man shows" which have proved to be so popular. The latest turn in the art-kaleidoscope introduces us to the works of Mr. Graham Petrie and Mr. Charles Hazlewood Shannon. The first named Artist gives us a collection of close upon eighty landscapes of infinite variety, painted in England and abroad. Wherever Mr. Petrie may be he has a rare eye for the picturesque and a fine feeling for colour. This is equally evident in a homely scene such as "Buttercups: Netton, near Salisbury," or in the translation of the Architectural beauty of "S. Giorgio Maggiore, Venice." Though Mr. Shannon's present collection is less important than last year's, it is one of very great interest, and shows the enormous amount of trouble the Artist takes over the most minute detail. In this collection there are no fewer than sixty specimens, which comprise lithographs, studies in sanguine and black and white, essays in silver point, and pictures in pencil. Students will especially find this collection valuable, being full of suggestion and abounding in knowledge and power; the Artist's fine feeling for grace of line and beauty of form is evident in well-nigh every drawing here exhibited.

At the last meeting of the Society of Antiquaries, held at Burlington House, Mr. W. H. St. John Hope, the assistant secretary, read an exhaustive report on the results of the excavations made at Silchester. During the course of last year's work a hitherto unknown gateway was revealed in the western wall, to the south of the main entrance to the city on this side. Sections of the ditch outside the wall disclosed the fact that there had been a mound in the centre of the ditch, the object of which was no doubt to serve as a foundation for the trestle for supporting the drawbridge. A similar mound was found some years ago in front of the Aldersgate entrance to the Roman City of London. Insula xvi. is situated to the east of Insula xv., and is separated from the central Insula (No. iv.), containing the forum, by Insula iii., explored in 1891. It will be remembered that in 1895 the first example of a Romano-British pump was dug up at Silchester. Further light has now been thrown on the hydraulic engineering of the period by the discovery of a line of wooden water pipes, with peculiar joints made with

iron rings, similar to those used in Gaul, and of a well, lined with wood and flint rubble, in an unusually good state of preservation. The well was sunk to a depth of about 18ft., partly through vegetable mould and partly through gravel, until an impervious bed of clay was reached. At the bottom of the well was a rectangular frame, constructed of four oak timbers jointed at the corners like an Oxford picture frame. Above this was a tub 5ft. high and about 3ft. 6in. in diameter, wider at the top than at the bottom, and made of twenty-six fir staves. The remaining portion of the interior of the well above the tub was lined with a wall of flint rubble.

A correspondent writes that a pressing need in Birmingham is the absence of residential chambers or flats, such as are to be rented in other cities. If flats were erected in a pleasant central position, such as the Five Ways, with modern improvements and conveniences, they would be a boon to many, and no doubt would be eagerly sought after.

THE Government has at last decided to accept Lady Wallace's bequest, and to purchase Hertford House, where the great collection of Art treasures is now placed. The Chancellor of the Exchequer hesitated at the cost of finding a building for holding and exhibiting the treasures, which was one of the conditions of Lady Wallace's will. The price of the house, including the freehold of the site, will probably not be under £150,000.

THE Vestry of Hampstead has for some time had under consideration the question of providing a suitable coat-of-arms, crest, and motto for the borough, and at its next meeting the vestry will be asked to adopt a design of which the following are the details:—Coat-of-arms—Azure on a cross argent a mitre between four fleurs-de-lis 'gules, a chief indented or, fretty 'gules. Crest—A buck's head couped argent, gorged with a wreath of holly fruited proper. Motto—Tout bien ou rien. These insignia have been arrived at on the historical method by combining and adapting certain coats-of-arms of families that have played an important part in the history of Hampstead. The "parent" arms are those of the Abbey of Westminster, to which the Manor of Hampstead was granted in 986, and those of the families of Hickes, Noel, and Langhorne. The wreath of holly is intended to commemorate the present seal of the vestry.

DR. BLISS's latest report on the excavations in Jerusalem says:—"With the exception of a few remains, all our discoveries, achieved by arduous work of tunnelling, have been covered up again. Walls and towers, streets and mosaics, unseen and forgotten for centuries, have during the last three years been once more looked upon by a few observers, and again have been buried under the soil. Since the double wall on the western hill was excavated, a crop of barley has been sown and reaped in the ground which again covers it. I never fail to feel a sort of melancholy when I give the orders to repack the tunnels and to fill the shafts level with the surrounding fields. The one satisfaction is that it is safer to leave these ancient remains under the protecting covers of debris than to irresponsible landowners, who would see in these monumental stones only material for building walls and houses. It is a comfort to feel that the Crusading Tower, found in the land of the Augustinians, has been left open, and is being carefully protected by the proprietors."

THE Earl of Radnor has given a site in Radnor Park, Folkestone, for a new Congregational Church. At the laying of the memorial-stones the contributions to the building fund amounted to about £850.

THE mosaic decoration of the interior of St. Paul's Cathedral, from the designs of Mr. W. B. Richmond, is going on apace, and Messrs. Powell's workmen are putting forth special efforts to expedite the work.

## PLYMOUTH CORPORATION WORKS.

## A SANITARY SCHEME.

THE Borough Surveyor of Plymouth has prepared a very lengthy report, in which he detailed a scheme for Corporation sanitary work. In it he said during the past three years a large amount of work had been executed by the Corporation without the intervention of a contractor, which had given him an opportunity of forming an opinion as to the character of the work the Corporation should take in hand, and he had come to the conclusion that it should be, all road-making, street-widening, sewerage, and recurring work. The erection of all new Corporate buildings should be let by contract. In the carrying out of new works by the Corporation, it was undesirable to employ any of the ordinary staff engaged for the maintenance of existing sewers and buildings; a separate staff should be employed. He pointed out that the Committee was already committed to many important works in main drainage, reconstruction of subsidiary sewers, widening of Old Town Street and Tavistock Road, widening of Embankment Road, repairing of sundry streets, making and sewerage of new street from Cattedown Road to Breakwater Hill, sewerage of Pennycross and Laira Green, in addition to which there were a great number of new streets and lanes laid out, and in process of being laid out, which would require to be made and completed at an early date. The existing depôts at Mill Street, Sutton Road, and Coxside were inconvenient and inadequate, and he would suggest the desirability of combining the first two into one, and placing it on corporate land at Prince Rock. In order to carry out any portion of the works before-mentioned by Corporation workmen, it would be necessary to appoint as a minimum staff a superintendent of works, a book-keeper, a cost clerk, timekeepers and clerks of the works according to the number of jobs on hand and the extent of the work. In connection with the

## CARRYING OUT OF CORPORATION WORKS

great inconvenience, delay, and extra expense had been incurred consequent upon the unsatisfactory way in which the cartage contract had been carried out, and he would suggest that the Corporation provide its own horses, carts, &c., for the general cartage, as well as the street watering and cleansing. The report also dealt with the collection of house refuse, and its disposal. It was generally admitted that the work of collecting and disposing of the house refuse of the borough had not been satisfactory, having been carried out in a most perfunctory manner, frequently causing much inconvenience and danger to health. This had arisen, in his opinion, from improper and insufficient plant, and a low contract price for carrying out the work. The present method of disposal was open to much objection upon sanitary grounds, and it was desirable that some approved method of disposal should be adopted at the earliest possible moment. He presumed that a destructor would be necessary to dispose of the refuse, and considered in all 77 horses would be required, 12 for street watering, 15 for sweepings and brooms, 15 for general cartage, and 35 for refuse removal. He submitted an estimate of the capital expenditure, which included the provision of stabling for 95 horses, sheds for 180 carts, forming yard surfaces, &c., drainage, stable plant, destructor, land for depôt, fittings and appliances for depôt, making in all £29,481. Then the plant for house refuse removal would cost £3908 10s. more, for street watering £679 10s., for removal of street sweepings and horse broom £1635, and for general haulage £1533, making an aggregate of £37,237. The estimated annual charge was £10,605 18s. 6d., of which £814 18s. 9d. was for stabling, £1071 15s. 8d. for destructor (less £500 saleable manure), land repayment £233 4s., depôt £411 5s., plant for refuse removal £4438 8s. 10d., street watering £1087 10s. 9d., street sweepings, &c. £1532 6s., and plant for general cartage £1516 9s. 6d. The present annual expenditure was £6483 7s. 2d., but the Surveyor pointed out that the

new estimate covered the whole of the extended borough. In the capital estimate £6000 was allowed for land, but it was pointed out the Corporation already possessed land in every way suitable. In the estimated annual expenditure £1308 represented repayments, which, after a given number of years, would be completed, and would consequently lessen the total by that amount.

## A LONDON WIDENING SCHEME.

TO pull down no fewer than a hundred houses, to excavate about a quarter of a million yards of stiff London clay, to construct bridges or covered ways under fourteen streets and two railways, to erect a remaining wall 1½ miles in length and 25ft. in average height, and to rebuild three passenger stations, is what the Midland Railway Company is now doing, to widen its line at the London end. Parliamentary powers for the widening were obtained in 1894, but the arrangements connected with the evacuation and demolition of so many houses naturally took time, and it was not until March last year that the contractors, Messrs. John Aird and Sons, could take the work fairly in hand. The progress since made has been strikingly rapid considering the nature of the undertaking. The section of the line which is being widened runs throughout the whole distance in a deep cutting, and this, having been made after the neighbourhood had become thickly populated, is flanked, not as cuttings ordinarily are by slopes, but by high retaining walls, supporting land which, until the present work was begun, was covered with houses right up to the railway on both sides. The line is crossed, moreover, as already mentioned, by no fewer than fourteen streets, the chief of which are Kentish Town Road and Camden Road, while south of the latter thoroughfare its type of construction is that known as "cut and cover"—that is to say, a tunnel was built in an open trench, and the surface then restored over it. In widening it now there has been no alternative but to follow the same very expensive methods. Where open cutting between retaining walls had to be made before, the same method of construction has had to be adopted again. Where streets or other railways had to be under-bridged before, they have again to be under-bridged, and in this case what difference there is in the two operations is not on the side of economy. Kentish Town Road and Camden Road carried no tramways when the Midland line was first made beneath them. The engineers could do their work of bridging then with much less compunction than they are now obliged to show as to interference with the street traffic overhead. In streets the work now in hand is practically a repetition (including, it must be added, the reconstruction of the Camden Road and Kentish Town stations) of a very important section of the original work of carrying the Midland into the Metropolis. The latter, it is true, was the bigger work, inasmuch as it involved the laying of four tracks instead of two. But the present work probably is the more difficult as an engineering feat, not only because of the heavier street traffic already referred to, but because it has to be carried out immediately alongside an existing main line of railway, with the crowded traffic of which it must not for one minute interfere. The first thing done was to construct the new bridge beneath the Kentish Town Road. This was felt to be the key to the position. The Kentish Town Road once got under, rails could be laid from a junction with the existing line north of that place to the scene of the main excavation, and the "spoil" removed by truck-loads instead of by the much more costly and less efficient process of carting. In the main thoroughfare no fewer than thirteen houses had to be demolished, and Leighton Road, too, which joins Kentish Town Road just where the railway passes under, has had temporarily to lose several buildings. It added to the difficulties of the work at Kentish Town—and this, indeed, is the case with every one of the new bridges required for the widening—that the railway crossing is very much "on the skew," i.e., it runs under the road slantways.

All obstacles, however, have been successfully surmounted; the new bridge has been in its place since December last, and the temporarily demolished public-house at the street junction is now being restored as rapidly as possible.

## KEYSTONES.

AT Mundesley-on-Sea it has been decided to erect a new chapel to seat 250 persons, at a cost of £850.

A NEW public school for Denny, erected at a cost of £7000, to accommodate 526 scholars, was opened the other day.

AT a recent meeting of the City Commission of Sewers several applications to erect stands in or near St. Paul's Churchyard were unanimously refused.

IN connection with the Wesleyan Reform denomination, a new chapel has been opened in Doncaster Road, Barnsley, which has been erected at a cost of £2000.

IT has been decided to enlarge the melting-house at the Mint on Tower Hill. This step will involve an expenditure of £1100, which has been sanctioned by the Treasury.

MR. ALFRED SHUTTLEWORTH has given a site, valued at over £1100, for a new mission church at Lincoln, and £500 towards a mission hall to be used until a permanent church can be built.

A NEW Roman Catholic school is being built at Penzance, in the parish of St. John, as a substitute for part of the Old National Schools, and the Wesleyan School has been improved at considerable cost.

MIDDLESBROUGH Town Council has decided to expend £3000 on improving its streets, £2500 on new baths, £3000 on an organ for the Town Hall, and £2000 on beautifying Victoria Square, in Commemoration of the Diamond Jubilee.

THE Birkenhead Town Council has resolved to expend £20,000 in extending the electric lighting of the town. It is stated that an expert opinion has been obtained to the effect that there is no danger in using water gas combined with 50 per cent. of coal gas.

A LARGE club house is now being completed for the accommodation of the Edinburgh Burgess Golfing Society at Barnton, about three miles west of the city. The building, it is said, will be the finest of the kind in Scotland, the cost being about £6000.

THE artist and engraver, Monsieur Pierre Gusman, who lately was the holder of the travelling prize under the Ministère des Beaux-Arts, is to give an exhibition of his exquisite Pompeian water-colours at the Ecole Nationale des Beaux-Arts, in Paris, from the 15th to the 26th May.

SUBURBAN theatres are now springing up in all directions round London. One of the best structures of the kind is that in course of erection in the centre of the thoroughfare of the Broadway, S.E., between Deptford and New Cross Stations of the London, Brighton, and South Coast Railway. The theatre will accommodate an audience of over 3500 persons. The entire building will be lighted by electricity.

A SYNDICATE has been formed in Denver to build a 1000 mile bicycle tourist circuit in the mountains, starting from Denver and extending to Estes Park, seventy-five miles distant. From there it is proposed to circle west and south to Manitou, via the Ute Pass, and returning to Denver by way of Manitou Park and South Platte. The plan includes the building of cabins about twenty miles apart, and hotels about seventy-five miles apart.

THE Select Committee of the House of Commons has given its decision in the City and West End Railway Bill, and of the Brompton and Piccadilly Circus Railway Bill. The Committee has heard a great many witnesses for and against the Bills, and has now decided that the preamble of the Brompton and Piccadilly Bill is proved, and it rejects the City and West End Bill. It has also heard evidence with respect to the deep level scheme of the Metropolitan District Railway Company between Earl's Court and the Mansion House but the further consideration of this Bill was adjourned.

## A NEW BRIDGE ACROSS NIAGARA.

DURING the past fortnight there has been brought to a climax one of the greatest engineering feats in the way of bridge-building the United States has seen for some little time. This was the joining of the two sections of the great new steel arch bridge which during the past few months has been in course of erection across the Niagara gorge. This enormous all-metal arch is being built to take the place of the old railway suspension bridge over which the trains of the Grand Trunk Railway have for years crossed the Niagara chasm. It is worthy of note that, despite the difficulty of the work and the dangerous nature of the locality, the work of erecting the bridge has progressed steadily without loss of life, and, furthermore, no serious accident has happened on the work. The abutments of the arch are placed about half-way up the slope between the top of the cliff and the water's edge. They are four in number, two on each side of the river. They are built of huge blocks of stone obtained from the best of quarries. It is on these abutments that the bed plates of the arch rest. Preparatory to the erection of the steel superstructure the space between the abutments and the cliffs was filled in with huge scaffolding or false work, on which the end spans of the arch were built. From this point the panels of the arch were fitted piece by piece, gradually nearing the centre, where, high over mid-stream, the last panel was fitted on Sunday, March 28th, and on Monday, March 29th, the task of joining the two ends took place. At either side of the old suspension bridge, at both the Canadian and New York State ends, great screws were laced, and by means of these screws the sections of the arch were lowered. Between the ends of the two sections there remained a space of about 2in., which required adjusting. The levers of the screws had been manned by gangs of men, and at a given signal they began to turn the levers, which allowed the two sections gradually to come together. This work naturally required the greatest skill, and Chief Engineer L. L. Buck was personally in charge. First one corner, then another was lowered, until finally all the screws were operated together and the sections met so accurately that the bolt holes matched perfectly. As evidence of the engineering skill of the present day it was a great triumph. It is expected that the arch will be completed in June. It will have a span of 550ft., connected at either end with the cliff by a trussed span 115ft. long. It will have an upper and a lower deck. On the upper deck will be laid the tracks for the accommodation of the steam railroads. The suspension bridge has but a single track, while the new arch will have a double track, thus greatly increasing the facilities of crossing the gorge. On the lower floor there will be room for a carriage-way, side-walks, and trolley car tracks. These trolley tracks will be the first to be stretched across the gorge, and will allow of an exchange of trolley traffic between the two sides of the river, resulting finally, probably, in a belt line about this great beauty spot between the two countries. In its complete state the new arch will have about 6,000,000lb. of steel in its make up, and it is expected to carry a load of 10,000lb. to the foot, which is a very heavy load. As it stands to-day the arch is built under and about the old suspension bridge, which will soon be removed, all it is expected, without delay to travel. This suspension bridge was first opened in 1855. When originally built the superstructure was of wood, the towers being of stone. In 1880 the suspended structure was renewed in steel, and in 1886 the stone towers were renewed in steel, all under the direction of Engineer Buck. The arch is being built by the Pennsylvania Steel Company of Steelton, Pa., for the Niagara Falls International Bridge Company and the Niagara Falls Suspension Bridge Company, one being a Canadian and the other a New York State incorporation.

THE Prince of Wales recently laid the foundation-stone of some new buildings at the English hospital at Cannes.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

## THE ELECTIONS.

(COMMUNICATED.)

THE list of members, officially nominated for election, to serve on the four standing committees for 1897-98 has just been issued. On these committees there are sixty-four positions, and for these no less than sixty existing members have (officially) renominated themselves. This appears to be distinctly unfair to others who may wish to come forward, and it is contrary to the best interests of the Institute that the same names should appear year after year, thus excluding new men and fresh ideas; the compulsory retirement each year of a certain proportion of the members would give others a chance of being useful to the Institute. Members have a tendency to vote for those candidates with the asterisks before their names, shewing them to be existing members of committees, but one-fourth only of the members appear to vote at all; the election is an expensive affair, and seems scarcely justifiable when so few new names are brought forward by the Institute authorities, as may be seen from the following:—

## LIST OF MEMBERS NOMINATED TO SERVE ON THE STANDING COMMITTEES FOR 1897-98.

The Balloting Paper for the election of the Four Standing Committees (to be announced on June 14th, 1897) will be issued a few days after the Annual General Meeting, Monday, May 3rd, 1897.

*Art Standing Committee (Fellows: Ten names only to be returned).—*\*Anderson, John Macvicar; \*Belcher, John; \*Brooks, James; \*Brydon, John McKean; \*Caroe, William Douglas, M.A., F.S.A.; \*George, Ernest; \*Mountford, Edward William; \*Pite, Beresford; \*Waterhouse, Alfred, R.A.; \*Weatherley, William Samuel; \*Young, William. (Associates: Six names only to be returned.)—Balfour, Robert Shekleton; Dawber, Edward Guy; \*Fleming, Owen; \*Gibson, James Sivewright; \*Hare, Henry Thomas; \*Romaine-Walker, William Henry; Simpson, John William.

*Literature Standing Committee (Fellows: Ten names only to be returned).—*Bibby, George Henry; Caws, Francis Edward; \*Florence, Henry Louis; \*Graham, Alexander, F.S.A.; \*Hebb, John; \*Ingelow, Benjamin; Perry, John Tavenor; Pite, William Alfred; \*Smirke, Sydney; \*Spiers, Richard Phené, F.S.A.; \*Street, Arthur Edmund, M.A. Oxon.; \*Townsend, Charles Harrison; \*Unsworth, William Frederick; \*Waterhouse, Paul, M.A. Oxon. (Associates: Six names only to be returned.)—Bolton, Arthur Thomas; \*Fletcher, Banister Flight; \*Flower, Arthur Smyth, M.A. Oxon., F.S.A.; \*Prentice, Andrew Noble; \*Smith, Ravenscroft Elsey; \*Waterhouse, Leslie, M.A. Cantab; \*Worthington, Percy Scott, M.A. Oxon.

*Practice Standing Committee (Fellows: Ten names only to be returned).—*\*Batterbury, Thomas; \*Boyes, Henry Cowell; \*Clarkson, Samuel Flint; \*Hall, Edwin Thomas; \*Harris, Thomas; \*Kersey, Alexander Henry; \*Mathews, Joseph Douglass; \*Nash, Walter Hilton; \*Ridge, Lacy William; \*Woodthorpe, Edmund, M.A. Oxon. (Associates: Six names only to be returned.)—\*Atkin-Berry, William H.; Goldsmith, Francis Thos. Wilberforce; \*Hardcastle, Frederick Henry Appleton; \*Hare, Henry Thomas; \*Julian, George Richards; Mundy, Thomas Edward; \*Tanner, Augustus William; \*Wilkinson, Robert Stark.

*Science Standing Committee (Fellows: Ten names only to be returned).—*\*Angell, Lewis, M. Inst. C.E.; \*Farrow, Frederic Richard; \*Quilter, John Salmon; \*Joseph, Delissa; \*Searles-Wood, Herbert Duncan; \*Smith, Percival Gordon; \*Solomon, Lewis; Seth-Smith, William Howard; \*Street, William Charles, Assoc. Inst. C.E.; \*Tabberer, Benjamin; Young, Keith Downes. (Associates: Six names only to be returned.)—\*Burrows, Henry William; \*Clarke, Max; Cole, Robert Langton; \*Dicksee, Bernard John; \*Garbutt,

Matthew, Assoc.-M. Inst. C.E.; \*Pearson, George.

N.B.—The asterisk (\*) denotes a member of the existing committee.

With regard to the Council nomination list matters are even worse, the president, vice-president, and members of Council and secretary number twenty-four, and of these twenty-three are renominated, not by the Institute, but by themselves!

It is to be hoped that the members, and especially those in the provinces, will not be led to vote for candidates merely because they have asterisks before their names, and that they will remember that it may be possible to deal with the very large income of the Institute to greater advantage than hitherto, if new councillors and committee men should be brought forward. Any seven members (if including four fellows) may make private nominations for elections to the above positions.

## KEYSTONES.

New electric light works have been erected on the Irrigation Farm at Harrogate. The total cost of the installation for the borough is about £25,000.

The Sheffield City Council has decided to buy the undertaking of the Sheffield Electric Light Company. The corporation some years ago acquired the water undertaking, and recently took over the city tramways.

The laying of new water pipes in High Street, Berwick, has revealed, near the Black Bull Yard, at a depth of 4ft. or so from the surface, foundations of a substantial nature. These are believed to be the foundation of the Main Guard, which stood at this place from 1741 to 1815, when it was removed to the present quarters adjoining the Quay Walls.

The workmen engaged on the reconstruction of the Broomielaw Bridge at Glasgow came upon what is undoubtedly the foundation-stone of the old Broomielaw Bridge, which was laid with full Masonic honours by the Lord Provost, the Hon. James Ewing, on Tuesday, September 3rd, 1833. The stone, which is of fine granite, is as clean as though it were fresh from the hands of the cutter.

The clock in the tower of St. Mary's Church, Great Dunmow, has fallen down and been smashed to atoms in the churchyard below. For some time the condition of the tower generally has been considered unsafe, and notices have now been posted warning the public of the fact. The tower is regarded as one of the oldest in Essex, and is a stately building. An effort is being made to thoroughly restore it.

The necessity of further under-building the walls of the Albert Institute is engaging the attention of the Works Committee of the Dundee Town Council. The City Architect has stated that £650 would complete the work. The Committee is of opinion that only one wall should meantime be treated, at an estimated cost of £300, and it has instructed the Architect to procure and bring up tenders for the work.

An interesting discovery has just been made at Mr. Labouchere's residence, "Pope's Villa," Twickenham. The house, it is known, stands on or near the site of the house where lived Alexander Pope, but the exact location has not been known until the discovery by some workmen of an old stone, hidden by some masonry. This stone bears the inscription, "On this spot stood until 1809 the house of Alexander Pope. The grotto that formed its basement still remains."

The Whitefriars' Monastery gateway, included within the precincts of the Coventry Workhouse, has now been so far improved that the earth, which hitherto has almost filled it up, has been removed. The original floor is about 4ft. below the yard level, and stone seats on either side the entrance are brought to view. It is now proposed that the ground should be cut away in front of the archway, and so bring the entire structure out to the better view of visitors, who in summer time are very numerous.

### LONDON: ITS GROWTH AND HISTORY.

IT seems difficult to imagine that there ever was a time when London was a small place, yet when the Queen was born it was very little larger than Glasgow is now, and only double the size of Birmingham. To properly appreciate the leaps and bounds by which the metropolis has grown during the present century, a rapid glance should be taken at its past history. It is usual to praise "the good old times;" but, until a comparatively recent period, London made surprisingly little progress. Originally a stronghold in the woods, strengthened by ditch and rampart, it became an aggregation of rude, hive-shaped huts of bark, clustered around the ford, which preceded the first London Bridge, where the people, clad in skins, lived in primeval simplicity. Under the Romans for four centuries, it became a walled city, and made some progress towards civilisation; only to disappear from history for six centuries under the Saxons, who despised the palaces of the Romans, preferring to live in the open, and to fight under cover of the woods than from behind walls. For a large part of this time it lay desolate and uninhabited, the only signs of life being at the village of Charing, within bowshot of its ruins, with Kensington and Fulham on the west, Hampstead and Islington on the north. Though largely rebuilt under Alfred, London did not become a city of any importance until the rule of the Normans, when magnificent buildings, including the White Tower, Old St. Paul's, and Westminster Hall were erected. At this time, as shown by the Domesday Book, London was almost entirely

#### CONFINED WITHIN ITS OWN WALLS.

Westminster had no existence as a town; the principal suburban houses, if any, were on the eastern parts of the City, between the wall and the River Lea, towards the Thames Marshes on the south, and on the rising ground Hornsey way. Stepney was the most populous place in the neighbourhood. Neither King nor Parliament had any fixed local habitation until long afterwards, when London became the metropolis of the country and the commercial emporium of the world. Yet for five centuries more, London grew but slowly. It is usual to compare the glories of the present reign with those of Elizabeth, but between the London of to-day and that of "Good Queen Bess" there is really no comparison. London was still girt around by the walls built by the Romans, and was largely enclosed within them. The mansions of the great lay outside the City walls, chiefly on the way from the Strand to Westminster. There were few stone houses, and none tiled or slated, being mostly built of wood and thatched with straw. Beyond the Royal Palace at Westminster was open country, and marsh lands formed the sole feature of the landscape across the river. On the other side of the City was open country, with "Merrie Islington" a village in the distance. Where St. Sepulchre's Church now stands were slums. In Golden Lane was a row of curious old houses which had been used as a nursery for the children of Henry VIII. Round about the Moor Gate were large houses, and further out a watery tract which abounded with wildfowl. The citizens used to exercise themselves here with archery practice and sport. In Bishopsgate the Earls of Devonshire had their palace. Houndsditch was a foul ditch, the receptacle for sewage; and there was a similar ditch on the western side of the City.

#### SANITARY SCIENCE WAS UNKNOWN.

The paving of the streets was in its infancy, except with regard to a few of the principal thoroughfares; each inhabitant paved as much as he liked before his own door with the materials that his pride, poverty, or caprice might suggest. The streets were obstructed with stalls, sheds, sign-posts, and projections of every kind; kerbstones were unknown, and only in a few thoroughfares were the footpaths divided from the carriage way with posts and chains. This was the London of Elizabeth, just three hundred years ago—a very different City from that of to-day—a London gradually

becoming foul and pestilential, ultimately to be cleared and purified by the Great Plague, which carried off a fifth of the inhabitants in 1665, and the Great Fire of the following year which involved 400 streets, 13,200 houses, 88 Churches, St. Paul's Cathedral, and four City gates. Before the fire it is estimated to have contained from 10,000 to 12,000 streets, alleys, and lanes, 156,000 houses, and about 700,000 inhabitants. So that in seventeen centuries London had grown to a population of under three-quarters of a million. Rather than to Elizabeth, London owes its growth to Charles II., for after the Restoration those who returned with him did not care to return to their old City houses, but built themselves mansions further west, leaving the City to the merchants, by whom it has ever since been monopolised. To James I. we owe Pall Mall; and Kensington was originated by the creation of a Palace there when Whitehall was burned down. It is a curious feature in the growth of London that it has always been considered to be

#### OVERBUILT.

As far back as 1580 it was forbidden to erect new buildings "where none had existed before in the memory of man"—the reasons given being that "it was calculated to encourage the existence of the plague; create a trouble in governing such multitudes; bring about a dearth of victuals; multiplying of beggars, and an inability to relieve them; an increase of artisans more than could live together; impoverishing other cities for lack of inhabitants." The decree also stated that "lack of air, lack of room to walk and shoot, &c., arose out of too crowded a city." But it was impossible to stem the increasing tide of population. The only result was to cause overcrowding, which proved a still greater evil than over-population, and led up to the horrors of the plague year. Even at the beginning of this century, when London consisted of 160,000 buildings, standing in 8000 streets, it was declared that London was overgrown and too big; and there was an outcry because the parishes had to pay £10,000 per annum to scavengers for removing ashes and refuse from the houses, whereas in former years the scavengers used to pay the parishes £25,000 for the privilege of taking away the ashes for brick-making purposes. Those were evidently the days of the "Golden Dustman." Yet building went on, until in 1873 there were 66,132 miles of streets and 528,794 inhabited houses. During the Queen's lifetime cobbled roadways have almost disappeared; cabs and omnibuses have come into vogue; railways have supplanted the stage coach; the toll-gates which met Londoners at every turn have been pulled down; the Fleet Prison has gone, with others which had rivalled its evil reputation; Temple Bar has been removed; and endless changes effected. The old narrow streets, with their flat-fronted houses, have been largely replaced by wide thoroughfares and handsome stone buildings. A few facts bring home to us the rapid growth of London. In 1760 the land beyond Montagu House was occupied as a farm. All beyond Portland Chapel was open country; St. Pancras Church was still "a mile from London." Camden Town was begun in 1791, and afterwards Paddington also. As recently as the reign of George II. there was a spring of crystal water in what is now Hanover Square, and snipe and woodcock were there shot by sportsmen. During the lifetime of the Queen there were marshy fields, the haunt of the wild goose, plover, and mallard, where now are Belgrave and Eaton Squares. Many other instances might be given of the rapid growth of London, facts which make one wonder whether there will be any finality.

THE Bootle Free Library and Museum Committee has prepared a scheme for the erection and equipment of a technical school at an estimated cost of £16,800.

At Lockerbie, the new school buildings erected in connection with Dryfesdale Schools were formally opened a few days ago. The buildings were erected at a cost of £4300, from designs by Mr. F. J. C. Carruthers, Architect, Dumfries.

### THE LAST OF ADDINGTON PARK.

IT is understood that the Ecclesiastical Commissioners have determined to dispose of the house and land at Addington Park, Surrey, which has been occupied for many years as the country and summer residence of the Archbishop of Canterbury, and this decision is for several reasons to be commended. The mansion itself is large and cumbersome, and the Episcopal estate proper consists of a demesne of nearly 500 acres, while, in addition, an adjoining property of 700 acres is leased to the Archbishop by the Commissioners. The maintenance of such an extensive establishment is, of course, a great drain upon the present reduced revenues of the See, nor is the expenditure to be justified on grounds either of sentiment or utility. In 1780 the Palace at Croydon had been for some time vacant. It had been occupied continuously as a residence from the days of Archbishop Peckham to the time of Archbishop Cornwallis, and it is not quite easy to understand why it had fallen into disuse. In its way it was stately enough, and full of historical interest, and although Archbishop Grindal declared it to be "no wholesome house," he yet petitioned to keep it when urged to resign the Archbishopric, and it is related of Whitgift that "he had ever a great affection to lie at his mansion-house at Croydon for the sweetness of the place, especially at summer time." However, for some reason or other, it grew into disfavour, and with its meadows and gardens, covering some fourteen acres, was accordingly disposed of for £2520, and a new palace was ordered to be built at Park Hill, within half a mile of Croydon, where the Archbishop had purchased the leasehold interest in a farm belonging to the See. But this was never done, nor indeed anything else in the matter for twenty years afterwards, though a good deal of money was available for the purpose. In addition to the amount received for Croydon Palace there was a sum in Consolidated 3 per Cents bought with money received for dilapidations, and amounting, with accumulated dividends, to £2360, and also £5402 Old South Sea Annuities, which had been bought with money allowed by the Commissioners for building Westminster Bridge as compensation for the horseferry from Lambeth to Millbank, and of which the dividends were received by the Archbishops for their own use, and with the funds thus provided Addington was bought in 1808. The manor is an ancient one. The house is large, solid, and unpretentious. Its internal arrangements are devoid of any striking feature. The entrance hall contains a few portraits—Queen Elizabeth, Queen Mary, Charles I., William III., Sir Walter Raleigh, and the Young Pretender. In an inner room hangs Archbishop Warham, dated 1527, a copy of the famous Holbein which forms the gem of the Lambeth collection, and of which another copy is in the Louvre. There is a touch of characteristic sly humour still remaining in the house, which it is to be hoped no future tenant will remove. The entrance to the study is through double doors, and on the outer of these a card is affixed, duly sealed, and bearing in Archbishop Benson's handwriting the inscription:—"To close one of these doors is an act of obligation; to close both is an act of merit." The chapel added by Archbishop Howley—his predecessor dispensed with one for twenty years—was said by Bishop Wilberforce to look like a county court. It is still very plain, but it was rearranged by Archbishop Longley, and the late Primate presented some ornaments and hangings, for the disposal of which, with remarkable provision, he made arrangements in his will in the event of the building being turned to any other use. The walls are adorned with some well-designed pictures in stencil—Christ before Pilate, the Wedding at Cana, Lazarus at the Gate of Dives, and others. The old Church of Addington is well worthy of a pilgrimage. It has been simply and suitably restored—practically rebuilt—by Archbishop Howley. In and around sleep the remains of five successive Archbishops of Canterbury, whose tombs and memorials may be seen in an excellent state of preservation.

## CHELSEA HOSPITAL.

THE recent erection, on grounds belonging to Chelsea Hospital, of a score or two of lofty red-brick houses, dwarfing Wren's beautiful building and disfiguring the river bank, should draw attention to the danger which threatens a most charming fragment of old London, writes a correspondent in the Times. In Ministerial circles there is a restlessness on the subject of Chelsea Hospital which bodes no good. Within the last thirty years no fewer than three departmental inquiries have been held on the subject. Chelsea Hospital is of about the same age as the standing army of the country. It would be out of place to dwell upon Wren's work. Constructed of the simplest materials—brown and red bricks and grey slates—the hospital has that freedom and nobility of line, combined with delicacy of finish, so rarely to be met with in buildings of the present day. Facing towards the river, it stands on a succession of broad, low terraces, while on all sides wide walks and spacious lawns were designed by the Architect to harmonise with the central structure, and to carry on the prevailing idea of size and repose. The building itself remains substantially as it issued from Wren's hands, but in its surroundings changes have taken place. Originally canals, after the fashion so dear to the French school of gardening, ran below the terraces of the hospital and on either side of the broad walk to the river, to which access was given by

## A HANDSOME FLIGHT OF STAIRS.

The canals have disappeared, and an unmeaning row of bushes has been planted at the foot of the terraces, while the Chelsea Embankment has—very unnecessarily, one would think—abolished Wren's stairs. Landward, the hospital looked upon a noble garden, almost as spacious as that on the river side, and this in turn was approached from the King's Road by a long double avenue. Garden and avenue still remain, but the garden has been severed from the building, to which it gave dignity and importance, by a modern road which passes almost under the windows of the hospital. Thus detached, the garden has been laid out as a cricket ground, and now goes by the name of Burton's Court. On each side of the avenue small houses, in no way in keeping with such an approach, have been built, and the treatment of Burton's Court, as well as the interpolation of the new road, has obscured the meaning of the original plan. There have been some filchings, also, for building purposes, notably an acre and a half leased for industrial dwellings about twenty years ago. Nevertheless, until the recent erection of the new houses on the river frontage, no very serious injury had been done. The simple but beautiful lines of the hospital could still be seen from all sides; and its rich, sober colouring, in contrast only with the grass and trees of its grounds, was still saved from the intrusion of any jarring element. This can no longer be said. From Battersea Suspension Bridge the new houses obstruct the view of the hospital; and from the Battersea bank they are painfully conspicuous—inharmonious in height, in colour, and in the evidence they obtrude of painful effort to house large numbers on a small plot of land—an object so foreign to the amplitude of Wren's design.

## AN UGLY BLOT

has been made upon a beautiful picture—a picture of the greater value to London, because she possesses so few of them. It is for the public to see that this blot is not followed by others, until the picture is blurred beyond recognition. Such places as Chelsea Hospital, indeed, sorely tempt that desire to make money for money's sake which constitutes a weak side in the English character. Here is a large area of land, used merely as the garden of an old-fashioned mansion, and as an open space upon which a few old soldiers may breathe the fresh air, sun themselves in summer, and see something of their neighbours. It is true that the garden is open to the public and is incidentally of great value to the crowded districts of Chelsea. Still, it might

be sold for building by the square foot. There are persons who have a feeling that it is almost sinful to waste such an opportunity, although they may value the place in itself and may have no very distinct views as to the use to be made of the money produced by a sale. The rent of the land now occupied by new houses—£750 a year—has been applied, we are told, in giving extra comforts to the pensioners of the hospital. Every one would wish that the invalid veterans should have all possible comforts; but, seeing that Chelsea Hospital is now supported mainly by Parliamentary votes, it would surely have been better to add the paltry sum required to the amount voted by Parliament rather than to

## DISFIGURE THE HOSPITAL GROUNDS.

It is pleasant, indeed, to note that there is some growth of opinion on these subjects. The committee of 1894, in discussing the proposal to demolish the hospital, question whether "the public, the London County Council, or Parliament" would look with equanimity upon the covering of the ground with streets and houses after the sweet will of the speculative builder. The danger is, that steps to this end may be taken without the full knowledge of the public. The hospital estate is administered by a board of Trustees or Commissioners appointed by the Crown and composed mainly of military and civil representatives of the War Office; and these Commissioners have been advised that they have power to let the hospital lands on building leases. In the exercise of this power the charm of the hospital has already been marred; further leases for the purpose, for example, of enlarging the hospital, may produce yet worse effects. It should not be in the power of any Commission to injure a national possession of the great value of Chelsea Hospital, and to deprive its inmates and the public of London of a priceless open space without the authority of Parliament, given after full discussion. Whatever the interests of the Army may from time to time demand—and upon this question opinions have differed in the past and are likely to differ in the future—it is abundantly clear that in the interests of the capital and of the nation a beautiful specimen of the genius of the most characteristic English Architect should be left intact in the midst of the harmonious surroundings which alone enable the graceful simplicity of the

## DESIGN OF A MASTER-MIND

to be appreciated. When the New Forest was threatened with destruction at the hands of a Government Department, Mr. Fawcett obtained a pledge that no further action should be taken without the sanction of Parliament. A similar undertaking should be obtained in relation to Chelsea Hospital.

Mr. Delissa Joseph has written to the Times on this subject as follows:—"As a lover of old buildings and open spaces, I find myself in complete sympathy with your article. But, as the Architect of the houses and flats which form the text of the article, and upon which you vent your wrath, I feel that your note of warning would have been equally effective without the incidental attack upon the design of my work. It is an ineffective form of criticism that would compare the old and the new in Architecture. It is unjust to the new, and a slight upon the old; and the argument that the amenities of Wren's structure should not be disturbed, is not helped by taunts thrown at modern work, produced under such different conditions and for such different purposes. If my buildings dwarf Wren's structure they do not necessarily 'disfigure the river bank' any more than other groups of buildings, by more eminent hands, which line the remainder of the Embankment. All red bricks are 'glaring' until the weather has toned them; and the unconscious charm of the hospital itself is largely due to the mellowing influences of the atmosphere. Although the land I have covered is part of the estate of Chelsea Hospital, it was not part of the familiar grounds which still surround it. As a matter of fact it was a triangle of ground detached from the hospital gardens, and

formerly part of the grounds of Gordon House, at one time the residence of General Gordon. The land itself was more or less waste land, and had been the scene of the Naval Exhibition of 1891, and of the Military Exhibition preceding it. With due regard to a profitable development of the land, I have made every endeavour to preserve the

## AMENITIES OF THE NEIGHBOURHOOD,

in illustration of which I may state that, of the total area of about two acres, only about five-sixths of an acre is occupied by the houses known as Embankment Gardens and by the flats known as Chelsea Court, the remaining one and one-sixth acre being devoted to spacious roads and ample gardens; thus completely answering the suggestion in your article that the development is evidence of 'painful effort to house large numbers on a small plot of land.' The encroachment now being an established fact, it may not be out of place to consider its economic advantages to the institution. A ground-rent of £750 a year has been established in favour of the institution, with a reversion, at the end of eighty years, to buildings that have cost something under £150,000 to erect—more than the cost of the building of the hospital itself, as stated by you. This ground-rent could be sold, no doubt, at thirty years' purchase, producing a capital return of £22,500 for the two acres, which represents £11,250 an acre, and which compares favourably with the £1000 an acre paid for the land in 1683. This operation would thus produce a sum of money which could be usefully applied for the enlargement of the present hospital. As a detail of secondary interest, I may point out that the execution of my designs for the houses and flats has given employment to many hundreds of artisans in all trades over a period of more than two years. Personally, I am accustomed to these outcries as soon as the new impinges upon the old; for example, when, some years ago, I pulled down St. Paul's Schools in St. Paul's Churchyard, and built thereon huge stone warehouses, an agitation was started for throwing this priceless land into the public way in order to improve the view of St. Paul's Cathedral. However much one's pulse may be stirred by the noble monuments of the unapproachable Wren, and however much one may hunger to preserve all possible open spaces in this overcrowded City, it will be found impossible to resist the natural tendency in the development of a huge Metropolis towards the new encroachment upon and obscuring the old."

THE first completed block of buildings forming the Clarence Barracks, Portsmouth, has just been brought into use. The new barracks, when finished, will be among the finest in England.

New Sunday schools erected in connection with the Castlemere Chapel, Rochdale, have just been opened. The schools, which will accommodate 700 persons, have been erected at a cost of £3500.

An order sanctioning the expenditure of £16,000 to complete additions and alterations, to carry out a scheme of heating and ventilation, to build a new chapel, and to carry out plumbing work, &c., in Omagh District Lunatic Asylum has just been issued.

CAN a building constructed below the street level—underground in fact—be said to be erected? A contemporary puts the question for the benefit of the Sanitary Committee of the Sewers Commission, in the hope that when it next undertakes a building of that description it will give instructions for the commemorative inscription to be appropriately and correctly worded.

THE lighting of the central hall of the Scottish National Portrait Gallery, which has been defective, is to be improved by taking down a wall separating three small rooms in the front of the building from the ambulatory, and the hall will then be decorated to illustrate Scottish history by Mr. William Hole, R.S.A. The fee for the work will be 3000 guineas, and it is to be completed within three years. Mr. Hole is going abroad to study Italian decorative Art in North Italy previous to commencing the work.

## Professional Items.

**BRIGHOUSE.**—The committee appointed to consider the best method of carrying out the free public library proposal in celebration of the Queen's Diamond Jubilee, has agreed for the purchase of the Rydings mansion, house, and grounds, situated in Halifax Road, Brighouse, for the sum of £3600, the project being to utilise the mansion and house for the public library and reading-rooms and the grounds as a public park. The grounds are between three and four acres in extent, are centrally situated, and cost, with the mansion, it is said, over £10,000.

**BURY.**—The Town Council has resolved to acquire a site in Silver Street and Moss Lane for the purposes of an Art gallery and free library for Bury. Plans will be open to public competition.

**CARDIFF.**—At the Seamen's Church, Bute Crescent, Cardiff, Canon Thompson has unveiled the memorial window erected to the memory of the late Captain Pomeroy, who for a great many years was dockmaster at Cardiff. The window, which has been erected by Mr. A. Savill, of Albany Street, Regent's Park, is a large five-light one. It illustrates in the centre light the Crucifixion, with St. John and Mary Magdalen kneeling at the foot of the Cross, whilst the openings on each side of the centre represent soldiers and the multitudes. Mr. Savill introduced in the first and the fifth lights a representation of the stilling of the tempest. The whole of the subject is surrounded with a rich architectural base and canopy work in keeping with Mr. Corbett's design of the Church.

**CROYLAND.**—The corner-stone of the new chancel of Croyland Abbey was laid a few days ago. The work now in progress is carried on as nearly as possible on the lines of the old work. The new chancel is simply the removal of the recently erected east end to the next bay or to the original western arch of the north transept. By this addition the unique Norman arch of the nave will be greatly strengthened. About £1500 is needed for the preservation of the Abbey.

**DEWSBURY.**—A large shed which has been in course of erection for the last twelve months at the Ratcliffe Mills, Dewsbury, belonging to Messrs. Wormalds and Walker, Limited, is now almost completed. The building is about 200ft. square, and consists of a basement with a floor area of about 3100 sup. yards, which will be used for storage purposes, and is lighted, in addition to windows on three sides, by floorlights from the room above. Eighty-eight cast iron columns support the floor above, which is constructed with steel girders and joists from the works of Messrs. Dorman, Long, and Co., of Middlesbrough. This upper story will be used for the raising and finishing of blankets, and the floor is specially adapted to the machinery which will be placed upon it, having sinking with outlet gulley to every couple of machines. The roof of the shed is supported on ninety-six columns of special design and manufacture, as are those also below. In addition to these two large places, a couple of rooms, 40ft. x 15ft. each, are provided for tentering machines, one room, 31ft. x 30ft., for burring machines, and an engine-house, consisting of engine-room, 61ft. 6in. x 14ft., and dynamo-room, 14ft. 9in. x 14ft. The former is fitted with a new compound horizontal engine of 140 indicated horse-power and a 14ft. rope driving fly-wheel with eight channels. The walls of the engine-house are lined with best quality enamelled bricks, and the ceiling is of pitch pine. The engine-bed is of Horsforth ashlar, 10ft. deep, resting upon a concrete bed of considerable depth. The site of the building is next the river, and has furnished the sand required for all purposes and the gravel required in the concrete foundations; but, however, this nature of the stratum has necessitated the foundations being carried very low. The total cost of the

building, exclusive of ground, machinery, and lighting, is over £10,000, and the various departments of work have been carried out by the following firms: Excavating, masonry, and bricklaying, Messrs. Chas. Whitehead and Sons, Ravensthorpe; carpentry and joinery, Mr. W. H. Clegg, Dewsbury; slating, Mr. W. R. Thompson, Dewsbury; plastering, Mr. Wm. Parker, Heckmondwike; plumbing and glazing, Mr. F. Newsome; concrete and steel work, Phoenix Fireproof Flooring Company, Manchester; cast-iron work and general castings, Messrs. J. and J. Horsfield, Dewsbury. The Architects are Messrs. C. H. Marriott and Son, of Dewsbury, and the whole of the work has been carried out under their superintendence.

**DUNDALK.**—At the weekly meeting of Dundalk Town Commissioners, Mr. P. Hanratty moved that the byelaws regulating the building of houses be so altered that houses 30ft. high and under may be built with 9in. walls of good brick and mortar, instead of 14in., as is required at present. He referred to the extra cost of building the thicker walls as a reason for the renting of houses at figures difficult for working men to pay, and stated that in Belfast houses three stories high are built with 9in. brick walls, and in Liverpool as high as five stories. The motion was opposed by several members on the ground that the present bye-laws have been found to result in substantial and healthy houses being built, whereas in former times, before the bye-laws were made, the houses were put up in very poor style, and were now unsanitary and defective in many ways. It was also urged that tenants would not benefit by the change, but the builder would pocket the amount of the decreased cost. Eventually the motion was withdrawn.

**EDINBURGH.**—The Lord Provost's Committee of the Edinburgh Town Council has agreed to accept the offer of Messrs. Bruce and Sons, amounting to £32,000, for the erection of the cable-power station at Shrubhill, and the offer of Mr. Colin Macandrew, amounting to £36,800, for the station at Tollcross.

**GOVAN, N.B.**—Messrs. Thomson and Sandilands, West George Street, Glasgow, have been the successful competitors with their designs for Govan Municipal Buildings. The estimated cost of the building is £25,000.

**HAWICK WILTON.**—The halls which have just been erected in connection with Wilton Parish Church have been built from plans by Mr. J. P. Alison, Hawick, at a cost, exclusive of furnishings, of about £2500. Externally the buildings are faced with terra-cotta and red brick from Pen-y-bont, Ruabon, Wales, and are designed after the manner of the brick buildings of the early part of the sixteenth century, with mullioned and cusped windows and highly decorated chimneys.

**LIVERPOOL.**—Recently a resolution was adopted by the City Council that a project of improving Cook Street should be carried out by means of the formation of a piazza on the south side of that thoroughfare, provided it could be accomplished at an expenditure not exceeding £30,000. The owners of the property and leaseholders and others concerned have agreed to take this amount to meet compensation and the value of the land involved, they undertaking to construct the piazza, using Purbeck marble columns with granite bases. The proposition has been accepted by the Health Committee, and it is understood that the work of improvement will be commenced without delay.

**NEWCASTLE.**—At a recent meeting of the Town Improvement Committee of the Newcastle Corporation mention was made of a new kind of wood pavement which is now being used in some towns, notably in Sydney, New South Wales. It was suggested that a trial of the new pavement might be made in Newcastle, and the Committee decided to instruct Mr. Laws, the City Engineer, to have that portion of Blackett Street which lies between

Pilgrim Street and the Monument laid with the new material, as an experiment.

**SHEEPWASH.**—The decoration of the parish Church of St. Laurence has now been completed. The whole of the constructional stone work has been left in its natural state, colour having been applied to the plaster and wood only, the latter having been allowed, throughout the roof both of Church and nave, to remain as a groundwork for the decoration. The reredos is of oak, richly carved, divided into three bays, with overhanging canopies and pierced work, designed after the old local type; the finial of the central canopy terminates in a floriated cross, backed by pierced work and flanked by crocketed pinnacles; the side panels are surmounted by coves, decorated with gold stars on a blue ground, an elaborately carved cresting surmounting the whole. The whole of the work has been designed and executed by Messrs. Fouracre and Son, of Plymouth; the wood carving is by Mr. Herbert Read, of St. Sidwell's Art Works, Exeter.

**SWANSEA.**—Plans were recently prepared of new post-office buildings for Swansea, and the estimated cost of erection was £47,000. Much dissatisfaction was felt in Swansea with the character of the buildings, and pressure was brought to bear by the Town Council on the Government to grant a post-office of a more elaborate and imposing appearance. A few days ago it was announced that this effort had been successful. The revised plans give an elevation one story higher, and there will be a fleche tower above.

**YEovil.**—The Church of St. Michael and All Angels will be dedicated and opened for Divine service on or about June 14th next. The Church is a handsome structure, composed of Ham stone, in the fifteenth-century style of Architecture. There is a chancel, nave, and north and south aisles. "In the north aisle is a lady chapel. A prominent feature of the interior of the Church will be a splendid carved oak rood-screen, and in harmony with it will be the pulpit, the two altars, choir stalls, and lectern. Over the altar, in the sanctuary, angel faces are carved out in Ham stone. The tower is square and battlemented, and rises to a height of about 80ft. The drawings provided for pinnacles to the tower, but the experience of a recent gale resulted in the abandonment of them. The Architect is Mr. J. Nicholson Johnston, of Yeovil, and Mr. Pollard, of Bridgewater, has the building contract in hand. The Church is heated throughout with modern apparatus, supplied by Messrs. Petter and Sons. Messrs. Harry Hems and Sons, of Exeter, are executing the carving work and supplying the oak fittings.

At Skegness the Urban District Council has resolved to erect a tower and clock on the parade, opposite Lumley Road, at a cost of not exceeding £400.

The appearance of the choir of Westminster Abbey has greatly benefited by the fine carved oak casing which has just been added to the northern portion of the organ. The Gothic design came from the hand of Mr. J. L. Pearson, the Architect to the Abbey, and the work has been carried out by Messrs. Shillitoe, of Bury St. Edmunds.

The restoration of the exterior of Thirsk Parish Church has been commenced on the south aisle. The restoration, which is calculated to cost well up to £2000, is expected to extend over two years. The interior was restored in 1876 and 1877, and re-opened for service in October, 1878. Mr. Carnforth, who has for many years been engaged on the exterior of York Minster, is the clerk of the works.

CONSIDERABLE opposition is likely to be offered to the proposal to close Watling Street Fire Station when the new premises in John Carpenter Street (near the Thames Embankment), now rapidly approaching completion, are occupied. It will be remembered that for a lengthened period Watling Street was the headquarters of the brigade until the Southwark depot was established.

## Trade and Craft.

### A FROST-PROOF WATER PIPE.

A syndicate has recently been formed in Birmingham to develop certain patents for preventing the splitting of water service pipes under the action of frost. As is generally known, water at the moment of congelation expands with an almost irresistible force, the usual result being the fracture of the service-pipe, and the consequent flooding of the house, on the advent of the thaw. With the new pipe it is guaranteed that the occupier of a house can rest comfortably through the most Arctic winter, secure in the fact that when the thaw comes the water will flow through its proper channels. We are informed that some very severe tests of the pipe have just been made in Birmingham. With the aid of a large local ice-making plant lengths of the pipe, after being filled with water and having the ends hermetically sealed, were frozen solid throughout, then thawed, and tested for leakage under pressure, this cycle of operations being repeated on one length of pipe ten or eleven successive times without a sign of a fracture.

### ELECTRIC LIGHTING AT DERBY.

The electric light is making considerable progress at Derby. Work was started at the close of 1893, and current was then supplied for forty-five arc lamps and 7500 eight-candle power incandescent lamps. In fifteen months it was found necessary to provide engine power for seventy-seven arc lamps and 9133 private lamps. In 1895 the Town Council fixed its first 250 horse power engine for electric lighting purposes. Last year another of these engines was fixed, and at the close of 1896 the arc lamps numbered 77, and the private lamps 16,105. Another 1000 lamps have been already supplied this year, and before long the station will reach its utmost limits of production. It is now proposed to make provision for the next three years, and instead of gradually putting down a small plant, to save expenditure by obtaining a larger engine-room. It is intended to spend £10,232 in machinery, £8650 in mains and services, £450 in buildings, and £650 in accumulators, &c. Messrs. Bramwell and Harris have been engaged as consulting electrical engineers for three years.

### A NEW ENGINEERING PROJECT.

Since the completion of the Rigi line in 1872 Switzerland has given us many bold and romantic examples of applied engineering science in the shape of mountain railways, but nothing so daring and gigantic has yet been attempted as the scheme of Herr Guyer-Zeller for the construction of a line of railway up to the summit of the Jungfrau, 13,670ft. above sea level. The Scheidegg station, 2060m. above sea level, will be the starting point of the new line. From here the Jungfrau railway will run on the western slope of the Fallbodenhubel, making straight for the foot of the Eiger Glacier. Thence it will turn due east, and later on due south in a tunnel winding round the solid body of the Eiger as far as the Eiger station, which is to be laid open, like most of the other stations, in galleries similar to those found along the Axenstrasse. The tunnel will then proceed in a direct line towards the Mönch and the Jungfraujoch, which point it will reach at a depth of 105m. below the surface. It will finally curve round the uppermost pinnacle of the Jungfrau, terminating on a plateau, well known to guides, at 4100m. above sea level. From this level a lift—probably something after the pattern of the American elevators—will take the passenger to the highest point.

### JARRAHDALE JARRAH.

The "Helena Mena" has arrived in London with 125 loads of Jarrahdale Jarrah aboat, to the order of McLean Bros. and Riggs, Limited, 1, Fenchurch Avenue, London, E.C.

## SOCIETY MEETINGS.

**Sheffield Society of Architects and Surveyors.**—At the annual general meeting of this Society Mr. Charles Hadfield, the president, in the chair, Mr. C. J. Innocent (hon. secretary) read the annual report of the council, which stated that the membership has continued to increase. There are at present 34 fellows, 37 associates, 14 students, 5 honorary members, and 18 lay members, making the total number of members 108, as against 103 at the end of the previous year. The council records with regret the death of Mr. James Hall, who has been a fellow of the Society from its commencement. The ordinary meetings have been exceptionally well attended throughout the session, and very able lectures have been delivered by Mr. J. D. Leader (honorary member), on "A Study in Domesday"; by Dr. Sorby (honorary member), on "The Structure and Durability of Building Stones and Bricks"; by Mr. Beresford Pite, president of the Architectural Association, on "The Study of Architectural Design"; by Mr. John Slater, on "The Buildings of the Ancients"; and by Mr. J. B. Mitchell-Withers (associate), on "A Tour in Holland." Professor Ripper, principal of the Sheffield Technical School, has made a number of tests of bricks at the request of the council of the Society, and reported fully upon them. The R.I.B.A. made a number of elaborate experiments in brickwork, to the expense of which this Society contributed; and samples of the bricks used in those experiments were sent down, and they were carefully tested by Professor Ripper, in comparison with a number of local bricks of several makers. There has been a competition for a public building in the city in which members of this Society who are in practice were invited to compete. The subject was a fire brigade and police station in West Bar, and the Corporation appointed three assessors, viz.: Mr. C. Hadfield (president of this Society), Mr. E. M. Gibbs (ex-president), and Mr. C. J. Innocent (hon. sec. and past president), who have prepared the instructions to the competitors, and who are now engaged on an examination of the designs submitted. It must be matter for congratulation that the Society has been thus publicly recognised, and the conditions prepared by the assessors have been highly spoken of by Architectural societies in other places. The question of the election of Fellows of the R.I.B.A. has been very carefully and repeatedly considered by the council, at the request of the Institute, and some of the recommendations have been incorporated in the scheme which has been adopted. It has been decided to join the R.I.B.A. and its other allied societies in an address of congratulation to her most gracious Majesty the Queen on the attainment of the sixtieth year of her reign, which will be signed by the president and hon. secretary of the Institute, and by the presidents and hon. secretaries of the allied societies. The election of officers resulted in the following elections: President, Mr. R. W. Fowler; vice-president, Mr. Joseph Smith; treasurer, Mr. F. Fowler; honorary secretary, Mr. C. J. Innocent; council, Messrs. A. Smith Denton, H. W. Lockwood, W. F. Hemsoll, T. Winder, and W. C. Fenton.

**The Architectural Association of Ireland.**—A meeting of the above association was held on Wednesday, the 21st inst., in the Grosvenor Hotel, Mr. Howard Pentland, M.A., vice-president, in the chair. Amongst those present were Messrs. J. McGloughlin, Joseph Holloway, Geo. Sheridan, H. Alberry, and R. M. Butler (secretary). Three new members were declared duly elected. The secretary read a letter from Mr. Wm. R. Gleave, stating that owing to his being about to practise in England, he was obliged to resign the position of joint secretary, which he did with much regret. Mr. Geo. Sheridan spoke in very warm terms of the services rendered by Mr. Gleave. The Chairman said he fully indorsed all that had been said by Mr. Sheridan. Mr. Alfred J. McGloughlin then delivered a lecture on "Architectural Draftsmanship," entering fully into the various methods of draftsmanship adopted by different schools of draftsmen.

**Society of Antiquaries of Scotland.**—At the monthly meeting of the Society of Antiquaries of Scotland, held in Edinburgh, Dr. Cramond, Cullen, contributed a paper, in which he gave an account of the recent discovery of two cremation interments accompanied by cinerary urns at Foulford, near Cullen. A finely-serrated arrowhead of flint and a portion of a bone pin, over 3in. in length, were found among the burnt bones. The site of the discovery is a circular mound of earth and stones, about 40ft. in diameter and 6ft. high, near Foulford Bridge. On its north side a cist was found in 1864 containing a broken urn, and towards the south side a cist with an urn resting on fine sand mixed with pebbles, while a third urn was found near the centre of the mound. The urns were all small, and were not preserved. Last month, near the same site, in excavating for the new water system, a cinerary urn, 11½in. high and 9in. wide at the mouth, was found. It was inverted over the deposit of burnt bones, which lay in a heap on a slab of mica schist, the urn and bones being further protected by a large stone placed over them. About 2ft. distant and 1ft. under the surface a smaller urn was found mouth upwards, and containing cremated bones.

**Portsmouth Master Builders' Association.**—At a recent smoking concert at the Sussex Hotel a presentation was made to the late President, Mr. J. H. Corke, consisting of a solid silver Prince's bowl and centrepiece of classical design. Mr. C. Dye, the new President, occupied the chair, and mentioned that Mr. Corke commenced business in Portsmouth about twenty years ago as a contractor, and he had carried on an extensive business in the town ever since, amongst the buildings which were monuments of his work being the Central Hotel and the Empire Palace.

A FEDERATION of the West of England and South Wales master builders is proposed, and already a draft scheme has been submitted.

DEAN FARRAR has received a cheque for £200 to defray the cost of a screen in the crypt in front of Innocents' Chapel in the Cathedral.

THE first vote of £750 towards continuing the filling certain panels in the Houses of Parliament with frescoes, is due, we believe, to the initiative of Dr. Farquharson and Sir Charles Dilke. It is not yet decided whether or no the designs of Albert Moore will be utilised (those of Sir J. E. Poynter do not belong to the Government), so that there is still a chance of the money going in a commission to a living Artist.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two.

Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

**Editorial and Publishing Offices:**  
Effingham House, Arundel St.,  
Strand, W.C.

## Correspondence.

### ST. GEORGE'S CATHEDRAL, SOUTH-WARK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I wish to correct a remark made by the writer of the admirable treatise on Modern London Churches, in respect to St. George's Cathedral, Southwark. He says it was the prejudice and ignorance of the clergy (I presume he means in relation to Architecture) which prevented Pugin erecting a fine Cathedral on this site. Nothing of the kind was the fact. The clergy would have only been too pleased to have had Pugin's original grand design carried out, but they had to cut their coat according to the cloth, which in this case was money.

I remain, Sir,  
Yours faithfully,  
April 17th, 1897. T. WILLIAMS.

## TENDERS.

## TO BUILDERS, CONTRACTORS, and OTHERS.

**EAST ASHFORD UNION (KENT).**  
PROPOSED NEW ADMINISTRATIVE BLOCK, ADDITION TO INFIRMARY, NEW CHAPEL, AND ALTERATIONS TO EXISTING BUILDINGS, &c.

Persons desirous of TENDERING for the above WORKS are requested to forward me their names and addresses.

Bills of quantities will be supplied for a fee of £1 1s., which will be returned on the receipt of a bona-fide Tender.

The plans and specifications can be seen at the Workhouse, Willesborough, on and after APRIL 13th, 1897.

Sealed Tenders, on forms to be obtained of me, endorsed "Workhouse Buildings," to be sent to me on or before FRIDAY, MAY 7th, 1897.

The Guardians do not bind themselves to accept the lowest or any other Tender, and any Tender accepted will be subject to the approval of the Local Government Board.

No Tender will be accepted unless it comprises the whole of the Works.

HORACE HAMILTON, Clerk.

No. 11, Bank-street, Ashford, Kent,

April 7th, 1897.

## TO BUILDERS.

TENDERS are required for the erection of FOUR HOUSES at Felixstowe, being the first portion of a terrace in the development of the Eastward Ho Estate. Bills of quantities may be obtained on payment of a deposit of £1, which will be returned on receipt of a bona-fide Tender.

Tenders are to be delivered before TEN o'clock on TUESDAY, MAY 4th. The lowest or any Tender not necessarily accepted.

WILLIAM EADE, F.R.I.B.A., and  
E. THOS. JOHNS, Architects.

Cornhill Chambers,

Ipswich.

## FURTHER NOTICE.

**THE BOARD OF WORKS for the LEWIS-HAM DISTRICT.**  
KERBING, TAR-PAVING, METALLING, AND CHANNELLING WORK.

The Board is prepared to receive TENDERS for KERBING (with Aberdeen, Guernsey, or Norway Granite) and TAR-PAVING the FOOTPATHS, and CHANNELLING and METALLING the ROADWAY of Coombe-road, Sydenham.

The plan and specification of the work and form of contract may be seen at these Offices (Surveyor's Department), where printed forms of Tender and other particulars may be obtained.

The Tenders must be on the forms issued by the Board, enclosed in an envelope, sealed, and endorsed "Tender for Coombe-road," and must be delivered on or before FOUR o'clock on TUESDAY, the 4th MAY, at the Offices of the Board, and placed in the box there provided for the purpose.

The Board does not bind itself to accept the lowest or any Tender.

By order,

EDW. WRIGHT,

Board of Works Offices,

Catford, S.E.

April 21st, 1897.

Clerk to the Board.

April 15th, 1897.

**AUCTION SALES.****HARWOOD FARM BUILDING ESTATE, WATFORD, HERTS.**

Within half a mile of the High-street, and one mile of the Watford Junction Stations, London and N.W. Railway.

Important Sale of Freehold Building Land in a rapidly improving and increasing neighbourhood, suitable for the erection of a most lucrative class of Small Residences, Artisans' Dwellings, and Shops, for which there is great demand.

**MESSRS. HUMBERT, SON, and FLINT** are instructed by Messrs. BENSKIN, Limited, to SELL by AUCTION, at the Red Lion Hotel, Colney Butts, Watford, on WEDNESDAY, APRIL 28th, 1897, at Five o'clock precisely, about 420 PLOTS of FREEHOLD BUILDING LAND, most admirably situated, with frontages to good roads, and with depths varying from 100ft. to 140ft. The estate occupies an elevated position, has been most carefully laid out, and has immediate access to the centre of the town. The subsoil is gravel on chalk. The land will be sold free of Tithe and Land Tax.

Conveyances will, if desired, be prepared by the Vendors' Solicitors upon a moderate fixed scale of charges, and arrangements can be made for nine-tenths of the purchase-money to remain on easy terms, thus

affording opportunity for the smallest capitalist to acquire his own Freehold.

Particulars, plans, and conditions of sale may be had of Messrs. CROSSMAN and PRICHARD, Solicitors, 16, Theobald's-road, Gray's Inn, W.C.; of Messrs. SEDGWICK, TURNER, and ODDIE, Solicitors, Watford; and of Messrs. HUMBERT, SON, and FLINT, Watford, Herts, and 11, Serle-street, Lincoln's Inn, W.C.

**APPOINTMENTS VACANT.**

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ADCOCK, Mr. W. J., Builder, Dover.

"I have proved your invention easy of application. Both my joiners and apprentices could fix the apparatus without difficulty after having inspected a model."

CRICKMAY &amp; SONS, Messrs., F.R.I.B.A., London, S.W.

"The Patent Windows supplied for Sir Edward Walters' house at Salisbury gave us every satisfaction. We shall continue to use them."

JONES, Mr. PETER, Sloane Sq., London.

"I am glad to be able to bear testimony to the great utility and general usefulness of the N.A.P. Sliding Windows. I am very pleased with them, and should be sorry to be without them."

LUCAS &amp; AIRD, Messrs., Contractors, London.

"Cheap, simple, and effective. We are using some 1200 sets of your fittings on these exceptionally tall buildings."

MORGAN, ISTD &amp; MORGAN, Messrs., Contractors, Southampton.

"A very clever arrangement, and one which will certainly come into daily use."

PERRY &amp; READ, Messrs., F.R.I.B.A., London.

"It is with pleasure that we are able to inform you of our entire satisfaction with the 'N.A.P. Windows,' we shall continue to specify them."

Write for Full Particulars to the N.A.P. Window Co., Ltd., 159, Victoria Street, Westminster, S.W.

CONTRACTS OPEN.

HORNSEY URBAN DISTRICT COUNCIL.

TO ROAD AND SEWER CONTRACTORS.  
The Hornsey Urban District Council are prepared to receive TENDERS:

1. For the CONSTRUCTION of about 3000ft. of new 9in. STONEWARE PIPE SEWERS, with Man-holes, Gullies, &c., and about 1300ft. of new 6in. STONEWARE PIPE CONVECTIONS, in and near to Nightingale-lane, Hornsey; and
2. For SEWERING, LEVELLING, PAVING, METALLING, CHANNELLING, and MAKING-UP St. Ann's-road (2nd Section), Hornsey.

Plans and specifications may be seen, and forms of Tender and all information obtained, on application to Mr. E. J. LOVEGROVE, Engineer to the Council, at the offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of Two Pounds in each case being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a bona-fide Tender is not made by the Depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted such sum will be retained by the Council until the contract has been executed by the Depositor, and will be forfeited in the event of his, or his sureties, failing or neglecting to execute such contract, or the bond accompanying the same, within seven days after he or they

respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form.

Sealed and endorsed Tenders are to be deposited in the Tender-box in my department not later than FOUR o'clock on MONDAY, MAY 10th.

The Council reserve to themselves the right to decline all, or any, or any portion of the Tenders so sent in.

By order of the Council,

F. D. ASKEY,

Clerk to the District Council.

Offices, Southwood-lane, Highgate, N.

April 21st, 1897.

## GREEN'S PATENT TRUINVERT PIPE.

AA—Holes for pouring in cement or composition.  
—Strengthened and Lengthened Socket.

CC—Inner Socket and Rest.  
EE—Chamber for cement or composition.  
FF—Stanford Joint in new position.

This pipe secures TRUE ALIGNMENT OF INVERT, INCREASED STRENGTH IN THE SOCKET, THREE GAS AND WATERTIGHT CONNECTIONS AT EVERY JOINT, and while allowing for a slight settlement when first laid, forms an ABSOLUTELY RIGID JOINT directly the cement sets.

### POINTS.

- 1.—GAS AND WATER-TIGHT JOINTS EASILY MADE UNDER WATER.
- 2.—TRUE ALIGNMENT OF INVERT.
- 3.—SOCKET THE STRONGEST PART OF THE PIPE.
- 4.—NO SPECIAL JUNCTIONS REQUIRED.

OATES & GREEN, Ltd., Halifax.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

BY ALEXANDER DREW.

STILL assuming that whatever loads are applied to the roof truss they always occur at the joints, and thus do not give rise to cross bending, it will be readily seen that the two forms of members, struts and ties, must be treated on different lines, to determine their scantlings. A tie (or a member under tension) is much the simpler to deal with, for the cross-section required is in nearly every case directly proportionate to the stress it has to resist, and is independent of the length of the member. In the case of round ties, the ends are formed into jaws or eyes, so proportioned that the strength throughout the full length of the bar is practically the same. In such a case it is only necessary to settle on the maximum stress allowable per square inch, and to divide the total stress by this value, to get at the sectional area required. It is sometimes the case, especially in small spans, that these ties are formed of flat iron bars; this point will be taken up later on.

Struts, or members under compression, do not act in the same way as ties, and require very different treatment in calculating the section necessary to suit any given condition. If the strut (or pillar) be very short, and a steadily increasing load is applied, it will eventually yield by crushing; but should the length be great in proportion to the diameter, it will yield first by bending. Thus, imagine a straight piece of wood of reasonable length set upright on some stand, the upper end passing through a guide, so that it can move freely up or down only; this will represent a strut or pillar; if a light weight be now placed on the top end, and a small side pressure applied about the middle of the length, this pillar will bend slightly, but on the side pressure being removed it will again resume its original straight form. If the load be increased and the same experiment tried, it will probably be found that the bending now takes place much readier, and the tendency to return to its original condition is not so marked. On gradually increasing the load, a point will be eventually reached where this pillar may be said to be in a state of uncertain balance, so that a slight side pressure will cause it to bend as before, but it will not now resume its straight condition on the side pressure being released; any load above this value will cause failure by the pillar collapsing altogether, and this failure will be almost entirely due to the stress caused by the bending. The tendency which the pillar at first showed to resume its original straight

position was due to the fact that when any bending took place, the material on the inner side of the curve was compressed, while that at the outer side was extended or stretched beyond its original condition, and the elasticity of the material, which tended always to return it to its original state, caused this straightening immediately the bending force was removed. Whenever the stress due to the load becomes equal to the elastic resistance of the material, recovery does not take place, and this was the condition of matters when the state of balance just noted occurred. The stresses due to bending increase very rapidly as the pillar departs from the straight line, and it is to this cause almost entirely, and but very slightly to the direct stress on the material from the supported load, that failure is actually due.

But the actual strength of a pillar depends, to a considerable extent, on the manner in which the ends are set or fixed. Should these be practically free to turn, the curve taken by the pillar on yielding would be more or less a regular arc of a circle, as represented in outline at A, Table II. Should the ends, however, be rigidly fixed, the curve will now assume somewhat of the formation shown at B, where the centre curve is connected with the ends by short reverse curves; the greater stiffness due to the fixing of the ends necessarily implies greater strength of pillar. An intermediate condition to these is shown at C, where one end is assumed as fixed, while the other is free or rounded. Time will not permit of any investigation as to the proportionate strengths for these forms; Table II., to be presently described, gives the strengths for the two conditions A and B, that is to say, for "round-ended" and for "fixed-ended" struts or pillars; and the intermediate condition, C, may be assumed as occupying a mid-position between these two extremes.

The strength of long struts or pillars is largely dependent on the shape or cross-section of the member; it is really closely proportionate to a certain mathematical function of the section, called the Radius of Gyration. This value is in most cases rather difficult and troublesome to calculate, and for practical purposes it may be got rid of by making use of some simpler value, and correcting this by means of a series of calculated co-efficients. The Table of Strength of Struts (II.) here given shows such a means of simplifying these calculations (based on a somewhat similar table given in Rivington's "Building Construction," Part IV.), and by it can be got the safe stress per square inch which may be allowed to come on any pillar or strut, for varying lengths, cross-section, and material. The vertical heights measured to the particular curved line gives the safe stress, while the horizontal distances take into account the length and cross-section of the member; that is to say, the numbers along the foot of the diagram represent the value of the length of the member divided by its least radius of gyration. If the member be of irregular shape and free to bend in any direction, it will, of

course, yield in its weakest direction, or in the direction in which the calculated radius of gyration is least: hence the use of this term, *least radius of gyration*. The notes on the table generally describe the same, so that it should only be necessary to give a few hints here, and take one or two examples, to make quite clear how such is to be used. The small table gives the calculated values for (n) for various sections, and is used in determining the approximate value of  $\frac{1}{r}$ ; should the particular section used not be exactly any of these given, an intermediate value may be readily got at, sufficiently near for practical purposes. The curves of strengths for the three materials, mild steel, wrought iron, and cast iron, and for the two conditions of round ends and fixed ends, are drawn and marked. If, then, it is desired to determine the strength of a 3in. x 3in. x  $\frac{3}{4}$  x 6ft. long T iron strut, the calculations are as follows:—

Assuming that it is free to bend in its weakest direction, the highest value of (n) must be taken, or 4.9.

Thus the formula is:  $n \frac{1}{b} = 4.9 \frac{72}{3} = 117.6$ .

Taking the nearest value to this (120) on the line of figures at bottom of diagram, the eye is run upwards till it meets the full line marked wrought iron, when it is then carried along the horizontal line which intersects the same at this point, and the value of the safe stress is read off; in this case, for round ends, the desired stress is 1.54 tons. Should the strut be a fixed-ended one, the eye would have been carried upwards till it met the curved-dotted line marked wrought iron, and the value level with this point, or 2.80 tons, would then have been read off. In the same way, if the strut was of mild steel, the corresponding values would have been 1.82 and 3.45 tons respectively. With these safe stresses determined it is only necessary to multiply them by the area of the strut in square inches to get at the total safe load. This same operation could be gone through for any length, or section, or for any of the three materials noted in the diagram, the result in each case being the safe stress per square inch.

Many cases may occur in practice where considerable care must be exercised in determining the correct value to employ for (n); this value, of course, depends on the direction in which a non-symmetrical strut yields. For example, the rafter in a roof truss may yield in a vertical direction between any pair of joints; but it is also liable to yield in a horizontal direction between the points of connection with the purlins; the difference in length between these two set of points, and the different value of the radius of gyration under these two conditions (or if the table of values of (n) be employed, this value is, of course, considered as a substitute for the radius of gyration) must both be considered to determine the weakest direction, and consequently the direction in which the safe strength must be calculated. In the same

 Rough value of  $\frac{l}{r}$   
 $= n \frac{l}{b}$

Note: - This diagram is drawn for a factor of safety of 4.

way a strut may be so fixed at its ends that the liability to bend in one direction is greater than in another, or, as it is usually termed, it is restrained in one direction; and, of course, the same considerations must be applied in this case. It is for this reason that the two values of (n) marked \* are given; and, as noted, these must be used when the bar is free to yield only in what would ordinarily be called its strongest direction.

It is scarcely necessary to add that the diagram given may be used for any section of column or strut whatever, provided the value of the radius of gyration be known; and it may be well to note here that the rough method given of determining the value of  $\frac{1}{r}$  should only be used when the correct value of the radius of gyration is not available, or when only an approximate answer is sufficient.

It should be noted that the safe crushing stress, or the safe stress which should be allowed to come on very short struts or pillars has in this table been taken at about 9 tons for cast iron, about 5½ tons for steel, and 4 tons for wrought iron; should any other value for this safe stress be determined on (that is to say, should some other factor of safety be made use of), the corresponding strengths can be readily got by proportion from this table.

A careful study of the curves of strength given indicates several points worthy of note, but these can be little more than mentioned here. As previously pointed out, a very short strut yields by crushing, and therefore its strength is directly proportionate to the area of its cross section only; this is brought out by the two curves for the Wrought Iron and Mild Steel struts meeting at the levels representing the 4-ton and 5½-ton stresses. Again, it may be noted that the two lines for Wrought Iron and Mild Steel are furthest apart about the middle of the diagram, indicating that the difference in strength between a round end and a fixed end pillar is greatest where the proportion of length to Least Radius of Gyration is roughly 150; while again these lines begin approaching one another as this value is exceeded. This is quite to be expected, since it is evident that in the case of very long struts the fixing of the ends is by no means so efficient in stiffening the member as is the case with shorter struts. Again, it will be noticed that the Steel and Iron lines seem to rapidly approach one another as they are extended towards the right, showing that the difference in material has less and less effect on the strength of the strut as its length is increased. A little consideration will show that this also is a natural result, for, if the failure of long struts be largely due to the stresses induced by bending—and this yielding occurs whenever the elastic strength has been exceeded—the fact that this elastic strength of Steel and Wrought Iron differ but little from one another necessarily implies that the strengths of struts of these two materials will approach nearer and nearer to one another as the proportion of length to width is increased.

In such a table as that just described it is comparatively easy to determine the necessary length for any particular strut or column under the length, load to be carried, shape of the cross section, and the manner in which it is fixed at the ends has been determined.

We are now in a position to take up some simple type of roof truss, and consider how the stresses and sections will vary with definite variations in the proportion. Table III. has been made up in the following manner: the simple type illustrated has been chosen, four variations in rise or slope of rafter have been taken, and the outline for each drawn. The rise is one-third, one-fourth, one-fifth, and one-sixth that of the span, and it has been assumed that the covering in each is of the same nature, and that the same horizontal wind-pressure has been acting. The total dead load values noted are nearly proportionate to the different lengths of the rafters in each case, the pitch or distance apart of the trusses being, of course, assumed as the same (10ft.) throughout. The variation in the live load values given are due to the change in the slope, and the consequent alteration in the equivalent normal pressure (see Fig. 1). Two

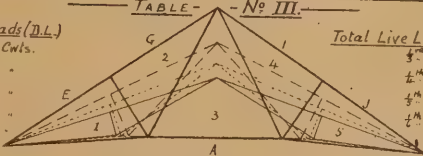

sets of diagrams were drawn (exactly as in Figs. 16 and 17) for each of the rises before noted, but the dead load and live load in each case are taken as equal to unity; the lengths of the several stress lines thus gave the multipliers noted in the first table (a). The corresponding total dead and total live loads were then in turn multiplied by their corresponding multipliers, and thus the dead and live load stresses noted in the table (b) were got at. The third table (c) gives the total stresses on each member, these being the dead and live load stresses in the previous table added together. The next table (d) introduces a little complication, and is intended to bring out the proportionate weights of the four forms of truss. For the ties A 1, A 3, and 2 3 the total stress noted in the previous table for each of these members is divided by twenty to reduce it to tons, and by five (the assumed maximum safe tensile stress), and multiplied by the length of the member in inches, the result being the theoretical number of cubic inches in the particular member; this is called the theoretical bulk. The struts, however, must be treated in the manner explained while describing the use of the table of the strengths of struts, so as to determine the safe unit stress (or safe stress per square inch of section) to which they may be subjected. This value being found it is made use of in the same way as the previous 5 was for the ties, the total stress being divided by this value and multiplied by the total length of the number in inches to get at the theoretical bulk. Throughout this table the rafters have been assumed as 4in. by 4in. ties, the thickness being proportionate to the stress they have to sustain, while the struts are in their turn assumed as 3in. by 3in.; all members being wrought iron. It is also worthy of note here, that in calculating the safe stress for the rafters the half length must be taken, or the distance between the centre joint and the shoe; and as the rafter is in one length throughout and is fixed both at apex and at shoe, it has been treated as a "round and fixed end" strut—the full length, of course, must be used in getting the bulk; the struts have throughout been treated as "round ended." The totals got in this table will thus represent the proportionate weights of the several trusses, and no attempt is made to carry matters further at this point; for, though it is only necessary to multiply this theoretical bulk (which is in cubic inches) by the weight per cubic inch to get at the theoretical weight, little advantage would be gained. No allowance has been made for the extra lengths of the bars beyond the points

of intersection of the members shown on the skeleton outline, nor has any notice been taken of the material required to form the several ends or junction plates; the theoretical weight might require to be multiplied by 2 or 3 to make allowance for all this.

If it be allowed as sufficiently near for present purposes, that the cost of these trusses will also be proportionate to their weights, it is only necessary to assume an approximate value for any one to get at the proportionate approximate values of the others. This is detailed in the next and last table (e).

(To be continued.)

CONSIDERABLE improvements have been carried out in Blairdaff Free Church. The interior of the building has been wholly gutted out and re-floored. New seats, in pitch-pine and varnished, have been erected, and a heating apparatus, with hot-water circulation, has taken the place of the former stove. The contractors for the works were: Mr. Buehan, builder, Monymusk; and Messrs. Laing, Inverurie.

## THE DISPOSAL OF SEWAGE.

By W. HARPUR.

IN continuing the series of lectures on sanitation, given at the University College, Cardiff, the lecturer, Mr. W. Harpur, the Borough Engineer of Cardiff, spoke on "Sewerage and Sewage Disposal." In the course of his remarks, he said that in Great Britain there was but little attempt at sanitation until the passing of the Public Health Acts of 1847 and 1848, which gave a stimulus to sanitary works, and the amendments which had since been passed to those Acts had done much to improve the sanitary condition of our towns. But there was even yet great room for amendment and improvement in our sanitary laws before a state of perfection could be looked for. He maintained that a proper system of sewers for a town or populated district should provide for (a) the drainage of the surface, (b) the drainage of the sub-soil, and (c) the removal of excrementitious and refuse matter; and in

## SEWERING OF TOWN OR VILLAGE

four points should be observed—(1) the drains should be designed of sufficient size to effectually accomplish the work required of them; (2) they should, if possible, be laid at such gradients as to be self-cleansing; (3) they should be so constructed as to be easily examined at any time; and (4) they should be efficiently ventilated. Having enlarged at some length upon these points, Mr. Harpur illustrated by means of several sheets of drawings some old and bad forms of sewers and some modern-shaped sewers, and, passing on, spoke of the importance of sewer ventilation, and exhibited models of ventilating cowls. As to the Keeling-Holman patent sewer-gas destructor, he considered that these ventilators might be effective in their work, but their universal application to the entire sewerage system of any large town would, he feared, entail too large an expenditure to warrant their adoption. Their adoption in Cardiff, he roughly estimated, would cost about £11,000 per annum (estimating the first cost at £16,000), and this expenditure he considered would not be warranted just for subduing an occasional bad smell here and there in some of the streets. Personally, he favoured street surface ventilators, and sewers well flushed and ventilated should not prove a nuisance. Dealing with sewage disposal, the lecturer unhesitatingly condemned the earth, the cesspool, and the midden systems, and said that of the numerous methods advocated and in operation, the three best known were (1) precipitation and filtration, (2) discharge into the sea, and (3) the application of the sewage to the land. He considered that chemical treatment generally was a costly, troublesome, and at the best an unreliable and inefficient method of disposing of sewage, and he would never advocate the adoption of precipitation where either of the other two methods were available. Discharge into the sea was, to towns on the seaboard,

## AN EASY AND EFFECTIVE METHOD,

but, nevertheless, one which required to be carefully carried out. Opponents of such a practice often seemed to forget two important facts, the vastness of the ocean, and the insignificance of the sewage in comparison with its volume; and that seawater cannot be used for diatic or domestic purposes. Turning sewage water into the sea was like turning sewer gas into the air. We have only to place the point of discharge in such a position as not to be objectionable, and the elements would accomplish the work of purification more perfectly than any invention of man. Having described the various forms of applying sewage to land, the lecturer directed attention to the septic tank system of sewage treatment, which was the result of a series of experiments carried out by Mr. Donald Cameron, the city engineer of Exeter, and the object of the system was to purify sewage by natural means, and avoid the cost entailed by artificial treatment. By the use of these septic tanks the

micro-organisms were used for accomplishing the same, and, indeed, a much further object than the use of chemicals could, for it aimed at consuming, by means of micro-organisms, all decaying animal and vegetable matters, including their own products. So far, the experiments conducted with this system appeared to be highly satisfactory, but whether its application would prove as efficient in all cases remained to be seen, and it would be particularly interesting to know what the result might be where refuse from manufactories, such as might be injurious to the life of micro-organisms, was admitted into the sewers.

## Surveying and Sanitary Notes.

THE question of the drainage of St. Budeaux has been receiving the attention of the Plympton Rural District Council for a period of something like eight years. The extensive building operations that have been carried on in the district for the past twelve months have made the situation one of extreme danger. A more disgraceful state of things than that revealed to our representative, who made a tour of the parish, it would be difficult to find in any other part of England. Indeed, the observation was made by one who is affected, and who has had a lengthy and varied experience in other countries, that the sanitation of St. Budeaux could only be compared to that which exists in countries like Arabia or Persia. In close vicinity to the railway station is an area of land partly covered by attractive-looking, newly-erected houses, and in their rear rows of other dwellings of smart appearance are being built without loss of time. At a moderate computation it may be said that there are already in residence in the block about a thousand people. The general system adopted is that of laying a drain through each of the back lanes, with connections to every house that abuts thereon, and emptying the sewage into cesspits. These cesspits are of varying size and character, but we believe that, with only one exception, has any been provided with the ventilating pipe to carry off the fumes. The seriousness of this will be recognised when it is pointed out that the pits are scattered about at different points within the building area, and are not only unprovided with overflow pipes, but are cleaned out only at very long intervals. In one case there is a drain which does not extend quite the full length of the terrace, but ends about fifty yards from its termination. The position of the pit is marked by a heap of stones, which has been placed over a covered grating to prevent the sewage becoming visible.

THE Whitehaven Rural District Council having applied to the Local Government Board for sanction to borrow £1300 for works of sewerage and sewage disposal for the parish of Distington, the Local Government Board Inspector, Mr. W. O. E. Meade-King, M.Inst. C.E., has held an inquiry.

An inquiry was held at the Town Hall, Ipswich, as to the Corporation's application to the Local Government Board for sanction to borrow the sums of £7000 and £5870 for works of sewerage and wood-paving. The Town Clerk said the district to be sewered was an important suburb of Ipswich, and the Medical Officer of Health had several times called attention to the need for a sewerage scheme for the California district, which was now very largely drained by dead-wells. The soil was of a porous nature, and this would be another step towards doing away with the earth closets. The scheme had been under consideration for two years, and all the members of the committee had had great experience in the matter of sewerage. The scheme was believed to be the best possible scheme to meet the requirements of the district. The objection to be offered was as to

the point of discharge, but they had never been troubled with flooding below the Gas Works. The discharge of storm water would be considerably in favour of the new scheme.

A LOCAL Government Board inquiry has been held at the Town Hall, Leicester, by Col. A. G. Darnford, R.E., in reference to an application by the Town Council for sanction to borrow £1448 for the purchase of land for street improvements in St. Nicholas Street, West Bridge Street, and Granby Street. The Town Clerk said the sum the Corporation wished to borrow was made up of £1018 for St. Nicholas Street, £330 for West Bridge Street, and £100 for Granby Street. With regard to St. Nicholas Street, it was at present extremely narrow, the width varying from 20ft. to 25ft. It would form the chief road to the new station of the M.S. and L. Railway Company, and as the company was making a new street 50ft. wide, which would lead into St. Nicholas Street, the Corporation was anxious to make that thoroughfare of the same width. The West Bridge improvement consisted in the purchase from the M.S. and L. Company of two pieces of land, which at present projected. The company had widened the street at that part, and the Corporation had agreed to buy this surplus land at £3 15s. per yard. In Granby Street a hotel was being converted into shops, and the Corporation was anxious that they should not be built up to the front of the street, so, by paying £100, it came to an arrangement whereby the frontage would be set back to the line of the adjoining premises.

A SUPPLEMENTARY water supply will shortly be turned on at Melrose. This supplementary supply, together with the supply from the Eildon Hills, the works for which the Commissioners acquired from the Melrose Water Company, will secure to the burgh an abundant supply of pure spring water. The water from the different springs is conveyed in fire-clay pipes with water-tight joints to regulating chambers. There are three of these chambers on Allanshaws, connected by 5in. diameter cast-iron pipes with lead joints, and they are so arranged and fitted with ball valves that the supply of water from the lower springs is sufficient for the requirements of Melrose, the water overflows from the upper one at the north end of Allanshaws into the Ewlyn Burn. The water from the lower regulating chamber is conveyed to a service reservoir south of Melrose in a cast-iron main, consisting of 5in., 6in., and 7in. diameter cast-iron pipes. The line of the main practically follows the course of the Ewlyn Water till it reaches a point short distance to the south of Woopla Bridge. Owing to the height of the source above Melrose, it was found necessary to break the pressure, and this is done by a break pressure chamber situated on the summit of the public road about a quarter of a mile to the south of Glendearg farmhouse. This service reservoir, the water level of which is below the level of the natural surface of the ground, is constructed of concrete, having a semi-circular roof, and the whole covered with soil, so that the change in temperature in the atmosphere cannot affect the water in any way. It is 100ft. long by 24ft. wide, and has a depth of 10ft. of water, giving a capacity when full of 150,000 gallons. Owing to the height of the service reservoir, the pressure in the main at Darnick would be too great for house fittings, and in order to reduce the pressure to a proper working head the water passes through a pressure-reducing valve enclosed in a chamber, before entering the distributing pipes. In addition to the distributing pipes in Darnick and the west end of Melrose, several of the original distributing pipes throughout the burgh have been renewed and extended, and otherwise put into thorough repair. A number of stop-valves and fire-plugs have also been introduced on the original pipes, so that the water system throughout the burgh is now most complete. The total cost of the scheme will be about £10,000. The engineers are Messrs. Belfrage and Carfrae, Edinburgh.

THE Victorian  
"Jubilee Art." Loan Exhibition  
now open at the

Guildhall consists of "works of the British School by painters who have flourished during Her Majesty's reign." The description is from the catalogue; otherwise one would hardly speak of Frederick Walker, Cecil Lawson, and the struggling rank and file of the pre-Raphaelites as "flourishing" painters at any time; and it is doubtful whether H. H. La Thangue, George Clausen, and J. Aumonier would care to be labelled "British School." But the strength of the Exhibition is in the richness and variety of the sources from which it is drawn, and the rare justice it does to certain phases of mid-century Art which have outwardly come to nothing, but yet have contributed something vital and permanent to that which superseded them. The purely experimental pre-Raphaelitism, for instance, identified with the early work of Rossetti, Millais, and Holman Hunt, did not perish with their transition to other modes, but was developed with admirable results by a group of men almost unknown to the present generation—Arthur Hughes, W. S. Burton, Frederick Sandys, Frederick Shields, Henry Wallis, W. S. Windus, Charles Collins, R. B. Martineau, and the one landscapist of the School, Mark Anthony—of whom only the first three are represented here. It is regrettable that none of the greatest works of Sandys, such as the "Medea" or "Morgan-le-Fay," could be included in this collection, though the "Harald Harfage" is characteristic and powerful; but one must rejoice to see again the beautiful "April Love" with which Arthur Hughes promised such superb and alas! unaccomplished things. W. S. Burton's "Cavalier and Puritan," too, is one of the finest of that group of historico-romantic genre-pictures in which Holman Hunt and Millais led the way. The last-named Artists are represented by the well-known "Huguenot," "Chill October," "Ferdinand Lured by Ariel," "The Blind Girl," "Two Gentlemen of Verona," and "May Morning on Magdalen Tower." Of Rossetti we have "The Beloved, or the Bride"—poor in conception, but belonging to his very best period in technique; the somewhat decadent "Fiammetta," and the best of the several versions of "Mary Magdalene." "The Last of England" is the sole and splendid example of Madox Brown. Among the older and more conventional painters we find Constable, David Cox, Sidney Cooper, Landseer, Linnell, Maclise, Mulready, Webster, Wilkie, and others. There are two or three Turners, a small but precious overflow from the Watts exhibitions, and some excellent examples of Alma Tadema, Burne-Jones, Orchardson, Colin Hunter, Albert and Henry Moore, John Brett, B. W. Leader, and Lord Leighton; also Frank Dicksee's "Romeo and Juliet" (too late for the catalogue), and one of the very few fine portraits that Hubert Herkomer has given us. The newer portraiture finds expression in John Sargent's "Mrs. Hugh Hammersley," and the younger landscapists in Alfred Parsons, E. A. Waterlow, Alfred East, and Adrian Stokes. Frank Bramley's "Hopeless Dawn" and a fishing scene by Stanhope Forbes are fairly representative of the Newlyn School. Altogether the collection

yields a very interesting study of English Art during the past sixty years, and that such an Exhibition does not lack popularity is evidenced by the unusually large number of visitors who have flocked to the Guildhall. The Summer Exhibition at the New Gallery, Regent Street, sustains an unusually high average of excellence, without affording many memorable "pictures of the year." Of these, the chief will perhaps be "The Vampire," by Philip Burne-Jones—not so much through its intrinsic merit as through the grimly powerful ballad written for it by Rudyard Kipling in the catalogue. The "Lullaby" of Charles E. Stewart, blending cold twilight with the rich glow of a fire in the manner which we are too apt to identify with the Newlynites, has a grace and freshness quite its own; and W. Llewellyn has broken fresh ground in "An Old Garden"—a somewhat

The Architectural  
Association's  
Jubilee.

WE are accustomed somewhat to regard the Architectural Association as a new thing, as a latter-day development. Its atmosphere is so much that of the irresponsibility of youth, its assumptions of importance and attitudes of wisdom and gravity so much a mere overlaying of a lively juvenility, that is ever cropping out to manifest itself, and the pose of Guardian Angel which the Institute is wont to strike in regard to it, and the ready acceptance of the Association of that relationship, all tend to keep us from remembering what a very real and living impulse the Architectural Association is to the dignity of the profession. Now, however, there is to be no more doubting the reality and importance of the Association. There has lately been published, and come under our notice, the

ROTHERHITHE TOWN HALL. PORCH AND DOORS TO MAIN ENTRANCE.  
MESSRS. MURRAY AND FOSTER, ARCHITECTS.

thin and misty vision of eighteenth-century gowns in the grass, but admirable in composition and feeling, and interesting as a departure from his usual portrait-painting. J. W. Waterhouse is in his happiest mood; his "Marianna in the South" is, indeed, the gem of the Exhibition, and for sincerity of spirit and purity of colour equals anything we have yet had from the same hand. The painter has returned to his favourite model—the frail, lank-haired sitter for "Ophelia" and "La Belle Dame sans Merci"—but her type exactly suits his method, even the looking-glass effect does not seem in the least degree hackneyed or forced. Neither Sir E. Burne-Jones nor Walter Crane is seen to advantage. The portraits are not remarkable, save the few by John Sargent and J. J. Shannon, which, of course, must not be missed; and G. Spence-Watson has a wonderfully fine character-study of "Une Femme du Peuple." A somewhat unfortunate accident occurred on the day of the private view, when a piece of statuary placed in the hall was knocked down and badly damaged.

"Jubilee Number of Architectural Association Notes," the monthly organ of the society, and the meaning and import of this publication, all salmon-tinted and gilded, is that the Architectural Association has with this session completed the fiftieth year of its organisation. The origin of the Architectural Association, however, was made upon a different basis to that upon which it now stands. In its beginning, in the autumn of 1846, it called itself an "Architectural School of Design," the chief motive of which was design and mutual criticism. The Society met every evening (except Saturday) for study from 7 to 10, and every member was required to produce an original design every six months. Mr. Phénè Spiers, in writing his recollections of these early days (1856), when he himself was a student at King's College, London, says that, as a rule, the designs were rendered in sketch perspective only, and he quotes a former chairman, as saying of a certain design that it was "more than a sketch, as it was a small plan with a very pretty coloured perspective!" Architects of standing directed the evening

studies of the members, but it was not till some years later that plan, section, and elevation supplanted the primitive designs in "very pretty coloured perspectives." In 1857 Mr. Ruskin gave the address at the conversazione, which, at that time, only differed from the ordinary general meetings in that it was better and called a larger attendance. It was in 1856 that the Institute made proposals for the Association to sink its individuality and to enrol its members as students of the Institute. This was declined, although at the time the Association was in financial difficulties and the number of its members was falling off. The following, quoted from the regulations drawn in 1847, speaks eloquently for the primitiveness and precariousness of the Association in those early days: "The annual subscription is ten shillings payable quarterly." It is really, however, within the last five years that the step has been taken, by the organising of proper classes, studios, and lectures, that has established the Association, unequivocally, as one of the most important professional institutions. Five years ago the Architectural Association was only different from the Architectural Association of twenty-five years ago in its size and its influence; its scope and its intention stood unchanged. There was a confusion in the various classes of design and a laxity on all sides. The very size of the Society precluded that social and personal spirit of mutual improvement, mutual admiration, which, in its earlier days, formed its real impulse. The classes, as now arranged, have also done away to a great and beneficial extent with the "Class Secretary." This species was very numerous in the old days, every class having two or three to arrange and organise as need arose, and the majority of these had no other view but to become official by persistency of officiousness; they lived for the ultimate chair of the presidency or some other secondary post. Mr. Aston Webb, in prognosticating the future of the Association, as we read him within these gilded salmon-coloured covers, gives a wise admonition when he reminds the Association that it would be fatal to all its prosperity and its ultimate possibilities to attempt to compete in its classes and lectures with those which, by its example, are now springing up all around. The vital spark of the Association lies in its social aspect as apart from its educational, and its past success has been in this, that it has acted independently on its own convictions, under various exigencies, and has kept clear of any avowed policy or hard and fast scheme, or formulation of its intentions and limits. We cannot offer the Association better advice than this, to which we add our congratulations on its fiftieth birthday, and our best wishes for its future.

DUNBAR Parish Church has just been reopened after undergoing extensive renovation, at a cost of £4500.

A NEW public school for the Garngad district has just been opened by the School Board for Glasgow. Exclusive of the cost of site, the amount expended upon the school has been about £13,000. Places are provided in the school for 1200 pupils.

THE foundation stone of Glasgow Bridge, laid in 1833, and now being rebuilt, was discovered by the workmen some days ago. In appearance the stone is as fresh and clean looking as if it were but newly laid. Messrs. Gibb, Aberdeen, were contractors for the erection of the bridge.

A NEW organ has been erected in the Parish Church of Thornton, near Bradford, the birthplace of Charlotte, Emily, and other members of the Brontë family, to perpetuate the memory of the gifted sisters. It is a beautiful instrument, and has cost about £1000, the builders being Messrs. Harrison and Harrison, of Durham.

#### AN OLD CITY TAVERN.

FEW of those who hurry daily along Cornhill turn down the little alley by St. Michael's Church. St. Michael's Alley it is called now, but in old times it was known as Long Alley. Many who used to frequent the barred-up Cock Tavern will feel a pang of regret now that that ancient tavern is shortly to disappear. The curious wayfarer, however, has long known St. Michael's Alley as the place where the first coffee house in London was started—here where the now doomed Cock stands—the first of the famous series whose names are household words in the history of the eighteenth century; names which at once remind us of those of their famous *habitues*. Garraway's, in Change Alley, recalls Swift; Will's, and Button's, and Tom's immediately suggest Addison and Steele, Pepys and Pope,

ROTHERHITHE TOWN HALL.

CARYATIDE. MAIN ENTRANCE DOORWAY.

Colley Cibber and Davenant. It is probable enough that Pope frequented the coffee houses in Change Alley and St. Michael's Alley, for his parents lived hard by in Lombard Street, where he himself was born. Be this as it may, the Cock, which now stands near the Church of St. Michael, and opposite to the very churchyard where Rosee's rival pitched his tent, must have received within its doors many a generation of tavern frequenters. It was, presumably, the direct successor of the original coffee house, which was, of course,

#### DESTROYED IN THE GREAT FIRE

only a few years after Pasqua Rosee first brewed the berry for his eager customers. St. Michael's Alley was in those days called the "Longe Ale." At its entrance was a gate, and near it were two crosses. The churchwardens of the year 1460 recorded having paid

twopence for two crosses "standyng atte aley gate." In 1551 the then churchwardens invested twenty pence in "two newe lanternes, one for the Aley and one for the cloister." Of the antiquity of the Church, beneath the shadow of which were eventually to be established the famous early coffee-houses, there is ample record. Ten years before the Conquest Alnod the priest is on record as having presented the Church of the "Blessed Michael in Cornhulle, London," to the Abbey of Evesham; and to that great Abbey it continued to belong until, in the time of Henry VII., it was transferred to the Drapers' Company, its present possessors. The steeple was rebuilt in 1421, and repaired in 1551 and 1574. Stow, in his "Survey of London" (ed. 1603) has the following story about St. Michael's steeple:—"And here a note of this Steeple as I have oft heard my Father report. Upon S. James' night certaine Men in the Lofte next under the Belles ringing of a Peale, a Tempest of Lightning and Thunder did arise, an ugle shapen sight appeared to them coming in at the South Window and lighted on the North for feare whereof they all fell downe and lay as dead for the time letting the Belles ring and cease of their owne accord. When the Ringers came to themselves they found certaine stones of the North window to bee rayssed and scat (scratched) as if they had been so much butter printed with a Lyons clawe; the same Stones were fastened there againe and so remayne till this day. I have seene them oft and have put a feather or small stick into the holes where the Clawes had entered three or foure inches deepe." What became of those stones scored so deep with the devil's claws? Are they in the tower still? Or did Sir Christopher's builders, with the lofty scorn of their more enlightened age, toss them aside as superstitious rubbish? There, beneath the lofty tower, still lingers for a few weeks more—or, perhaps, days only—one of the last of the

#### OLD-FASHIONED TAVERNS OF THE CITY.

Its plain, symmetrical front and the woodwork of the lower story tell of its eighteenth century origin, or of the closing quarter of the preceding century, and the fittings of the interior are, or were, of the same period, straight-backed wooden settles, panelled doors and cupboards, shelves of generous width supported by ornate brackets and capable of sustaining much crockery, soup bowls, punch bowls, and the like, and an octagonal clock with the curling volutes to support it in strict keeping with all the rococo ornamentation of the place. The staircase, as usual in the domestic Architecture of the period, is of admirable design and solid workmanship. The newel posts are massive, and the balusters are of a simple but effective pattern, too rarely seen in our houses to-day. The staircase of the Cock is the model of what a staircase in a confined space should be. It is too good to be used for lighting fires. But "Ichabod" is written upon the walls. Great commercial establishments have been rising up all around for many a year, threatening to swallow up all eligible sites that came in their way. The fate of the Cock was a foregone conclusion. Down it must come, and another link which binds us to the old tavern life of our forefathers will be snapped.

A SERIOUS explosion has occurred at the Phoenix Bessemer Steel Works at Rotherham. The large blowing-pipe, which works the steel converters, burst, doing much damage.

THE Staffordshire General Infirmary at Stafford, which has undergone complete reconstruction at a cost of about £20,000, has just been re-opened. The infirmary itself dates from the year 1766, but the building which has just been practically rebuilt was about seventy years old.

THE Archbishop of York has handed over, as a memorial of the late Archbishop Thomson, a handsome old Jacobean pulpit of carved oak, which had long formed part of the appointments of the Primate's chapel at Bishopthorpe. It has been erected in the parish Church of Rotherfield, Sussex.

## Rotherhithe Town Hall.

**T**HIS is the latest of a series of Town Halls in London districts such as Battersea or Kensington, which will, we think, compare favourably with any building of its class.

Owing to the nature of the site the Public Hall has been placed on the ground floor with its entrance at the back, thus giving ample entrances and exits. This was the only design in the competition which gave this arrangement, all the others putting the Hall on the first floor with the entrance staircase, &c., at the front, as was done at Bermondsey. This position, however, was rendered impracticable by the limit of cost and the requirements of the County Council.

The placing of the Hall as it is necessitated great care and compactness in planning the offices, as the size of the site was none too large. The offices have, therefore, been kept as small as possible, and no room wasted. The drawback to this arrangement is that the large Hall looks, perhaps, a little short inside; and the staircase in the office block leading up to the Vestry Hall appears too cramped, and hardly of sufficient dignity for the vestibule and hall to which it leads.

A peculiarity of the Public Hall is that it is arranged for stage performances, and fulfils all the requirements for the Lord Chamberlain's licence. We believe this feature is unique, at any rate, in Town Halls in London. Its ground floor position is similar to Battersea, and seems to be the best arrangement on the whole for this class of building.

The aim throughout seems to have been to combine compact and straightforward planning with sound construction, and as regards the external appearance, to express the internal arrangement as naturally as possible, so as to obtain a characteristic effect, and to rely on good proportion and well-studied detail.

The exigencies of the case have necessitated some unusual treatments. The gable and chimney of the public-house next door butting into the roof, rendered a ridged roof necessary, instead of a hipped one, which would have been more in character with the front. This tends to make the front look like a strip of a larger building, and involves an awkward junction at the angle between the balustrade of the front and the spring of the return gable.

The usual treatment here would have been to run the balustrade round the side. An attempt has been made to keep the gable in harmony with the more severe style of the front and

at any rate it wastes no room, and adds considerably to the general effect. It is also made some use of as a staircase to the public gallery and caretaker's apartments.

ROTHERHITHE TOWN HALL. MESSRS. MURRAY AND FOSTER, ARCHITECTS.  
VIEW FROM LOWER ROAD.

the building generally. The result can be judged in our illustration.

It is doubtful whether a tower is wanted in a building of this description, but in this case

The foundation stone is of red Peterhead granite, and inscribed as follows:

THIS FOUNDATION STONE  
WAS LAID ON TUESDAY, THE 17TH DAY OF  
SEPTEMBER, A.D. 1895,  
BY EMILY BLANCHE CARR-GOMM,  
THE WIFE OF FRANCIS CULLING CARR-GOMM, ESQ.,  
AND LADY OF THE MANOR OF ROTHERHITHE.

The stone is placed on the left of the entrance in Lower Road, and on the opposite side is another stone, also of red Peterhead granite, bearing the names of the then existing members of the vestry, and the names of the Architects and builder.

We append a full description of the arrangement of the various departments and the materials used in the construction:

The building has a frontage of 52ft. 6in. to Lower Road, a return frontage of 161ft. to Neptune Street, and a frontage of 54ft. to Moodkee Street. The elevations are of Portland stone, and red bricks supplied by Mr. Thomas Lawrence, and the roofs are covered with green Westmoreland slates, the fleche to the roof of Council Chamber being covered with lead and surmounted with a wrought iron weather vane. The sculpture of the two caryatides to the porch in Lower Road is by Mr. Henry Poole, the animals over the porch and those round the top of the building are by Mr. Charles Beacon; the figures and ship to the pediment of the Lower Road front are by Mr. F. Lynn Jenkins; the two pediments in Neptune Street and the remainder of the carving are by Mr. George Hawkings. The main entrance to the Council Chamber and Offices is in Lower Road, with oak doors made in Mr. Howell J. Williams' workshops; they open into a lobby lined with Devonshire marble, and lead through oak swing-doors to a central octagonal Vestibule measuring 22ft. across, from the sides of which the various

VIEW FROM MOODKEE STREET

offices are entered. A private door communicates with the staircase in the Tower, which leads up to the Public Gallery to the Council Chamber, and to the caretaker's apartments.

On the south side of this vestibule is situated the principal staircase, the steps being of

into Neptune Street, and one at the opposite side opening into the yard on the south side, and from thence into Moodkee Street. The basement contains store room, strong room, and heating chamber. On the first floor, at the top of the principal staircase,

ceiling has a large ornamental fibrous plaster cove and a flat ceiling light, glazed with lead lights. On the north side of the vestibule is a small waiting room, which has another entrance from the staircase in the tower, and a door leading into the Coroner's Court. The caretaker's apartments are on the second floor, with access by the staircase in the tower.

The heating is by hot water on the low-pressure system by means of a Gurney boiler.

The ventilators have been supplied by Messrs. Kite and Co.; the speaking tubes by the Homacoustic Tube Company; and the chimney pieces by Messrs. Shuffery and Co.

#### "A TOUR IN HOLLAND."\*

By J. B. MITCHELL WITHERS.

ONE of the advantages of Holland for a short trip is the ease with which one can get there; and get about when there, places of interest lying close together, and the means of conveyance between them being good. I think, as many points apply to each place visited, it will be most convenient first to give a short description of the route taken, then to give a general description of the main features of the towns, and the domestic Architecture, which is the principal feature of this country, and its chief peculiarities and characteristics, and notes on public buildings and special objects in different towns. Leaving Sheffield, we (my friend and I) took the night boat for the Hook of Holland, and went on in the steamer to Rotterdam, where we stayed one day, afterwards taking the train to Delft, and spending the morning there, intending to see the manufacturing of the tiles for which it is celebrated, as well as look round the town. We could not, however, see these manufactured unless we waited until the afternoon, and therefore we proceeded by the steam tram to The Hague, thus getting a good view of the country lying between. While at The Hague we visited Scheveningen, also by steam tram. From The Hague we went forward to Leyden, and Haarlem to Amsterdam. After spending some time in Amsterdam we returned by railway to The Hague, and thence to Harwich.

GROUND FLOOR VESTIBULE.

artificial stone, and the strings, dado, handrail, and balustrade of Devonshire marble, supplied by Mr. H. T. Jenkins. The staircase window is glazed with stained glass in lead lights. The floor of the vestibule is of marble mosaic laid by Messrs. B. Ward and Company, who have also provided the fire-resisting floors and the artificial stone staircases. The Vestry Clerk's offices are on the left of the main entrance, and contain waiting lobby, general office, strong room, and private office. The Surveyor's offices, including waiting lobby, general and private offices, are on the right of the main entrance; the overseer's office, with strong room, is across the vestibule and next Neptune Street; a committee room adjoins the same and also faces Neptune Street. On the south side, opposite the last, are the offices of the medical officer and sanitary inspectors. From the octagonal vestibule, and opposite the main entrance from Lower Road, a corridor leads direct to the platform of the public hall, after passing through double iron doors in the party wall which divides the office block from the public hall.

The entrances to the Public Hall are from Moodkee Street, through a spacious vestibule, on the north side of which a ticket office is placed, and on the south side a door leads to the gentlemen's and ladies' cloak rooms. The platform is arranged for ordinary public hall purposes, and is also constructed in accordance with the requirements of the London County Council, so that it can be used for dramatic performances. It is fitted with an asbestos fireproof curtain, supplied by the United Asbestos Company, with a scene painted thereon by Mr. Bruce Smith. There is a small retiring or dressing-room on each side of the platform, with small flies over, and a gridiron over the whole platform, high up near the roof. There is an exit from each side of the platform—one directly into Neptune Street, and one into the yard on the south side, and from thence into Moodkee Street. The dimensions of the Public Hall are 63ft. long, 53ft. wide, and 36ft. high, with seating accommodation on the floor for 574 persons, and a gallery runs round the two sides and the end with oak benches to accommodate 307 persons.

There are two swing entrance doors to the Public Gallery with access thereto by two artificial stone staircases, entered directly from Moodkee Street; there are two swing entrance doors to the ground floor of the public hall, and three emergency exit doors in addition, two at the side opening directly

is a vestibule paved with marble mosaic, giving access on the west side through two doorways to the Council Chamber, which extends throughout the whole front to Lower Road. This room is 50ft. long, 30ft. wide, and 23ft. high. The ceiling is decorated with ornamental fibrous plaster from the Plastic Decoration Company, who have also supplied the fibrous plaster to the ceilings of the Public Hall and Coroner's Court. The Council Chamber is lighted by three large semicircular headed windows facing Lower Road, and on the opposite side are the two entrance doors.

FIRST FLOOR VESTIBULE.

Above these doors, and extending over the vestibule, is the Public Gallery with access by the staircase in the tower, entered from Neptune Street.

On the east side of the vestibule is the entrance to a spacious cloak room and the Coroner's Court, the latter having oak joinery with an oak dado 3ft. high, and there is a small retiring room for the coroner. The

I cannot begin my description better than by taking the canals, often with streets on both sides, with trees planted along them which in most towns in Holland form striking and picturesque features, and in which one finds new interest at every turn, the reflection on the

\* A lecture delivered to the members of the Sheffield Society of Architects and Surveyors.

water, the colour of the barges and boats forming most effective foregrounds to the old brick and plaster houses on the farther side, the pictures met with on every side being, perhaps, completed by a Church towering gracefully at the farthest point of the canal on a bridge nearer at hand. Holland is charming to an Architect from

#### AN ARTISTIC POINT OF VIEW

rather than a purely Architectural one, for, while its principal buildings have not generally the design nor details or the fine lines that exist in buildings in this country, and also in France and some other foreign countries, still they are suited to their surroundings, and usually common sense, the older ones being quaintly picturesque. In the domestic buildings the doors are often of really good design, and vary very much, the upper panels often being filled with graceful grills of wrought iron; the windows, whether divided into small squares or not, are generally painted white, which harmonises well with their surroundings. Fine gables are not plentiful, many houses being finished with a cornice and parapet in a French style, others with gables with nothing specially worthy of note about them. Many of these, however, I feel sure, were intended, or were perhaps actually surmounted on their flat space by either a lion or some other object by which the house could be identified. This would improve them considerably, and give a reason for the flat termination. As a proof of this you will find them so finished in many old pictures, and occasionally a spike now remains, as if it had been a dowel to secure the object. Here and there, however, there are gables which are most picturesque in outline, and others which are gracefully decorated by masses of ornament carved in stone.

Mooke Street

ROTHERHITHE TOWN HALL.

Each house has, I believe, its own walls, party walls not being used, and the entrance door is usually reached by a few steps, the basement in some cases being used for business purposes.

Occasionally a building occurs with wrought iron straps, which add to its picturesqueness, especially if it looks strong in other ways, as though intended for a warehouse; and here I

white space round it serves the same purpose that a margin does for an engraving or print, the joint between the tiles helping to frame the picture, and bind it to its fellows. How much

ROTHERHITHE TOWN HALL. INTERIOR OF COUNCIL CHAMBER.

must not omit to mention the beam and pulley projecting from many buildings, a few being of iron, to swing, the majority of wood, fixed with the upper side formed like a little roof to protect them from the weather. These pulleys were not only used for lifting goods into the warehouses, but were used in private houses for hoisting peat to be stored in the topmost story behind the steep gables. These steep-pitched roofs are tiled, and a few have fine brick chimneys. Most of the chimneys have a cover over them, the smoke issuing from holes in the upper part of the sides. Many of the houses have painted plaster fronts, and these always look clean and fresh, except in the very poorest part of the towns; whether this is chiefly due to the climate, or whether the occupiers have them painted every year, as I was informed, I cannot say, but they must have considerable care taken to keep them in such good condition. I was much interested in seeing a house front undergoing a thorough cleaning down. The painters had special irons which they placed at the level of the eaves of the building, and from these were hung pulley blocks with ropes, having irons attached, carrying planks suspended from them. These planks served as a scaffold for the men to work from, and which they raised or lowered at pleasure. With this apparatus the men seemed to get their work done very quickly, it only taking two men two days to clean down, paint, and repaint a large house front. Among the chief objects of interest used in internal decoration in Holland are the

#### OLD TILES,

with their quaint designs, which seem to grow more interesting the more one sees of them. These tiles were mostly made in Delft, from the alluvial clay found there. Many were brought over to England at the end of the seventeenth and early in the eighteenth century, and a manufactory exists at the present time at Delft; but the modern tiles are not equal to the old ones. Before seeing the tiles *in situ* I had never realised why so many tiles have a small dot of painting in the centre only, and preferred those with larger pictures on them; but when a wall or a fireplace is seen covered with tiles, those with the small centres being used as filling, and those more largely covered with painting being used for borders or divisions, the effect produced is far more pleasing than if more painting were introduced, and, as in some cases a story is continued from tile to tile in the pictures, the

more interesting this filling is than when plain white tiles were used you will readily understand, and, while the broad mass of white reflects the light, the small portion, coloured by contrast and breaking up the surface, renders the slight variety and defects in the tiles an additional attraction rather than otherwise. Most of the tiles are either blue or purple, on a whitish ground, though some have yellow, orange, or green introduced into them. Occasionally one sees a set of tiles composing one picture; but these, while, very interesting in themselves, and much sought after, are not so characteristic as the tiles complete in themselves. Mantelpieces and other pieces of woodwork in the rooms are often highly artistic and most interesting. In speaking of Dutch woodwork, I saw at a Church in Lincolnshire some years ago a screen with what appeared to me to be a strong Dutch feeling in its panelling, and, as I had never seen anything like it before, I examined it carefully to see how it was marked, and found, owing to some bits not being quite finished, that it was first pierced and sawn out in a similar way to fretwork, so as to give the outline where desired of faces or other forms, and then elaborately carved. The vicar was of opinion that its panelling had been brought from Holland, but I think it more likely that a Dutch workman had executed it on the spot, owing to portions not being quite finished. The old fireplaces have their backs lined with tiles, and fine iron dogs to carry the fuel. The wrought ironwork one sees is usually good. Perhaps the first thing that strikes the visitor to Holland is the flat, low river-banks, with rows of trees at right angles or parallel to them, varied by windmills. These reoccur repeatedly in the Dutch pictures, and if one had not seen them they would appear stiff and unnatural. It is after these rows of trees that the Boompjes at Rotterdam are called. These are the principal quays. The chief objects of interest at Rotterdam are the Boompjes, the Groote and other Markets, the Groote Kirk, and Boyman's Museum, and its chief street, Hoogstraat. Besides these there are many old houses. There are good public gardens and a Zoo.

(To be continued.)

THE new chief offices of the Rational Sick and Burial Association, built in Bridge Street, Deansgate, Manchester, have just been opened. The building, with its site, has cost about £24,000.

## THE ROYAL ACADEMY.

## FIRST NOTICE.

**E**VEN at its best, the Annual Exhibition of drawings in the Architectural Room at the Royal Academy gives but a partial and ineffective rendering of the aims and aspirations current in the Architectural world. Here and there, perhaps, a worthy design is shown with sufficient force and vigour to grip the attention, but many are represented by drawings that, in making a vain attempt to capture the public, only succeed in alienating the Craftsman.

This year's Academy is, more than most, given over to the little; to consider it as an Exhibition really representative of the Architecture of the year would be to assume an almost entire inactivity in the erection of buildings of public importance, by far the larger number of the exhibits consisting of more or less successful designs for small houses and other buildings, tolerable or otherwise, more in proportion to the skill of the draughtsman than to that of the designer of the work represented.

Among the few examples of this year's exhibits that illustrate works of some magnitude, we may draw attention to the large Church of St. George, Stockport, in which Messrs. Austin and Paley maintain the best traditions of the Gothic school, while their design does not lack a certain individuality of conception; the building is adequately represented in the four drawings exhibited (1790, 1885, 1891, and 1892). Mr. Caröe's design for the important Technical School and Museum, Liverpool, is shown by a perspective view (1818), and a detail (1831), the latter noticeable for the freedom with which the ornament is drawn; of his successful design for the same building, Mr. Mountford only shows a small interior of the principal lecture hall.

A large black and white drawing (1841), unfortunately mechanical in its execution, shows a large block of buildings at Liverpool, by Messrs. R. Norman Shaw and J. F. Doyle, which, we venture to think, will hardly add to the high reputation of the first named. Neither is Mr. Ernest George well represented this

year, the one drawing he exhibits (1839) being characterless and uninteresting; while the fascinations of the art of painting in oils have apparently limited Mr. Waterhouse to a single contribution to this room, viz., a perspective view of the new Surveyors' Institute, coloured in his usual manner. Mr. Pearson's unobtrusive pencil drawing (1924) for the Bristol road screen is in his later style, in which softness of outline and intricacy of detail have rather taken the place of the virile expressiveness of former days.

After this preliminary glance round we will proceed to go through the designs *seriatim*, mentioning those that seem to demand more than cursory attention. We find among the earlier numbers a Yorkshire Church (1741), by Mr. Fellowes Prynn, that would probably look well in execution, though scarcely, we should imagine, as satisfactorily as his exceptionally successful Church at Dulwich. Messrs. Brewill and Baily send a good drawing of a pleasant little street corner in the Hedgehog Inn, Nottingham (1742). Mr. Caröe's design for a bishop's throne (1750) is late flamboyant in character, freely treated with considerable elaboration, while the general lines are severe and the proportions not unsatisfactory. Drawing No. 1751 has apparently got adrift from the water-colour room; it is not notable for its Architectural qualities, and for this reason its present position is to be deprecated. No. 1752, a Church at Putney, is an attractive drawing of a design decidedly happy in general proportion and detail, in which a very successful effort has been made to harmonise a wide, low-pitched roof with a spire of considerable height. Adjoining this a large space is occupied by three drawings of the decoration in the Abbey Church, St. Savin, by H. C. Corlette, well worthy of their position. They are studies of some very interesting work, obviously rendered with absolute sincerity both as to form and colour. Mr. Aston Webb's School-house (1759) is rather an unexpected departure—we have not seen this Architect in such a "Georgian" frame of mind before.

The new theatre for Mr. Beerbohm Tree, illustrated in No. 1760, is a design fortunately without parallel in this year's Academy. This pretentious pile of appalling rubbish presents

not a single redeeming feature, and makes the adjacent drawing of the Royal Music Hall seem almost respectable by force of contrast. London is indeed to be commiserated on her acquisitions in this direction. It is humiliating to consider how few are the buildings of this class to which we can point with any degree of pride. The reason for this is difficult to

imagine. Why should not buildings of this semi-public character demand a high degree of Artistic skill?

A recent Church by Mr. James Brooks (1766) hardly receives justice in the drawing, the nave has the quiet breadth of treatment that we should expect from this hand, but the proportions of the squat towers flanking the end are surely open to question; more attractive are the very able Church Designs (1767 and 1787) by Mr. Charles A. Nicholson. Of the first we give a rough note, but both are most happily and artistically handled in full-toned water-colours; indeed, these and the numerous other drawings from Mr. Nicholson's brush are among the most refreshing features of this year's Exhibition. The only criticism to which this design might be considered open is in regard to the position of the buttresses on the east wall; they hardly seem to convey the impression of structural necessity, though they may actually be legitimate enough.

The design for a hillside Church (1772), by C. L. Brierley, is a good study for a small building in harmony with its surroundings; while interesting in grouping and proportion its simplicity and austerity mark it as an outlier at the extremity of civilization. Mr. Briggs' design for a riverside cottage, with its balconies, etc., will probably be of interest to the general public, as a treatment suited to the requirements of the case. Mr. Caröe's Church at Nottingham (1781) is externally somewhat lacking in breadth, the west end, in particular, being restless and "bitty"; the interior, however, gives an impression of more harmony, and the details are of a simple and refined character. A small coloured drawing of the Passmore Edwards Settlement building (1784), by Messrs. Smith and Brewer, shows a square block, in which good proportion in mass and in detail, lends interest to a comparatively simple building. The country house (1789), by Messrs. Silcock and Reay, seems well grouped and placed, but leaves much to be desired in respect to detail, a criticism that may apply with still more force to Mr. Larnier Sugden's house at Rugby; while, on the other hand, Mr. Voysey's design for a house on a Surrey hillside strikes us at

once as one of his most successful efforts, the composition broad and restful, and the plan well adapted to the sharply-sloping site. The drawing is a spirited and crisp water-colour, with the light plaster work laid on in white. Mr. Belcher's design for screen and organ, Kineton Church, Warwickshire (1800), is Jacobean in character, the organ being somewhat more freely treated than the screen; it is well illustrated in a very effective water colour by J. J. Joass, who has also, we may note, drawn Mr. A. B. Pite's work. No. 1801 is a sparkling drawing in black and white of the Romanesque porch of St. Gilles, by C. E. Mallows.

In No. 1808 we have a very good drawing, in cool tones, of a rood-screen decorated in colour; the design shows a solid rood-loft painted white, with a small amount of ornament diapered over it. This forms a background to the figures of the central group, while the cove under is in blue, and the solid panels below an open screen are of a pale red tint, all the colours being so softened as to produce an harmonious result. Even more successful as a drawing is No. 1819, in which the greater play of light and shade through the various planes is taken full advantage of. Mr. A. B. Pite has three drawings of some of his work in the West End (1826, 1827, and 1828), in two of

#### AUSTRALIAN WOOD FOR PAVING.

AN important change is rapidly spreading over the roadways of London and other large towns—the change from soft to hard wood paving. For many years there has been a difference of opinion as to the comparative merits of granite pitchers, so-called macadam, asphalt, and wood paving. The latter was originally the fad of a dentist; and the first essays were all failures. Tradesmen, however, supported the pavement because it was noiseless; and the engineers and surveyors of the Metropolitan parishes have done their best to make it answer for practical purposes. All the earlier wood pavements were laid with Baltic deals and cement joints, these being the materials most readily dealt with. It was in 1839 that the first wood paving worthy of record was laid in the Old Bailey. Many thousands of square yards were subsequently put down, and over thirty patents taken out for modes of performing that operation, until, in 1884, the wood pavings had increased to the extent of fifty-two miles. Since that date the advance has been continuous. But the shrinkage, decay, rapidity of wear, and the insanitary conditions due to the absorption of water and of

#### ORGANIC FOULNESS

by the soft wood have led to troubles and

the road is stated at 699 tons, and 3014 vehicles. The annual

#### WEAR OF THE WOOD

has been under 0.2 inch. This same parish of Lambeth has subsequently used seven millions of blocks. St. Pancras, St. Giles, Southwark, St. George the Martyr, St. Martin's in the Fields, Streatham, Wandsworth, Fulham, and other large London parishes have more or less adopted it for their heavy traffic, with the result that there are now in the metropolis over twenty miles of Jarrahdale Jarrah alone. The same wood is in use in Paris, Berlin, Glasgow, Manchester, Nottingham, and other cities and towns. In the Government Handbook of Western Australia these forest products are put foremost as a source of great wealth to the Colony, and the most valuable woods are stated to be the Jarrah, the Karri, and the Tuart. Jarrah timber is obtainable through more than five degrees of latitude, and the present forest holdings are within easy access to shipping ports. The leading timber stations of the Colony are the "Jarrahdale," with a forest holding of 250,000 acres, connected with the port of Fremantle by a railway; the Karridale Timber Mills, near Cape Leuwin, with 150,000 acres, and satisfying a large demand; the Canning Jarrah Mills, with a railway from Guildford to Fremantle and 100,000 acres of holding; the Torbay Mills, near Albany; the

which the severity of Architectural line and the heavily loaded figures suggest the influence of Michael Angelo, while the other strikes a more modern note, and, though not lacking in dignity, is more in harmony with the simple character of the building to which it forms the entrance. The rough sketch we give of this can but indicate the general scheme. The water-colours exhibited are handled with remarkable vigour.

Mr. Stevenson's block of houses (1825) will probably do the Architect more credit in the actual building; the drawing shown is rather hard and chilly. The college design by Mr. Hare is of a quiet dignity, although somewhat monotonous, but the otherwise very able black and white drawing that illustrates it, possibly contributes somewhat to this impression. No. 1834 can only be noticed as an amazingly feeble drawing of the interesting Shipton House, Shropshire. It is difficult to conceive by what means such work can find its way to the walls of the Academy. And it is such extraordinary errors in judgment that makes one wonder who is the Hanging Committee.

The exigencies of space compel us to postpone our consideration of the important work by Mr. C. W. Whall, Mr. H. Wilson, and others till next week, when we trust to complete this notice of the Architectural room, and to make a hurried excursion round the remainder of the Exhibition.

difficulties which have all been endured for the sake of diminution of noise in the arterial street traffic. In 1887 came the Indian and Colonial Exhibition at South Kensington, and there, in the West Australian Courts, were shown magnificent samples of the eucalyptus hard woods from the great Darling Range, which covers a tract of over 30,000 square miles, the most notable being the Karri and the Jarrah, more particularly the *Eucalyptus marginata*. This wood was then already known for its excellent qualities in shipbuilding and harbour works. It was first used in repairing his Majesty's ship Success, in 1829. It was also esteemed in railway work, as one of the most marked qualities was freedom from wet or dry rot. It was on the occasion of the Exhibition referred to that it was introduced into the English market for wood paving. The advantages of a hard, almost non-absorbent fibrous material for this purpose were singularly striking, and in the following year a section of the Walworth Road was laid. In 1889 the Jarrah, now known in the trade as "Jarrahdale" Jarrah, was put down in the Westminster Bridge Road, noted for its incessant and exceedingly heavy traffic. That paving is still in good condition, although the traffic over it towards Westminster is reckoned at 1002 tons per yard of width of roadway from 6.0 a.m. to 6 p.m. during which time 3574 vehicles pass. The traffic on the other side of

Quindalup Mills, near Geographe Bay; and the Bunbury Mills. The forests from which timber is now exported from Western Australia are all together at its south-western extremity, doubtless through the climate being subject to moist currents of air from both south and north. The best Jarrah wood is found in the hill ranges, and not nearer than 15 or 20 miles from the coast. The areas occupied by the principal species of West Australian eucalyptus are white gum (*E. redunca*), 10,000 square miles; Jarrah (*E. marginata*), 14,000; Karri (*E. diversicolor*), 2300; Tuart (*E. gomphocephala*), 500; red gum (*E. calophylla*), 800; and York gum (*E. loxophleba*), 2400 square miles.

#### THE WHITE GUM

grows in profusion east of the Darling Range, but this wood does not seem to be as yet an article of export. The Tuart timber is extremely hard, twisted and gnarled; it is the strongest wood known. West Australia has been the first to furnish Europe with hard woods for paving, and still holds its own in the markets of England, France, and America. The hard woods of other countries have failed, so far, to get a footing, although the natural desire of public bodies to try cheaper materials is inducing purchasers of small parcels. The Scientific and Practical Research Department of the Imperial Institute some time ago invited inspection of a number of Queens-

land woods—crows ash, iron bark, spotted gum, blood wood, blue gum, black butt, and tallow wood; but nothing much has come of the effort. The French have tried to introduce the cultivation of eucalyptus into Algeria and some other of their colonies. Hard woods from Africa, from New Caledonia, Syria, Borneo, and other forest territories have been brought out from time to time, but have as erratically disappeared. Of the care taken with the "Jarrahdale" timber a forcible account has been given by M. Pêche, for many years the Engineer-in-Chief of the Municipality of Paris. The most beautiful trees are found on the most elevated places. The trunks, absolutely straight, attain a height of thirty to fifty metres, with a diameter of five metres. The first branches do not appear under ten or fifteen metres, and plain timbers of twelve to fifteen metres long and 2ft. square can be obtained. The trees are cut out of the rainy season, and when the sap has descended and formed a last ring. Four or five weeks

#### BEFORE FELLING

the tree is surrounded with a cutting to prevent the movement of the sap. The evaporation then continues by the leaves, and thus is eliminated a litre and a half of water per cubic foot. When the leaves are withered the tree is felled and transported to the saw-mills. There the planks are piled in the sheds and covered with sawdust until they are sufficiently dry. The Karri is a still more colossal tree, and sometimes reaches 130 metres in height. Trunks have been measured to ninety metres before branches begin. The use of these two hard woods constantly increases in London; but its extended introduction has to face the strongest opposition from the old Baltic trade interests.

#### THE OLD BAILEY.

THE Finance Committee of the Corporation has recently considered the question of finance in connection with the proposed rebuilding of the Sessions House in the Old Bailey. It states in its report that it had obtained from the surveyor an approximate estimate of the probable cost of carrying out the sketch plans for the new Courts, and it had instructed the officers to report as to the several sources from which the requisite funds might be obtained. The cost of the proposed rebuilding and complete equipment of the Sessions House, with its various Courts and offices, was estimated at £120,000. It was also proposed to utilise the female wing at Newgate, the freehold of the Corporation, of an estimated value of £21,750. The land on which the existing Sessions House and Courts stand, with the adjacent yard, is estimated to be of the value of about £50,000, and is also the freehold of the Corporation. The utilisation of the suitors' fund of the City of London Court, now amounting to £70,585, was a suggestion which received due attention; but, although, no doubt, under certain conditions the Corporation, if it were deemed advisable, could thus utilise the fund, the committee did not in all the circumstances advise the adoption of such a course in this instance. In its judgment the present state of its finances would not justify the sinking by the Corporation of such a sum as £70,585, or anything like that sum, in connection with an undertaking which must necessarily be

#### ABSOLUTELY UNREMUNERATIVE.

Further than that, it did not consider that the present state of its finances would justify the Corporation in parting with the female wing of Newgate for that purpose unless some adequate pecuniary benefit could be made to accrue to the Corporation thereby. It must not be forgotten that in 1902 the grain duty, now producing on an average £18,000 per annum, would come to an end, when the open spaces belonging to the Corporation would have to be wholly maintained out of the City's cash in the absence of Parliamentary assistance, and the Corporation would be left to discharge the outstanding loan raised upon the credit of the grain duty, now amounting to £194,000. The trial of prisoners at the

Central Criminal Court was not restricted to persons committed from the City and County of London, but included prisoners from Middlesex, Essex, and Surrey, and it might not be unreasonable to approach those various counties, and suggest the desirability of a contribution being made by each towards the cost of the proposed rebuilding, such contributions to be based upon the proportions in which the respective counties are liable to contribute towards the salaries of the officers of the Court—viz., London (including the City), 35-40ths; Middlesex, 2-40ths; Essex, 2-40ths; and Surrey, 1-40th. It could not be urged against the Corporation that in making such a suggestion it was not acting reasonably in the matter, inasmuch as it must be carefully borne in mind that the whole of the new buildings would stand on freehold property of the Corporation, from which no income would be derived, and that the Corporation, in addition to paying out of the City's cash the salaries of the Recorder and Common Serjeant, would also continue to bear the other expenses in connection with the maintenance of the Courts and buildings, including supervision and repair. The Central Criminal Court holds almost continuous sittings, far more than any other Court of Assize, and prisoners are always sent for trial there from the counties enumerated in far greater proportions than those committed from the City itself. In cases of offences on the high seas and other places within the jurisdiction of the Admiralty of England, the prisoners must be tried at the Central Criminal Court. For these reasons the Finance Committee recommends that the whole cost of the proposed rebuilding of the Sessions House and Courts, including the additional land required for the purpose, and the premises to be used during rebuilding, be defrayed by means of a county rate restricted to the City area. The report will be considered at a future meeting of the Corporation.

#### TILES.

BY W. NORMAN BROWN.

TILES, and the Art of tiling, may be said to be the connecting link between the fine and the useful Arts, the combination being both artistic and useful. The glazed tiles which are employed for decorative purposes are of four kinds, viz.: Art, enamelled, embossed majolica, and encaustic tiles. The first-named are hand-painted, and are used in the decorating of grate backs, pilasters, and in cabinet work; the second description are also used in this work, as well as for flower stands, wall linings, and in Architectural decorations; the third sort are employed in much the same manner; and encaustic, plain, and mosaic tiles are utilised for pavements and such like uses. Inlaid encaustic tiles of an extra thickness are employed for hearths, and self-coloured glazed tiles of white celadon, turquoise, olive, and buff, in squares and in geometrical designs, are used for wall linings. The encaustic tiles now commonly made of an earthenware intermediate between the common tiles and porcelain, are very largely used in the paving of churches, halls, baths, conservatories, and similar places. They differ from those of ancient days in the way in which they are finished, as the Artists of those days employed the stylus and wax, whence the name was derived from the Greek *en*, and *kaustikos*, burning. The exact method of burning in the design has not been acquired by the modern tilemaker, who employs oil in lieu of the wax of the ancients. The manufacture of the celebrated Minton decorative tiles is carried out thusly: The clay is first put through a variety of washings and purifications, and then passed through fine lawn sieves in a liquid state. It is then boiled until it is in a plastic condition. The pattern is cast in plaster, and placed in a metal frame of the required size. A piece of the clay is then rolled out like pie-crust, and pressed upon the plaster pattern to receive the correct outline of the design. The metal frame containing the plaster mould is divided hori-

zontally and the surface put in, the frame put together again, and filled up with coarser clay of the required thickness. The tile is then put under a screw-press to receive the proper degree of solidity. The durability of these tiles is such, both in regard of the strength of the material and the intensity of the colour, that nothing short of absolute annihilation affects them. The oldest specimen of glazed tiles in England was discovered in a ruined Friory Church in Norfolk, a portion of which is to be seen in the British Museum. These tiles are ornamented with escutcheons of arms, and on each is the name of Thomas. In ancient Pompeii scarcely a house seems to have been devoid of its mosaic pavement, and in old Greece inlaid pavements of various coloured marbles were employed for the sumptuous decorations of the time of Alexander of Macedon. They were in fretwork and geometrical patterns, but the most famous is the one mentioned by Pliny as the masterpiece of one Sosos of Pergamos, called the "Unswept Hall." It is inlaid so as to represent the crumbs and fragments which would be found on a floor after a banquet, with the doves which had flocked in to partake of the feast. Another masterpiece of the tiler's art was the floor of the great ship *Hieron II.*, which was of small cubes of stone of every colour, representing the history of the siege of Troy; a work which occupied 300 workmen a year. Mention is made of a tiled court in sacred history as early as 521 B.C. It is described as a pavement of red, and blue, and white and black marble. This was the garden court of the Palace of Ahasuerus, and the art of enamelling in glazed colours was well known to the artisans of that locality at that time. Blue was a favourite colour, combined with black marble. The Dutch tiles are famous the world over. Washington Irving, in "The Alhambra," gives the history and origin of these tiles, which have figured so largely in the useful Arts. He says they were brought into Spain by the Moors, and were used by them in the building of their Spanish palaces. From this country they were introduced into the Spanish Netherlands by the Dutch soldiers, and from there into Holland. The polished surfaces of the tiles commended them to the Dutch housekeepers, who have always been famous for cleanliness. They took such hold upon the people that manufactories were set up, and the numbers turned out rendered the cost within the limits of householders in general. The polished surface of tiles and the durable nature of the material still commend their use strongly for the maintenance of extreme cleanliness. From a sanitary point of view, tiled floors for apartments commend themselves. From an Artistic point of view, tiles present the most captivating forms of beauty. The highest Artistic talent is employed in the conception and execution of the designs with which they are decorated. Even giving the colours to tiles is an operation requiring great skill and care. It requires three days, and the tiles are then dried from two to three weeks, and then fired, where they are exposed to an intense heat for sixty hours.

THE Hampstead Vestry has decided to ask the Local Government Board for leave to borrow £2000 for the erection of the Belsize Branch Public Library.

At the National Liberal Club the present system of lighting is to be thoroughly overhauled, and the sum of £2000 is to be expended in obtaining additional electrical power.

THE Bridgwater Trustees have decided to construct a tunnel, a quarter of a mile long, from Sandhole Pits to the Wardley Colliery shaft, near Wardley Hall, for ventilating purposes. Their intention is to do away with the furnace which has hitherto been used at Sandhole.

THE Local Government Board having sanctioned the purchase of a site at Nine Elms on which to erect additional baths and washhouses for Battersea, the vestry has approved the estimate of £25,000 for the erection of the necessary buildings, and resolved to invite designs for the same, with a premium of £100 for that first selected.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

May 5th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A PETITION has been deposited at the House of Commons for leave to bring in a bill during the present session authorising the extension of the Victoria Embankment as far as Lambeth Bridge, and various extensive improvements in the parishes of St. Margaret and St. John, Westminster. The proposed improvements will involve the clearance of an area twenty-seven acres in extent, and the cost of the acquisition and clearance of the site is estimated at upwards of £1,000,000 sterling. The proposals include the formation of a wide approach or avenue from Horseferry Road to the Victoria Tower, forming a connection with the approaches to the new Lambeth Bridge; the widening of a street so as to make a connection between Great Smith Street and Horseferry Road, and a street opening out the Church of St. John, Westminster; the formation of a square of the size of Hanover Square, in front of the Church-house buildings, Great Smith Street; and the removal of the whole of the insanitary area and slums of Westminster, and the construction upon the site of large buildings more or less of a public character.

AN early start is to be made with the preliminary work associated with the construction of the new theatre in the Charing Cross Road for Mr. Charles Wyndham. It is estimated to hold an audience of 1500 people, and will be a little smaller than the Garrick. The floor will have about twelve rows of stalls in front of the pit, above which will be the dress circle, family circle, and amphitheatre in three separate tiers. The plans provide for a spacious stage, and comfortable accommodation for the company. The interior decorations and upholstery have not yet been decided upon, though the intention is to have all internal appointments as sumptuous as good taste will allow. The building will occupy a frontage of 80ft. to Charing Cross Road, with a depth of about 100ft., and will be situated between the Garrick Theatre and Cranbourne Street, on the block around which St. Martin's Court passes on three sides. The court will be widened on both sides of the theatre, the north side being chiefly reserved for extra exits and the amphitheatre entrance, the south side affording entry to the stalls and family circle. The façade will be of solid stone, and partly of classic Greek Architecture. The front angles will be curved off and support two towers. The north angle will give entrance to a spacious crush room, and the south direct to the dress circle. Mr. Sprague, of Arundel Street, is the Architect.

A CURIOSITY, in the way of a sealed room, has been discovered in Gainsborough. The existence of this room has been unsuspected, and it was only found during recent extensive alterations. It is about eight or nine feet square, and when the workmen dropped into it from the roof, was found to have no other door nor window, but the floor was strewn with oak panelling, which had evidently been torn from the walls many years ago. One end of the room is roughly bricked up to the ceiling, and the supposition is that the room was per-

haps twice its present length, with the existing stone fireplace in the centre of the north wall, having a door at one side and a window on the west, looking out upon the river. To build cottages, half the room space was taken away, and the consequence was, the sealed aperture. Mr. Forrest, the owner of the property, has had the oak panelling, some of which was found in other parts of the building, replaced, so far as possible, and the result is an excellent reproduction of the old style of panelled room, such as is found in perfection at Haddon Hall, and other historic edifices.

PROFESSOR HERKOMER, in whom love of Art and practical ways are felicitously combined, and who has conceived the possibility of Wales developing into a centre of Art, says:—"I am going to give Wales something I once intended to keep for myself at Bushey. I had intended to establish a great Art and Handicraft School there, but that idea I have abandoned, and intend to give the whole thing to Wales. I hope to live to see the day when artistic works labelled 'Made in Wales' will find a ready sale and appreciation throughout the kingdom." Be that day hastened, for it is a reproach to the Welsh that they have not in sufficient evidence Arts or handicrafts to enable them to put in the hands of admiring tourists of other races than theirs things of beauty which would be a joy of recollection for ever.

A TEMPLE of Rameses III., king of the twentieth dynasty, has been discovered at Luxor. It contains a statue of that monarch, which, however, had been shattered, presumably at the commencement of the Christian era; but the pieces have been put together and restored. An avenue of sphinxes has also been unearthed, as well as an immense courtyard containing a granite stele covered with inscriptions dating from 900 B.C.

HER MAJESTY'S THEATRE, which has been rising during the past year at the corner of Charles Street and the Haymarket, is now completed and opened. Its site is almost identical with that of the old Opera-house, also called "Her Majesty's," where the London public crowded to hear Handel's operas, and which was only finally demolished in 1893. London is not rich in theatres of any Architectural pretensions. Many have only a small frontage on the street, giving little promise of the decorative magnificence within. The new theatre, designed by Mr. C. J. Phipps, certainly does much to supply this deficiency. It is built of Portland stone and red granite, in the style of the French Renaissance—a style perhaps more suitable for the home of modern drama than the severe classicism of the famous houses of a past generation. An ornamental façade, with a loggia distinguished by four Corinthian columns, and surmounted by a cupola, overlooks the Haymarket, while an imposing frontage of 160ft. runs along Charles Street. Structurally, one of its most noticeable features is that there are only two tiers of seats above the floor instead of three. So far as can be judged at present the arrangement seems admirably adapted to give the audience the best possible view. There is hardly a place in the house from which the entire stage is not visible. The disposition of seats intended to hold between 1600 and 1700 people is on popular lines. The style of decoration is described as "Louis XIV.-XV.," and is carried out with taste. The prevailing colours are red and gold, the proscenium, columns, and pilasters being worked in marble with ormolu mountings. The proscenium curtain and the whole of the carpets were supplied by S. J. Waring & Sons, Ltd., who also carried out the whole of the upholstery in the stalls, boxes, and dress circle. There is an elaborate system of warming and ventilation with fans worked by electric motors. The theatre is fitted with reproductions of the Fontainebleau candle brackets, electric light being substituted for candlewicks. The dressing-rooms have exceptional advantages in the way of light and air.

The decision of the Government to purchase Hertford House as a gallery for the Wallace

Collection is not, we believe, in consonance with the feelings of the authorities at the National Gallery; but it received very strong support in quarters which had influence in the decision. Several cogent reasons may be adduced in its favour. First, the collection can be opened to the public very shortly, instead of being delayed for the interminable time which the building of a new gallery would entail; second, the site is an admirable one, so far as the safety of the collection is concerned, the building being isolated on every side; thirdly, the purchase has probably not been an expensive one, as the neighbourhood is not fashionable; lastly, it supplies a district of London, and that an Artistic one, with a museum, which it does not at present possess.

THE Salon is held for the last time this year in the Champs-Élysées. The Palais de l'Industrie, built for the first International Exhibition of 1856, and used ever since for the annual academy exhibitions, is to be pulled down to make room for the 1900 Exhibition buildings. Already the workmen are beginning to pull down a wing of the Palais de l'Industrie. The consequence is that the central hall is now at one end of the Salon, which spreads over disused portions of the building. The geography of the place is consequently unfamiliar, and the good pictures turn up in the most unexpected rooms. Some of the portraits are of first-rate excellence.

THE Chilean Government has erected several lighthouses on the coast, the most important of which is on the Evangelistas Rocks, twenty-four miles from Cape Pillar, the western entrance to the Straits of Magellan. Mr. G. H. Sleight has held the position of lighthouse constructor to the Chilean Government for a number of years. The Evangelistas light was first exhibited on September 17th, 1896, and had been about two years and a half in course of construction. All the materials had to be transported a distance of eleven miles by a steamer specially purchased by the Chilean Government for this purpose. The erection was a work of great danger and difficulty. After the completion of the work, Mr. Sleight will continue the work of erecting other lighthouses on the Chilean coast, as contemplated by the Government, as the erection of the light house on the Evangelistas Rocks is a great boon to those navigating the Straits of Magellan.

As previously stated, an Art show of very definite importance is to be one of the chief features of the forthcoming Victorian Era Exhibition at Earl's Court. The large building known as the Queen's Hall has been adapted for the exhibition of a collection of pictures, water-colour drawings, and examples of sculpture, which is extensive enough to represent with some adequacy the Art production of the whole of the Queen's reign. More than 1500 works are being hung in the gallery, and among them will be found a great number of notable things. Several very fine drawings by David Cox, a great picture by Turner which has hitherto not been exhibited, Wilkie's portrait of the Queen in her Coronation robes, a characteristic canvas by Sir John Millais, to quote at random, are among the works by which deceased Artists will be represented, and a great deal that is excellent by living men will be either lent by the owners of the works or contributed by the Artists themselves.

WITH reference to the reported railway concessions in China, the natives are seriously considering the idea of making all their own plant for the Hankow-Pekin line at the Hankow ironworks, on which they have spent fully a million sterling, probably more, with no results so far. It is doubtful, however, if a tenth of what will be wanted can be turned out at Hankow, and certainly the material can be bought much cheaper abroad. China is just now full of representatives of syndicates, all anxious to lend money, furnish supplies, and of anything they can in exchange for a contract; but so far there is good reason to say that nothing has been done in this respect. The probability is that no big contracts will

be given away at one stroke, but tenders may be invited for rails, sleepers, locomotives, &c., each separately, and those which suit the Chinese best will be accepted independently.

THERE is this spring, says the *Globe*, even more than the usual amount of lamentation over the way in which the Hanging Committee of the Royal Academy has carried out its work; and certainly, if the list of Artists whose most important works have been "crowded out" is to be taken as a guide, there would seem to be ample cause for a very large amount of outcry. Rarely have so many men of note had their pictures returned to them; and not only the veterans, whose waning powers might justify a hint of retirement, have been slaughtered, but even the younger workers, in the full enjoyment of their capacities, have found themselves set aside. The fact is that the annual exhibitions at the Academy have become such unwieldy affairs that there is no chance of justice being done, either in the selection or the hanging, to the men whose work is original enough to be interesting, and at the same time sufficiently unusual to impose upon the hangers a certain degree of perplexity. Something will have to be done to meet this difficulty, and the sooner it is done the better for the Academy itself, and for the great body of outside Artists. It is not enough to limit the number of works which outsiders may send in. What is needed as well is that a definite reduction in the amount of pictures hung in the galleries should be made. The implied discredit of being "crowded out" would lose all its force if it were generally known that only a comparatively small selection of very exceptional works would be placed at Burlington House; and if the demands upon the wall space there were diminished, the hangers would be able to avoid excluding pictures simply because size or shape made the fitting of a particular frame into the puzzle a matter of difficulty. With more room at their disposal they could place to advantage many a piece of painting which has now to go back to the Artist, simply because in the present close juxtaposition it quarrels with what is hung around about it.

THE Local Government Board has sanctioned a loan of £27,500, for forty years, to the Hornsey District Council for the purpose of erecting 108 dwellings for the working classes and the purchase of  $4\frac{1}{2}$  acres of freehold land for the site. Six-roomed houses are to be built, for which 7s. 6d. a week will be charged, and the dimensions of the rooms will be as great as many of the £40 a year houses in the district, while the gardens will have an average depth of 45ft., equal to most of the Council's allotments. Some of the residences will contain one room less, the difference being marked by a diminution of 1s. a week in the rent, which is inclusive of everything save the cost of light and heat.

A FEW interesting objects of Art came under the hammer the other day at Messrs. Christie, Manson, and Wood's, among which were the following:—A pair of bronze figures of a lion and lioness, by Barye, signed—28 guineas; a pair of Worcester-pattern vases, with exotic birds in frames on a blue scale ground, 8in. high—33 guineas; an ivory cup, carved in high relief, by Grel, of Munich, 12 $\frac{1}{2}$ in. high—23 guineas; an equestrian bronze of an Arab horseman, 25in. high—24 guineas; a clock by Mathieu le Jeune, in case of Louis XVI. design, shaped as a lyre, 25in. high—32 guineas; an oblong wrought-iron casket, of the time of Louis XV., from Hamilton Palace—19 guineas; an oblong plaque, of pear-wood, boldly carved in the highest relief with a basket of flowers in the centre, in the style of Grinling Gibbons, 4ft. by 6ft.—45 guineas; a white marble mantelpiece, designed by Adams, decorated in the centre by an oblong relief of Diana and hounds, fluted columns at the side, the whole slightly inlaid with veined green marble, 74in. wide by 62in. high—80 guineas (this mantelpiece is from Corney Park, St. Alban's); an old Brussels tapestry panel, representing Cyrus and numerous other figures, signed "E. D. E. P." 9ft. by 14ft. 10in.—55 guineas; another

panel *en suite*—46 guineas; a panel of old Brussels tapestry representing a garden scene with Apollo and other figures, and three other panels *en suite*—235 guineas; and a stuffed figure of a brown bear, with the inscription on the stand, "Killed, Feb., 1857, by the Emperor Alexander 2nd., and given to the Duke D'Osuna"—15 guineas.

THE tunnels of the new electric railway from Waterloo to the City have now been practically completed, and the terminus as well as the booking-hall under Waterloo Station have been erected. The electrical engineers are now engaged upon their part of the undertaking. This great engineering work was commenced in June, 1894, when from a pier erected near Blackfriars Bridge the engineers started to drive two shields, one in the direction of Waterloo, and the other in a northern direction. In the following year two other shields were put into operation, each weighing between 16 and 17 tons, and piercing through the ground at the rate of 8ft. a day. The depth at which the excavation was carried out is about 24ft. below the bed of the river, and it is estimated that in consequence of this excavation over 200,000 tons of earth were taken away. The earth thus obtained has fulfilled a very useful purpose. It was carried down to Dagenham Dock, and thence taken to fill up some of the low sections of land in that part of Essex. The work in connection with these tunnels was delayed in the month of April, 1895, owing to a dispute between the engineers of the District Railway and the engineers of the new railway as to whether the new work at a particular point near the District Railway should not be done in compressed air. When that difficulty disappeared the work was carried on with great vigour and speed. The advantages of this new line cannot be exaggerated as far as a large number of the population of this City are concerned. It is stated that over 300,000 persons pass daily between the Bank and Waterloo Station, many of whom are often inconvenienced by the present slow mode of transit between the two points. This new line will obviate such inconveniences in the future by affording better and speedier facilities for compassing short journeys within the radius through which it crosses. The other great railway undertaking, "The Central London Railway," is also making great progress. At the present time the rate at which the tunnels are being constructed is 16ft. per day, but in spite of this rapid rate it will take two more years to complete the tunnel.

FOR a great number of years the growth of St. Albans has suffered seriously from the scarcity of building land suitable for the erection of good residences. The Earl of Verulam, who owns land on almost every part of the city, to meet this want has consented to open up 500 acres of land of high elevation, and with a southern aspect extending from the St. Albans Midland Railway Station to London Colney. The Bath and West of England Show last year was held on a portion of this site, and the Prince of Wales, when visiting the show, expressed his delight with the lovely views obtained of the Cathedral and surrounding country. In order to facilitate building, the freehold sites can be purchased right out or taken on lease for 99 years, or purchased on building society principles, the payments being extended over a term of years.

WHO broke the piece of statuary at the New Gallery? In the midst of the private view there was a sudden crash in the hall. Everybody looked at everybody else; but the gentleman or lady whose arm had accidentally toppled the bust over from its pedestal immediately melted in the throng, and was evidently far too modest to come forward and claim fame as an iconoclast. But as the gallery does not bear the loss, perhaps the culprit may yet send in as conscience-money the modest sum at which the broken bust was valued in the catalogue.

THE first portions of the famous wrought-iron gates which have been removed from Chiswick House were re-erected in front of

Devonshire House, in Piccadilly, last week. These gates, it may not be generally remembered, were originally the property of Lord Heathfield, and stood at the entrance of his house at Turnham Green. This property was broken up in the year 1837, and the then Duke of Devonshire secured the gates for Chiswick House. They took the place of a much older gate, which was re-erected in the fine old grounds at the bottom of Duke's Avenue, and which bears the following inscriptions:—"Builded by Inigo Jones, at Chelsea, M.D.C.XXI." and "Given by Sir Hans Sloane, Baronet, to the Earl of Burlington, M.D.C.C.XXXVII."

THE Vicar of Beverley writes:—"You were good enough to publish the report of a meeting held at the Guildhall, Beverley, on January 26th last, at which the project for filling with statues the many vacant niches in the west front and towers of Beverley Minster was floated, and an influential committee appointed to carry it out. The enterprise has been most warmly taken up, and nearly forty figures have been promised of kings, bishops, abbots, warriors, and saints, prominence being given to those who have been connected with Beverley and its ancient Minster. All classes in the town have shown interest in the work, which has been stimulated by observing the great ability of the sculptor, Mr. R. Smith, who has already completed six of the figures. The women of Beverley are contributing the statue of the Queen, the work being intended as the local memorial of the sixtieth year of Her Majesty's reign; and the pasture masters and freemen those of Archbishops Wickwane and Neville, the donors of the two principal public pastures, which after the great Churches form the most striking feature of the picturesque old borough. But there must be hundreds in this great county and elsewhere, one would think, who are proud of the beautiful Minster of the East Riding, and who would be willing to aid in making it yet more beautiful. Without their help this restoration cannot be carried out in its completeness. We are anxious at once to receive promises of fourteen figures which are needed to complete the row between the two lowest ranges of tower windows, costing £12 each. Then will follow the twenty-three figures in the west portal, and nineteen in the north porch. I should be very happy to forward on application a full outline of the scheme, with lists of subjects (eminent persons not later than 1400, the approximate date of the building of the west front, and fine steel engraving of which heads the circular)."

THE museum of historical relics which is being arranged in the private apartments at Windsor Castle by Mr. Leonard Collmann, the inspector of the Palace, is to be ready for the Commemoration. It will be inspected by the Queen on her return from Balmoral, and will be not the least interesting of the features that will mark the Jubilee, of which it will become a permanent memorial. While embracing the whole life-history of the Castle, the museum will naturally comprise, in the main, objects illustrative of the present reign. These include documents, seals, medals, weapons, relics having personal associations, and a large number of antiquities which, while not being objects of Art, and therefore unsuited for display in the decorative cabinets of the drawing-rooms and the corridor, are of genuine importance to the Archaeologist and the student of the personal history of the English Court.

IT is now quite certain that the London County Council will be the only opponent to the proposed deep-level railway from Earl's Court to the Mansion House which will be considered by Mr. Woodall's Select Committee of the House of Commons on the 14th inst. The petition upon which the Council will oppose the scheme takes the form of a general opposition to the clauses of the Bill, but not to the preamble. With reference to the clauses, the Council ask Parliament to prohibit the District Railway Company from using steam at any time on the proposed railway unless the

railway is designed in some other way than that now proposed. No adequate provision is, they state, made to minimise the annoyance which will be caused by the carting of soil and material through the streets, and they submit that provisions should be inserted prohibiting its removal except during certain prescribed hours when least obstruction will be caused. As owners of the gardens on the Thames Embankment, they object to the powers sought to construct a station under the existing Charing Cross Station, and to interfering with any part of the gardens for that purpose.

It is a long time since the Old Water Colour Society has been able to get together an exhibition of such all-round excellence as distinguishes the one which is now to be seen at the gallery in Pall Mall East. Despite the absence of such valuable contributors as Sir Edward Burne-Jones, Mr. Abbey, and Mr. Alma-Tadema, the effect of the show is most encouraging, and gives promise of the speedy arrival of that improved condition of affairs which is desired by the great majority of the members. One of the most interesting characteristics of the present show is its variety. Among the drawings of figure subjects Sir John Gilbert's "Standard Bearer" is wonderful as an instance of the vitality of a veteran in whom age has diminished nothing of his acuteness of vision and has left almost untouched his ability to put down without hesitation the facts that appeal to him as worthy of record. Mr. Macbeth's "The Gipsy's Sunday," a sturdy Romany maiden bathing in a stream, is a water colour version of a picture which he recently exhibited in the Academy; it is large in style and handled with much of his old freedom. Mr. J. R. Weguelin's graceful mermaids are, as usual, drawn with infinite charm of line; and Mr. Walter Crane's "Dawn" and "West Wind" are what he has accustomed us to expect. Professor Herkomer sends two small portraits only, of Mr. Watts and Mr. Basil Bradley; minute though they are, they show throughout the hand of a master.

For some time past the Board of Trustees for Manufactures has been engaged in maturing a scheme for the decoration of the National Portrait Gallery, Edinburgh. As formerly mentioned, several additional statues for the niches in the façade were commissioned, and those of Dunbar, David Hume, and James Watt are now in the hands of the sculptors. The Architect, Dr. Rowand Anderson, has been occupied in arranging for the ornamentation of the capitals of the pillars in the central hall, some of them after designs of selected pupils in the School of Applied Art, and these are now being proceeded with. The lighting of the hall having been found somewhat defective, a wall which separated three small rooms in front of the building from the ambulatory is in course of being taken down and open archways substituted. For the mural decoration of the central hall and ambulatory with this addition, the Board has decided upon a scheme illustrative of Scottish history, the commission for which has been entrusted to Mr. William Hole, R.S.A., the fee to be paid him for the work being 3000 guineas, on the understanding that the work shall, if possible, be completed under the superintendence of the Board in the course of three years from this time, Mr. Hole being entitled to employ such competent assistants as he may find necessary to ensure the work being carried on with efficiency and dispatch. Mr. Hole has executed a remarkable series of paintings of this class in St. James' Episcopal Church, Inverleith Row.

In his introduction to Mr. Cecil Brown's new work upon "The Horse in Art and Nature," Mr. Onslow Ford, R.A., testifies to the artistic value of the book, which he believes will prove of real service to Artists, whether in their work or in teaching. The study of the horse from life is, as Mr. Ford says, a perplexing subject, and it has been one which has been the earnest and diligent study of all Artists, from the unknown

sculptors who modelled the galloping steeds of the chariots of Rameses and Assur-bani-pal centuries before Christ down to Rosa Bonheur and Alphonse de Neuville of our own day. Mr. Cecil Brown's object is to supply the want of a simple and progressive method for the study of the horse from life, which, without being too technical, shall be accurate. As specimens of Mr. Cecil Brown's power of describing the horse in Art we will quote what he has to say about the famous horses of the Parthenon frieze:—"The Frieze of the Parthenon, from which we derive almost all our information concerning the horse of the Greeks, gives us a very high type, although most probably the animal itself did not approach the sculptures in perfection of form. If we look at this frieze from the same point of view as that from which we see the Greek idea of the human figure, we cannot help being impressed with the fact that the horses here represented are not exact reproductions of the actual animal, but an abstract idea of what the sculptor thought it ought to be in order to fit into his system of decoration. In these reliefs the action of the horses is always that of restraint, in direct opposition to the usual habit of the Egyptian and Assyrian sculptors. This no doubt was due to the advance in Decorative Art, or rather, perhaps, to the change from descriptive to decorative sculpture. One cannot help feeling that the sculptor took much more interest in the moving than in the standing horses, as the latter are comparatively uninteresting. The action, although in some cases exaggerated, is very expressive, the fretting against a heavy bit being shown by the open mouth and the jaw pressed back almost to the neck. The shape of the neck is rather remarkable, being evidently devoid of natural arch, as shown by the standing horses, which are distinctly ew-necked. The position of the legs in many cases suggests the action of what is technically termed 'changing legs,' which means that the horse which has been cantering with the off foreleg leading, changes step and leads with the near leg instead, or vice versa. Evidently the Greeks were up to the trick of 'provoking the caper which they seemed to chide.'"

A "FLOATING CHURCH" has just been inaugurated in the fen country. The parish of Holme, in the diocese of Ely, has, in consequence of the drainage of the fens, especially the famous Whittlesea Mere, so extended itself that about half the population are practically out of reach of their parish Church. To assist him in getting at these outside parishioners, the vicar is trying the experiment of using a kind of house-boat, which can be moved from point to point on the large fen dyke or canalised river surrounding three-fourths of the parish. The craft in question, fitted up as a Church, with a small American organ, portable pulpit, and lectern, has accommodation for a congregation of about forty, and in fine weather, all the windows to the leeward being thrown open, additional worshippers can participate in the service from the dyke bank.

PROFESSOR ARNOLD KROG, a distinguished Dane, and Art Director of the Royal Copenhagen Porcelain Works, has arrived in London for the purpose of studying our ceramic manufactures. Professor Krog is one of the finest flower and animal painters now living. He has invented a new ceramic decorator which is said to rival, and even to eclipse, the finest specimens of Japanese Art. The treatment is the same, but the colouring is more delicate. In a few days an exhibition of Herr Krog's artistic vases and plates will be held in the Danish Galleries, Regent Street. Before leaving Denmark Professor Krog had a lengthy interview with the Princess of Wales, who takes the deepest interest in the progress of Danish Art.

A CORRESPONDENT writes:—"It is generally understood that the Commissioners of Sewers are the sanitary authority of the City of London, and have similar powers to those of the metropolitan vestries as to drainage and

sanitary matters. The vestries—as I know from intimate knowledge—are, if anything, too vigilant in the detection of bad drains and water-closet accommodation; but the City authorities are obviously too lax, and seem determined by their supineness to frown upon and discourage the efforts of their humbler outsiders. As, however, an immense population—equal in number to the inhabitants of many outside districts—live in the City for eight or more hours every day, and the drainage of the offices where they work must be a matter of life and death to them, I should like to know what steps the Commissioners of Sewers are taking to see that sanitary conditions prevail. To the knowledge of all who occupy offices the drains are frequently shockingly bad, and the smells most unpleasant. If anyone falls ill therefrom, the fault is always visited on the dwelling-house in which they reside, and when the illness takes place the vestry official comes in, the drains are taken up, and the danger remains as before, because it is at the office the mischief lurks, and not at the home. The vestries have arranged for house-to-house inspection, but have the City authorities done the same; and if so how far has the inspection gone?"

At the mouth of the river Nervion, which flows into the Bay of Biscay between Portugalete and Las Arenas, a curious engineering structure has been erected, says the Manchester Guardian, within the last few years to transport passengers, cattle, and vehicles without interfering with the river traffic. It consists of a couple of towers 200ft. high, one on each bank; from these a bridge is suspended by chains at a height sufficient to clear the masts of vessels—that is, nearly 150ft. above the water level of the spring tides. This bridge carries a line of rails on which a trolley is pulled to and fro by an engine on the Las Arenas or northern side. With it goes a car, hung by steel cables, in which the passengers take their seats. This is not wound up to the top, but stays at the level of the quays. Thus the transit is effected quickly and regularly, without the delay inseparable from a swing bridge. A similar "pont transbordeur" is set up over the Seine near Rouen by a French company. In general appearance it will resemble the Spanish one, and if equally successful will probably lead to the application of the principle elsewhere. It seems odd that for such a simple and useful device engineers should have to go to Spain.

STAFFORD HOUSE, which is about the most magnificent private house in London, was formerly York House, having been built originally for the Duke of York (second son of George III.), by Benjamin Wyatt, the Architect, with money advanced by the Marquis of Stafford, afterwards Duke of Sutherland, who then lived in the Stafford House of that day, better known to us as Carrington House, which used to stand opposite the Horse Guards. The Duke of York being unable to afford to live in his new palace, sold the Crown lease to the Duke of Sutherland for £72,000. The original cost of the building and the purchase money went to the formation of Victoria Park. The upper story was added by Sir Charles Barry, the Architect of the present House of Commons, who also planned the internal arrangements of the house, which are very fine. The hall and staircase are perfect in proportion, and most harmonious in their beautiful purple and grey colouring, affording the best example in this country of Scagliola decoration. The great dining-room is monumental, and worthy of Versailles, and the picture gallery, 136ft. by 32ft., contains many famous and remarkable pictures from the hands of such masters as Raphael, Titian, Moroni, Murillo Velasquez, Delaroche, Van Dyck, and Watteau, although the original treasures have been much reduced by sales, notably that of the famous Cabinet Lenoir. In the green velvet drawing-room are two Marie Antoinette chairs, which were once in Le Petit Trianon, at Versailles.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

### ANNUAL REPORT OF THE COUNCIL.

WE give the following extracts from the annual report of the Council of the R.I.B.A., as presented and adopted at the annual general meeting held *in camera* on Monday night, under the presidency of Professor G. Aitchison, A.R.A. The only other business of interest was the election of scrutineers to act at the forthcoming election of the Council and Standing Committees, and the appointment of the Statutory Board of Examiners for the ensuing year: During the official year 18 Fellows (of whom 11 were previously Associates), 40 Associates (of whom 18 were Students), and 8 Hon. Associates have been elected. The number of Fellows is now 602, as against 594, and the number of Associates 986, as against 968 at the corresponding period last year. The number of Hon. Associates remains the same, namely 55. Two Fellows have been transferred to the class of Retired Fellows in accordance with the terms of bye-law 13, viz., Messrs. C. H. Howell and S. S. Markham.

#### THE LOSSES BY DEATH

have been as follows:—Fellows: David Brandon, past vice-president, Wm. H. Clark and Henry Crisp (Bristol), F. J. Francis, J. G. Finch Noyes, Stephen Salter, J. W. Trounson (Penzance), Robt. Walker, and Wm. H. White, secretary. Associates: E. Howard Dawson (Lancaster), John Gethin (Cardiff), Frederick Morley (Dublin), Wm. A. Purdue, and C. W. Whittenbury (Manchester). Hon. Associates: Edward Armitage, R.A., Sir John Everett Millais, Bart., P.R.A., Lord Savile, G.C.B., and William Tipping, F.S.A. Hon. Fellow: Edward Falkener; and Hon. Corr. Member: Don. Mariano Belmas (Madrid). The Council deeply deplore the loss of their secretary, William H. White, who was appointed in the year 1878, and held the office until the time of his death, a period of eighteen years. During that period the membership of the Institute largely increased, the present system of examinations came into operation, and the responsibilities of the chief administrative officer were in other ways augmented. Mr. White devoted himself to his duties with the utmost zeal, bringing into play all the forces of a naturally energetic temperament in promoting the knowledge of Architecture and the welfare of the Institute whose interests he had so much at heart, and especially in maintaining cordial relations between it and kindred societies abroad. Mr. White's illness prevented his attending personally, except intermittently, at the Institute after the beginning of last year, although he maintained his interest in its affairs until the last, and his place will be very difficult to fill.

#### THE SECRETARIAL VACANCY

has been advertised, and out of fifty-seven candidates the Council have selected Mr. William J. Locke, B.A. Cantab, who will enter on his duties after Easter; and they have also appointed Mr. Herbert G. Tayler as assistant secretary. During the vacancy in the secretaryship an unusual amount of work has been thrown upon the hon. secretary, and the Council desire to record their indebtedness to him for so kindly carrying it out, and also for the willing assistance rendered by the whole of the staff. The Council also desire to express their acknowledgments to Mr. Alex. Graham, F.S.A., Vice-President, for his services as hon. editor since Mr. White's decease. The Institute has lost a warm friend and generous benefactor in the late David Brandon. The Preliminary Examinations of June and November 1896 were held in London, Manchester, and Bristol, with the result that 165 gentlemen have been registered as probationers. At the same time Intermediate Examinations were held in London and Manchester, with the result that sixty-eight probationers have been registered as students. There are now 872 probationers and 798 students on the respective registers. The final and special examination qualifying for candidature as Associate was

held in London and Manchester in June, and in London only in November last, when, of the seventy-six candidates examined, 35 passed. The Ashpittel Prize was awarded to Mr. T. Denton Brooks (A.) he having most highly distinguished himself among the thirty-five gentlemen who qualified during the year for candidature as Associate. The prize offered by Mr. Cates for the best set of testimonies of study submitted by students for admission to the final examination was awarded to Mr. C. S. F. Palmer (A.), who qualified for candidature as Associate in November, 1896. The Council desire to record their indebtedness to the Allied Societies at Manchester and Bristol, under whose charge examinations have been conducted during the official year; as well as their obligation for the gratuitous services rendered by the London Board of Examiners.

#### THE ROYAL GOLD MEDAL

for the promotion of Architecture was presented to Mr. Ernest George, vice-president, in June last. For the current year Mynheer P. J. H. Cuypers (Hon. Corr. M.), of Amsterdam, has been selected for the honour for his executed works as an Architect, and Her Majesty the Queen has graciously signified approval. Early in the official year the President received a communication from the Right Hon. Joseph Chamberlain, Secretary of State for the Colonial Department, asking him to submit the names of three or four Architects to furnish designs for new public buildings to be erected at Kingston, Jamaica. A notice was inserted in the Journal calling attention to the matter, and inviting applications from members of the Institute and others. A selection was made from those sent in, and forwarded to the Colonial Office, and an intimation was in due course received that Mr. W. H. Harrison [F.] had been selected to carry out the work. The Special Committee appointed in December, 1895, to consider the question of the

#### NOMINATION AND ELECTION OF FELLOWS

have, after numerous meetings and consultation with the Allied Societies, reported to the Council, who have adopted the suggestions made, and these will be submitted to the general body at a special general meeting on the 31st May. A communication was received in June last from the Board of Regents, the governing body of the University of California, stating that it had been decided to prepare a programme for "a general competition for a permanent, comprehensive, and grand plan of the grounds and buildings of the University of California at Berkeley," and asking for suggestions with respect to the preparation of such programme. The matter was referred to the Competitions Committee, who have drawn up some suggestions which it is hoped will contribute to the successful issue of the competition. The present Jubilee year is also the Jubilee of the Architectural Association, and the Council are glad to have the opportunity of expressing their appreciation of the efforts of that body in the cause of architectural education.

#### REPORT OF THE ART STANDING COMMITTEE.

Trinity Almshouses.—Your Committee are glad to report that the threatened demolition of these interesting buildings by the Trinity House Corporation has been averted, the Charity Commissioners having refused their sanction to the scheme. The Committee, having strongly opposed the demolition, consider the result most satisfactory.—St. Mary Woolnoth. This building has also escaped its threatened destruction. Although the House of Commons inserted in the City and South London Railway Bill certain clauses for the purpose of protecting the Church, these clauses were struck out by the House of Lords. The House of Commons, however, reinserted them, and they were finally agreed to. In this matter also the action of your Committee greatly assisted to avert the destruction of the Church.—New County Hall for London. Your Committee, having taken much interest in the proposed site for the intended new County Hall, were invited to an informal con-

ference with some of the principal members of the County Council, and certain of the head officials. The chairman, Mr. W. Young, and the honorary secretary, were delegated for this purpose, and the meeting was held on Friday, December 4th, 1896. The views of the committee were laid before the Conference, and the committee were thanked for the trouble they had taken in the matter.—Preservation of Old Buildings. At the invitation of the London County Council your Committee consented to prepare a list of buildings in London which may be said to possess historic and architectural interest. With this view they obtained your consent to invite the

#### CO-OPERATION OF OTHER SOCIETIES

interested in the matter. Afterwards, however, the London County Council themselves called a meeting for the consideration of the subject, to which your Committee were invited to send three representatives. After considerable discussion it was decided that it is desirable to prepare a register of the old buildings, and that a general committee should be formed of the various societies represented at the Conference, the matter being left in the hands of the London County Council.—Carfax Tower, Oxford. The Committee have had some correspondence with the municipality of Oxford respecting this tower, and after carefully inspecting photographs of the Church, together with measured drawings prepared by Mr. Hare, and hearing the opinions of those members of the Committee who had inspected the building, decided to report that there is nothing in the tower of architectural interest, and that some scheme for remodelling it is desirable.

#### REPORT OF THE PRACTICE STANDING COMMITTEE.

The question of the payment of Architects' fees by fire offices in connection with the reinstatement of buildings after fires has been further considered by the committee. After correspondence and negotiations with the principal insurance companies through their association, a report thereon was submitted to the Council. Letters were referred to the committee by the Council respecting Architects participating in the commission of Quantity Surveyors, also respecting charges and duties of Architects and other matters, and reports have been made thereon to the Council. The proposed new bye-laws of the London County Council regarding drains were considered, and a report thereon, suggesting amendments, was made to the Council. The amended paper on the subject of the professional charges of Architects prepared by a sub-committee has received much attention, and is still under consideration.

#### REPORT OF THE SCIENCE STANDING COMMITTEE.

The experiments in brickwork testing have been continued. A further series of experiments is in hand at the present time. These have reference more particularly to brickwork in walls as distinguished from those previously held in regard to brickwork in piers, and the committee have again to acknowledge their obligations to Sir William Arrol and to the London and India Docks Joint Committee for the valuable assistance rendered by them in regard to these experiments. The committee hope in due course to issue in pamphlet form the results of the whole series of experiments.

The report of the Literature Standing Committee contained nothing of moment.

THE tenders for the great extension of Ostend harbour and docks, which was provisionally estimated to cost nine millions of francs (£360,000), have been opened at the offices of the Provincial Government at Bruges. One half of the cost is to be paid by the town of Ostend, and the remainder by the Belgian Government. There were three tenders only—that of a firm at Roulers, West Flanders, 9,435,800f.; a Bruges firm, 9,470,000f.; and a Paris firm, 12,340,930f. The tenders will be submitted to the Government at Brussels for final decision.

## Professional Items.

**ABERDEEN.**—The following is taken from the report of Mr. Munce on the designs for the new fire brigade establishment:—In compliance with your request, I beg to report as follows: Every one of the designs showed considerable study by its author. After examination and consideration, four of them showed marked superiority in arrangement. Design No. 2 is placed first, its arrangement being better than any of the others, although it would require some modification, still the variations would be less than in any of the other plans. The elevation would be very much improved by a small expenditure. The estimated cost of the design (£10,400) is lower than that of any of the others, so that there is room for improvement without exceeding the cost of the next in order of merit. No. 12 has a pleasing elevation, but the plan of the fire department has been injured through placing the weights and measures department in front, and thus practically putting the firemaster's dwelling on the second floor. This could be amended by placing the weights and measures department at the rear. No. 14 has the same defect as No. 12, but would be more difficult to amend—there are too many staircases. No. 18 has the engine-room, stables, &c., well arranged on the ground floor, but the upper floors would be found difficult of access, and the whole arrangement would prove dangerous and inconvenient, with a want of privacy. The yard could not be confined to the fire department, and therefore would be practically useless for drill, and would increase the difficulty of supervision. Although the elevation of No. 2 is not so imposing as some of the other plans, it is placed first on account of its arrangement, and No. 12 second. If the committee decide to carry out any of the designs, it would be well to combine the best points of the two plans.

The plans of the new theatre to be erected in Rosemount Viaduct are now in an advanced stage of preparation. The old houses on the site are to be demolished immediately after Whit Sunday, and building operations begun. It is claimed that the building will be one of the safest and most completely-equipped theatres in Scotland.

**AMBERGATE.**—The new Church at Ambergate has just been internally improved. The altar steps and communicants' dais, formerly composed of wood, have now been taken up and replaced by marble. That of the communicants' rail is of black Derbyshire marble from the Ashford quarries, and the other is red Belgian marble, while the altar now stands of white Italian marble, from the famous Carara quarries, Italy. The idea carried out in the new work is from the passage in Dante's "Purgatorio," and is symbolical of Christian progression. The work has been carried out by Mr. Berresford, of Belper.

**ASHOPTON.**—A new Wesleyan chapel and school at Ashopton, in the Bradwell circuit, were opened on the 22nd ult. A better position for the chapel than the old site could not be found, situated as it is by the side of the Sheffield Road in the centre of the village. Mr. J. G. Ronksley, of Sheffield, gave land upon which to erect a new chapel adjoining the old building, which remains in use as a Sunday school. The work has been carried out by Messrs. Alfred and Hedley Hill, of Tideswell and Litton, and the Architect is Mr. Herbert W. Lockwood, of Sheffield. The estimated cost was £760.

**BELFAST.**—One of the few remaining landmarks of old Belfast a century ago is now in process of demolition to clear the ground for a palatial block of buildings about to be erected for the Directors of the Scottish Provident Institution. The site forms a portion of the large plot of land extending from Wellington Place to Wellington Street, and from Donegall Square West up to and including the premises on which the buildings of the Young Men's Christian Association stand. The new insurance

building for the Scottish Provident will occupy a space of about 100ft. square, leaving the remainder for future development. They will be in the Palladian style of Italian Architecture, executed in white stone, with a lofty columnar order, resting on a rusticated stylobate, and crowned with richly-moulded cornice and balustrade above 80ft. in height. An octagonal dome placed at the angle will rise 120ft. Below it will be placed the separate imposing entrance to the insurance office, another porch, with electric lift and stone staircase, accommodating the various suites of offices on the upper floors. The plans of the entire block have been prepared by the Architects, Messrs. Young and Mackenzie.

**BLACKPOOL.**—An inspector of the Local Government Board has attended at Blackpool to inquire into an application for sanction to borrow money for the extension of the gas works and other municipal purposes. It is sought to spend about £10,000 on new mains, meters, and lamps. Application for other moneys was made in respect of a proposed underground convenience at the westerly end of Station Road, South Shore, and for works of street improvement in different parts of the town.

**BRECHIN.**—The plans of the proposed Joint Infectious Diseases Hospital and the site have been finally approved of. The scheme for a joint hospital was agreed upon some considerable time ago; but difficulties cropped up which threw the arrangements back. Altogether there will be four blocks of buildings—two ward blocks, an administrative block, and a mortuary block. Each ward is provided with a bathroom. In each block is a nurse's room, with small projecting window overlooking the wards. A small scullery is also provided in each block. The administrative building consists of matron's room, living room or kitchen, with scullery, pantry, coalhouse, servants' bedroom, and dispensary, on ground floor; and two large bedrooms and bathroom on first floor. The mortuary block contains mortuary, ambulance shed, washing-house, disinfecting chamber, store for patients' clothes, coalhouse, and other offices. The heating and ventilation have received special consideration. Each grate admits a supply of fresh air heated as it passes into the ward. There will be a fresh air inlet at the floor level under each bed, and this will be used in hot weather, while another inlet six feet above the floor, fitted with a patent fresh air warmer, will admit the air during colder weather. Patent extract ventilators will be fitted up in the ceiling, and mica flap-ventilators in each flue. The buildings are designed so that they will easily admit of future extension. The walls are to be of red pressed brickwork, and the roofs covered with green slates. The inside walls are to be finished with highly polished cement. The floors are to be of narrow pitch pine, closely screwed up and dressed off very smooth. A layer of dry shivers covered with asphalt will be laid under all floors, and the spaces under floors will be thoroughly ventilated. The Architect for the work is Mr. T. Martin Cappon, of Dundee and Brechin.

**BRIGHOUSE.**—The newly-erected St. Andrew's Mission Church in Thornhill Road, Brighouse, was dedicated recently. The building has been erected from designs by Mr. E. C. Brooke, Architect, Brighouse, at a cost of about £1000.

**BRIXTON, S.W.**—A music hall is to be built by a syndicate, which has acquired a freehold site opposite the Turkish baths in Carlton Grove, and plans have been prepared by Messrs. Wilson and Long. The erection will be commenced in the course of this month, and the hall when completed will be capable of seating nearly 3000 people. Its cost will be between £17,000 and £18,000.

**DERBY.**—The Bishop of Derby, who presided at the annual vestry meeting, said that Mr. William Smith was about to present some carved oak choir stalls for the chancel, and also an oak screen, in memory of his late

parents. It had been estimated by Sir Arthur Blomfield that it would cost about £3000 to repair and complete the Church tower, and it was hoped that next year action would be taken with the view of securing funds for this work. The designs for the chancel screen were being drawn, and would be laid before a future vestry meeting.

**DUNDEE.**—A very important architectural improvement at the West Port will be begun on an early date in the erection of a new block of buildings for the branch office of the British Linen Company Bank. The site is at present occupied by the Bank and other buildings, and covers a large area of ground. The buildings have frontages to West Port and Brown Street, and consist of two blocks. It is the intention of the bank authorities to demolish the block fronting West Port, and erect a new and commodious building, which should form an outstanding feature in the Architecture of that thoroughfare. The plans for the new office are almost completed. The purchase of the site, it may be mentioned, was made from the directors of Dundee Royal Infirmary.

**GLASGOW.**—The students attending Mr. D. Bennet Dobson's High School classes paid their monthly visit to works of note to the Glasgow Art Galleries, in course of erection in Kelvingrove Park. It is now 3½ years since the works were started, the basement and first floors being now pretty well advanced. The total cost of the buildings will amount to about £174,000. The external stone used is from Locharbrigg's red quarry, Dumfries, and in the two stories erected gives a bold effect. Most of the interior is to be lined with white stone, which is from Giffnock quarry, near Glasgow. The main entrance, which is from Kelvingrove Park, is beginning to show to great advantage. The Grand Hall occupies a prominent part in the building, being well over 125ft. high. On the ground floor it is proposed to place museum exhibits, and in the galleries above, the pictures. Two very fine central towers will flank the main park entrance, and will be over 150ft. high. Messrs. Peter McKissock and Son, whose contract for the mason work is £116,905, have five moulding machines at work, in addition to sawing ones, producing work even superior to the hand-work. The resident Clerk of Works conducted the students, who appreciated the visit, and at the close accorded the customary vote of thanks to Messrs. Simpson and Milner Allen, the Architects, of London.

The most recent addition to the schools erected by the Glasgow School Board—Rosemount Public School, Milburn Street, Garngad Hill—has just been opened by Sir John Neilson Cuthbertson. The school is erected on a site at the highest point of Garngad Hill. The school and class rooms, sixteen in number, and varying in size from accommodation for 173 to 62 scholars, are grouped round the central hall on two floors, and provide places for fully 1203 children, of which 608 are for infants at eight square feet each, the remainder being at ten square feet. The plenum system has been adopted for the heating and ventilation. The building is very simply treated externally, but the necessity for ample lighting has been adequately recognised, the windows forming the principal feature of the elevations. The walls are of red sandstone, from Ballochmyle quarries, finished in squared rubble with polished dressings. The playgrounds, which are very extensive, are laid with tar-macadam paving. The total cost, exclusive of site, is expected to come within £13,000. Mr. J. B. Wilson, Glasgow, was the Architect.

**GRESHAM.**—The School Board authorities have approved of plans and accepted an inclusive tender of £2800 for the erection of new premises. The site selected is near the Church, and, although in the vicinity, is on higher ground than the present schools. The new buildings, when complete, will give accommodation for 178 children. Towards the entire cost of the work the Board has had sanction to borrow £3035.

**HANDSWORTH.**—The opening of the new school in connection with the Handsworth Congregational Church, and reopening of the chapel, took place on the 28th ult. The new school includes a room capable of seating 300 to 350 adults and an infants' schoolroom, while the existing school has been divided into ten commodious classrooms, outbuildings, &c. Heating of all the school premises is by hot-water apparatus. The church has also been redecorated, and the lighting of the buildings has been rearranged. Total cost, including site of the new school, is about £1,600.

**HEXHAM.**—Plans for the new grammar school at Hexham have been laid before the Technical Education Committee of the Northumberland County Council by Messrs. Oliver and Leeson, Architects, Newcastle. A site of about four and a quarter acres, immediately to the south of Hexham, has been secured. The plans provide accommodation for 150 boys, thirty being boarders. The main entrance doorway to the school is in the centre of the principal front, and, passing through this, access is obtained to a handsome hall and staircase leading to the dormitories on the first floor. At the left of the entrance is the school hall, a lofty room lighted from both sides, whilst beyond are class-rooms of various sizes. To the south of the class-rooms, in a separate wing, is the physical laboratory. On the first floor, over the class-rooms, are the chemical laboratory, preparation room, and lecture theatre, with a special science classroom. There will be separate cloak-rooms and lavatories for the day boys and boarders, and a common room for assistant masters. On the right of the main entrance is the boarders' common room and dining-hall, and beyond that the head master's house. Separated from the main building is a covered playshed for the boys and a large room for manual instruction. The buildings are proposed to be carried out in stone, an admirable quarry being situated a very short distance from the site; and the roofs are to be covered with green slates.

**HORRINGTON.**—New and spacious Board School premises were opened a few days ago. The buildings are of native stone with Douling stone dressings and are of a substantial character, with ample playgrounds and offices. The contract amounted to a little over £1100.

**HULL.**—The new Sunday School built in connection with Queen's Road Wesleyan Chapel has now been opened. The school marks the completion of a scheme formulated twenty years ago. Accommodation is provided in the central hall for about 700 scholars. Attached there are an infants' schoolroom, and twelve class-rooms, a church parlour, minister's vestry, and the usual kitchen and offices. The cost of the building is about £3500, the greater part of which has already been subscribed.

**KIDSGROVE.**—The foundation-stones of the new Victoria Hall and public offices about to be erected by the Urban District Council were laid a few days ago. The site of the new buildings is the gift to the Urban District Council of Messrs. Robert, James, and A. H. Heath, and occupies an elevated position on the east side of Liverpool Road. It is proposed to erect buildings for the accommodation of the council, and a hall for public meetings, &c., a fire station, and a town yard. Messrs. Wood and Hutchings, of Tunstall, are the Architects; and the tender of Mr. Charles Cope, of Tunstall, for £2046, has been accepted. It is probable that a tower and clock will be added, to commemorate the Diamond Jubilee of the Queen, but this is not included in the present scheme.

**LEEDS.**—The Watch Committee of the Leeds Corporation has resolved to accept the tender of Messrs. Appleby Brothers, of Bramley, for the erection of a new police station at Upper Wortley, the cost being £2760. The committee has considered the question of providing a new police station for East Leeds, but, however, has decided not to erect a station

there. The question of a new police station for Woodhouse was adjourned till the next meeting of the committee.

**NEWCASTLE.**—The Newcastle Finance Committee has agreed to accept the offer of the Water Company to give up immediate possession of the offices in the Police Court buildings, which will enable the Corporation to carry out the contemplated structural alterations, which include the making of a second court of the large room lately occupied by the directors of the Company, the removal of the existing offices, and the formation of solicitors' rooms, waiting rooms for witnesses, and also a room for the holding of Watch Committee meetings. It is also proposed to make certain alterations in connection with the present magistrates' room. There will be two entrances to the premises, one from Pilgrim Street, and the other from Worswick Street.

**OXENHOPE.**—The foundation stones of the new Wesleyan Sunday School at Oxenhope were laid on the 24th ult. The school will occupy a site to the west of the present chapel, and will take the place of premises which are too small. The new buildings will consist of an assembly room, a gallery, an organ recess, library, lecture room, infants' schoolroom, and other rooms. The site has cost £600. The outlay on the buildings is expected to be £4200.

**QUEENSTOWN.**—The Queenstown Custom House, as it is called, is about to be taken down and a new building erected on the site of the old one. The old building has been in use for a long period for a Government structure, and for an important seaport town such as Queenstown is, it is strange that such an inconvenient building was made to do duty for such a long period. It is nothing better than a boat-house, with a few dingy rooms overhead totally unsuited to the requirements of the place.

**RASTRICK.**—The corner-stone of new premises for the Rastrick and Fixby Conservative Association was laid on the 24th ult. The new premises are being erected in Church Street, Rastrick, from plans prepared by Mr. A. E. Halliwell, Architect, Brighouse. On the ground floor they comprise two lock-up shops and caretaker's house. On the first floor are news, smoke, billiard, and secretary's rooms.

**SHEFFIELD.**—The whole of the faience used in the decoration of the Prudential Assurance Company's new building at the corner of Pinestone Street, adjoining St. Paul's Churchyard, a description of which we gave in our issue of April 14th, was supplied by the Leeds Fireclay Company, and was their well-known Burmantoft's ware.

**STRADBROKE.**—For upwards of a century no repairs were done to the bells of Stradbroke Church; consequently their condition became such that action was imperative. Two years since Mrs. Morgan-Kirby commenced active work to secure the required fund, and succeeding in obtaining nearly £100, the cost of the work. It has now been executed by Messrs. H. Bowell and Son, bell founders, Ipswich, they having rehung the bells in an English oak frame, with new fittings.

**SWANSEA.**—A new chapel has been erected in Henrietta Street, from designs of Mr. W. Williams, by Mr. H. Billings, contractor. The building will seat 500 persons, and has cost about £2500.

**SWINDON.**—A new theatre is to be erected at New Swindon from designs prepared by Messrs. E. Milverton Drake and J. M. Pizey, Architects, Bank Chambers, Baldwin Street. The theatre will accommodate about 1600 persons. Three sides of the theatre abut on public streets, which admits of a most complete arrangement of exits and entrances. It is to be well provided with dressing-room and bar accommodation, and heated with hot water. The height of the auditorium from

the pit stalls to the sun burner is 40ft. The proscenium opening, boxes, and internal decoration generally will be Italian Renaissance very artistically treated. Ample means of ventilation are provided. Externally the building will be of brick and freestone, and is of a very imposing character. It is to be called the Queen's Theatre, and will be opened about the beginning of October. The plans have been duly passed by the District Council and the Wiltshire County Council.

**WANSTEAD.**—A new building, known as Grove Hall, has just been opened. The building has cost upwards of £2500, and it will seat over 500 people. The Architect was Mr. E. N. Whitaker, and the builder Mr. J. Jolliffe.

**WAVERLEY.**—Another important stage in the work of reconstructing and enlarging the Waverley Station and its approaches has been reached by the completion of the new double line of rails between Waverley and Abbeyhill, and of the new up main line platform. Its construction involved the removal of, among other buildings, a large grain store, and Dryborough and Bernard's breweries, and the setting back of the North Back of Canongate to the foot of the Calton rock. It also involved the cutting of a new tunnel through the Calton Hill, and the carrying of the double line of rails to Abbeyhill Junction. Extensive operations were thus necessitated over a large area, but the work has been pushed forward by the North British Railway Company's engineers and contractors. While access to the station by the Waverley steps will be preserved, the principal approach will still be from Waverley Bridge, but there will be two inclined accesses in place of one as at present, and the gradients will be slightly improved, as the new booking office will be further east than the present one. Opposite the foot of the inclined accesses there will be a large block of new offices. The west portion of this block will contain a large booking hall, about 75ft. square, in the centre of which will be the booking office, while the principal waiting-rooms will be grouped around it. Four wide passages will lead direct from the booking hall to the platforms, one leading to the main up platform, another to the main down platform, and two to four docks at the east end of the station. For the four docks at the west end there will be separate booking-office accommodation near the foot of the inclined accesses. The suburban double platform will be covered by a verandah roof, will have separate offices and waiting-rooms, and will be connected with the main station by bridges both for passengers and luggage. The construction of the roof of the new station has been limited to a height of 42ft. above the rails, which is a very low elevation for a roof covering such a large area. It has, therefore, been designed so as to look as light as possible, and will be carried on light steel lattice girders resting on ornamental cast-iron columns. Substantial progress is being made with the work of reconstruction. The booking hall is rapidly approaching completion. The walls have been finished and the roof is in a forward state. The hall is a commodious one, and will be a striking feature of the new station. Work has also been begun in connection with the building of the hotel.

**WORKSOP.**—The scheme for the enlargement of the schools connected with St. John's parish at Worksop is now complete. The enlargement has taken place at the Eastgate and Dock Road Schools, and the cost is over £1000. The result is increased accommodation for about 500 scholars.

The ancient Baptist Chapel at Nantwich, with its old-fashioned burial ground, in which the body of Milton's wife was laid to rest, has been sold by public auction for £130.

A statue erected in Hyde Park, Sydney, to the memory of the Right Hon. William Bede Dalley, one of the principal statesmen of the colony, and the first Australian statesman to be made a Privy Councillor, was unveiled by the Governor recently.

## Trade and Craft.

### ELECTRIC LIGHTING AT BELFAST.

The Electric Lighting Committee's report, which has been adopted by the Belfast Corporation, approves of plans, specifications, and estimates prepared by their Engineer for the proposed new installation, and recommends the Council to authorise an application being made to the Local Government Board for their sanction to the Council's raising a sum not exceeding £65,000 for the first section of the undertaking. The committee purposes laying down a small portion of the plant as soon as the makers can supply it, and in the meantime pushing on with the erection of the station buildings and the laying of the wires.

### THE ANAGLYPTA COMPANY.

The illustration we give represents an excellent design received from the Anaglypta Co., and intended as a commemoration shield for the Queen's Diamond Jubilee. It is made in Anaglypta in very high relief, and is suit-

able for either outdoor or indoor decoration. The Company has also issued a sheet of drawings giving suggestions as to how the shield can be arranged with flags to make a trophy to the best advantage.

### MESSRS. STRODE AND COMPANY.

We have received from Messrs. Strode and Company, of 67, St. Paul's Churchyard and 188, Piccadilly, copies of special electric Diamond Jubilee illumination designs prepared by them. There is an originality about some of the designs only equalled by their appropriateness. We would specially mention a patent device representing an Imperial crown. The arrangement of this design is very effective. Only a few incandescent lamps are required, the light being reflected on to a background of glittering gold, with the jewels, represented by coloured lamps, showing up in strong relief, and the effect thus obtained is very pleasing. The same arrangement is also applied to mottoes and other devices. For outlining buildings with electric lamps, Messrs. Strode have a method by means of which damage to the structure is avoided, and any number of lamps can be fixed up in a very short space of time. Devices and mottoes can also be traced out with electric lamps and various colours embodied, adding greatly to the effect. Another speciality for outlining buildings will be white or coloured moons, a rather ingenious device which converts a small incandescent lamp into a handsome globe. The same idea is also adopted with balloons. They are very suitable for festoons, and are particularly effective when used in illuminating gardens or trees. Special arrangements are being made to meet the great demand for electric current.

### DISCOVERY IN STEEL MANUFACTURE.

The art of producing steel is reckoned among those which are lost. The old swords hailing from Japan or India will simply cut clean through our modern steel without their edge

being spoiled in the least. Some progress has recently been made towards the recovery of this Art by a brother of Mr. Hiram S. Maxim, who resides in the United States, and has sent small quantities of steel over here to be tested. Mr. Maxim's brother has drawn his information from old Hindoo sources, and at his first experiment succeeded in making a drill which would cut its way with perfect ease through a file made of the finest metal we can produce nowadays. Of the process of manufacture nothing is as yet publicly known, and it has not yet been placed on the market. Mr. Maxim is said to regard it as merely the prelude to more important discoveries still in the same direction.

### THE TRAMWAYS AT BIRMINGHAM.

There is an interesting sequel to the report of the Special Tramways Committee sent out by the Birmingham Corporation to investigate the various methods of electric traction. The inevitable quarrel as to the terms of the lease is sure to follow, and at the present moment Birmingham is excited because the Tramway Company refuses to carry out the wishes of the Special Committee. The Company contends that it is only bound to lay a portion of the tramway on the conduit system—not more than ten miles out of the twenty-four or twenty-five miles of existing tramways. The Corporation, on the other hand, denies any definite agreement as to a limit. It is admitted by the Corporation that any conduit line laid in excess of eight miles must be bought up at a valuation on terms agreed upon, when the lease terminates. Hence the deadlock.

### MESSRS. WEBB AND CO.

Messrs. Webb and Co. have concluded arrangements with the Della Robbia Pottery Co., whose beautiful ware attracted so much attention at the recent Building Trades Exhibition, and have a fine collection of this pottery on view at 292, Euston Road. We would strongly advise all those interested in this class of mural decoration to visit Messrs. Webb's show-rooms. The collection comprises figure and ornamental panels in high and low relief, for friezes, spandrels, lunettes, jambs, pilasters, all of the most beautiful designs, many by well-known Artists; and we understand some panels are in preparation from pictures by Rossetti and Burne-Jones.

The Rugby Urban District Council has just completed the purchase from Mr. B. H. C. Fox, for £8000, of eighty acres of land, on the north side of the town, chiefly for sewage disposal purposes.

Mr. J. Wolfe Barry, C.B., has been elected President, and Mr. W. H. Preece, C.B., Sir Douglas Fox, Mr. James Mansergh, and Sir William Anderson, K.C.B., Vice-Presidents of the Institution of Civil Engineers.

A PUBLIC hall and library is shortly to be erected at Briton Ferry. Several houses have now been purchased, and the site selected is Lowther Street. In addition to a library and reading-room there will be three rooms for the Urban District Council, and bank premises, Masonic hall, and shops.

The officers of the Cambridge Volunteers are appealing for funds for building a new armoury. What is desired is a building which shall contain an armoury, offices for the Commanding Officer and Adjutant, office for the Sergt.-Major, and a band-room. Colonel Fawcett estimates the cost of the required alterations at £800.

RIGHT in the centre of the manœuvring ground of the German Garde du Corps, between Spandau and Potsdam, lies an old village called Döberitz, the Church of which is said to be almost 1000 years old. The military authorities having acquired the whole of the ground—about four square miles in extent—by legal expropriation, the inhabitants of the village were forced to quit. An order has been issued by the General Staff to the effect that large barracks are to be erected on the site of the village, which is to be demolished, and with it the Church.

## Correspondence.

### R.I.B.A. ELECTIONS.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—A doubt has been expressed as to the accuracy of the statement that a large proportion of the members do not vote at the annual elections for the Council. The following are the actual figures from the Institute Journal, in reference to the last election. There were only 468 envelopes sent in containing the voting papers, and twenty-nine of these were spoiled by informalities, no candidate obtained more than 391 votes, although the total number of members with voting powers was then 1581, therefore no less than 1113 neglected or refused to send in their votes. It is to be hoped that there will be more voters this year, and that they will consider six new members of the Council, with twelve old ones, to be a fair proportion. The best way to secure this result would obviously be to "plump" for new candidates only, for it is absolutely certain that twelve, at least, of the existing Council will be returned.

Yours faithfully,

A METROPOLITAN FELLOW.

London, April 29th, 1897.

To the Editor of THE BUILDERS' JOURNAL.

Dear Sir,—The fact that 60 existing members (out of 64) have nominated themselves for the standing committees should be widely known. The best thing to be done under the circumstances will be to "plump" for new candidates, as in any case a large proportion of existing members must necessarily be returned. As seventeen of the existing council are renominated for eighteen seats it is desirable that all members vote, and for new men only; the existing seventeen members will, no doubt, be well looked after by their own friends, and, as they have nominated themselves, will probably also vote for each other, but a few of them should make place for new blood.

LONDON ASSOCIATE.

April 28th, 1897.

THE "special defence works" of India, which have been in progress for twelve years and have cost more than £3,000,000, but nearly £200,000 less than was originally estimated, are now practically completed.

The inauguration of the new waterworks at Worthing, which, together with other local improvements, have been constructed by the Corporation at a total cost of over £100,000, took place on the 26th ult.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two.

Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

Strand, W.C.

## SOCIETY MEETINGS.

**The Architectural Association.**—Mr. Beresford Pite presided at an ordinary meeting of the Architectural Association, held on Friday evening, at which votes of thanks were accorded Messrs. Legg and Son for granting the Association permission to visit the Royal Palace Hotel extension, and to Mr. Banister F. Fletcher for permission to visit 27, High Street, Kensington. It was announced that the following had been reinstated members of the Association: Messrs. E. Dru Drury, S. R. J. Smith, A. H. R. Tenison, Keith D. Young, and H. Gray Robins. In announcing that the annual dinner of the Association will be held to-night (May 5th), the President said the event was especially attractive as it celebrated the Jubilee of the Association. The Committee had invited all the past Presidents of the Association, and their guests would include such a distinguished orator as the Lord Chief Justice of England, and such an authority as the Bishop of London. To-morrow (Thursday), at three o'clock, a conference will be held at 9, Conduit Street, to discuss the work of the Association in its several aspects. Tea will be provided before the soirée, which takes place in the evening at St. George's Hall, Langham Place, and at which a musical play, written by Mr. E. Howley Sim, will be produced.

**Edinburgh Architectural Association.** At an ordinary meeting of the Edinburgh Architectural Association, Dr. R. Rowand Anderson, President, in the chair, a large number of drawings of old Scottish work by students of the Applied Art School were exhibited, and explanatory historical and architectural notes on them were read by Mr. J. Forbes Smith and Mr. Ramsey Traquair, students. Among the subjects of the drawings were Holyrood Abbey, Craigmillar Castle, Argyll's Lodging at Stirling, and Cowane's Hospital. The Chairman, in proposing a vote of thanks to Messrs. Ramsay Traquair and Smith for their communications on the interesting buildings they had been studying, said that the Association, in devoting one of its evenings to an Exhibition of the work of the students of the Applied Art School, was desirous to make it known, especially to those who were to follow Applied Art, that the Association was doing its best for them, because it made annually a subscription from its limited means to forward the cause of education, and did not limit its subscription to benefiting those only who were to follow Architecture, but gave its support to a school which, in carrying out its system of education, made no distinction between the Architect and all other Art workers—that was to say, that the scholarships and other rewards at the disposal of the school could be obtained and held by the Decorator, the Sculptor, and any other Art-worker equally with the Architect. The Association also desired to emphasise the great importance of the study of ancient work, in all its departments, as a true foundation for the future work of the Artist.

The members recently visited Bavelaw Castle, near Balerno. Mr. Frank W. Simon, Architect, who conducted the party, described the castle, and Mr. Glover, factor for the property, supplemented Mr. Simon's description. A vote of thanks was given to Mr. Gulland and Mr. Robertson, who had given permission of inspection, and to Mr. Simon for his descriptive notes.

**Devon and Exeter Architectural Society.**—The annual meeting of the Plymouth, Devonport, and Stonehouse branch of the Devon and Exeter Architectural Society was recently held at the Plymouth School of Art. Mr. Charles King presided. The report was considered very satisfactory; meetings and excursions have been held at regular intervals during the year. The ballot for the election of officers resulted as follows: Chairman, Mr. C. King, re-elected; committee, Messrs. H. G. Luff, M. A. Bazeley, B. P. Shires, J. H. Dwyer (re-elected), and A. G. Bewes; hon. secretary and treasurer, Mr. Edgar M. Leest, re-elected.

**Glasgow Archaeological Society.**—At a recent meeting of the Archaeological Society of Glasgow Mr. David Murray, LL.D., presided, and Mr. John Orr, Newhall Terrace, exhibited the upper stone of a quern found near Glasgow Green, and a number of perforated sink stones. The chairman read a description of the stones and of the positions in which they were found. The quern stone was got in 1894 by Mr. Orr in the construction of a sewer, and the sink stones were found in the gravel bed of the Clyde near Rutherglen Bridge. The latter were probably used by salmon fishers to weigh down their nets.—Mr. P. Macgregor Chalmers, Architect, read a paper on the vaulting of the lower Church of Glasgow Cathedral, in which, criticising the theory recently promulgated by Mr. T. L. Watson, Architect, he said that a careful examination of the building showed that there was no evidence that there had been any intention to carry out any design other than that existing in the centre aisle. The evidence of the building left no room for doubt that, whilst some parts of the work betrayed want of skill, the present design was as originally projected.

**The Engineers' Association.**—The members of the Incorporated Association of Borough and Municipal Engineers held their annual meeting at Dover on Saturday, the 24th ult. The president, Mr. F. May, of Brighton, was supported by a very large number of engineers from London and other important centres. Two papers were read by Mr. Stilgoe, Dover, borough engineer, on the municipalisation of scavenging and the tramways just adopted at Dover, the latter being an electric overhead system. The meeting was in complete agreement as to the value of municipal control in such matters. Mr. Walmisby, engineer to the Dover Harbour Board, also read a paper on sea defence works.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

UNEQUALLED FOR ALL DECORATIVE PURPOSES.

# Aspinall's

## ENAMEL.

**DURABLE AND EFFECTIVE.**

**READY FOR USE.**

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard, impervious surface as washable as Porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where Sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for ALL Decorative Purposes.

Builders and Decorators should apply for full particulars of our special "DECORATORS' ENAMEL."

## CONTRACTS OPEN.

### COUNTY BOROUGH of WEST HAM PRIVATE STREET WORKS. TO CONTRACTORS.

The Council hereby invite TENDERS for MAKING-UP and PAVING the following streets:—  
Balmoral-road, Forest Gate.  
St. George's-square, Forest Gate.  
Plaistow Park-road, Plaistow.  
Russell-street, Plaistow.  
William-street, Stratford.  
Robertson-road, Stratford.

Plans may be seen, specification, form of Tender, and further particulars obtained at the Office of Mr. LEWIS ANGELL, Borough Engineer, Town Hall, Stratford, E., on payment of One Pound, which will be returned on receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Private Street Works," to be sent to my Office not later than FOUR o'clock on TUESDAY, MAY 11th, 1897.

The Council do not bind themselves to accept the lowest or any Tender. The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to pay to the who'e of his workmen such rate of wages, and observe such hours of labour, as are recognised by the workmen's trades unions, and in force at the time of signing the contract. In the event of any breach of such agreement, the Council will enforce the penalty clause in its entirety.

By order of the Council,  
FRED. E. HILLEARY,  
Town Hall, West Ham, E.,  
April 28th, 1897.

**BOROUGH of ROTHERHAM.**  
The Baths Committee of the above Corporation are prepared to receive TENDERS for the WORK

# M'NEILL'S FELTS M'NEILL'S SLAG WOOL

(Roofing, Inodorous, Sarking, Dry Hair, Damp Course, etc.)

(Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

Lists, Samples, and full particulars free on application to

**F. M'NEILL & CO.,** Head Office, Bunhill Row, London, E.C.; Slag Wool Works Kirkintilloch, near Glasgow.

## THE UNITED ASBESTOS PATENT

# "Salamander"

**Gold Medal  
Awarded.**

NOVEL APPLICATION OF ITALIAN ASBESTOS IN EMBOSSED WALL AND CEILING DECORATIONS IN HIGH AND LOW RELIEF.

## Decorations

Designs by Leading Artists, capable of infinite variety of Decorative Treatment.

PRICES RANGING FROM 8d. PER YARD TO 7s. 6d. PER PANEL.

"It cuts smoothly and hangs easily."—*Journal of Decorative Art.*

"One cannot well over-estimate the importance of a fireproof covering to walls and ceilings. Many a fire has been materially assisted in its progress by wall-paper, and a substance capable of being adapted to such uses, and of an ultra fireproof nature, had long been sought."—*The Architect.*

Fireproof.

Plaster Effects at much below cost of Plaster.

Easily Hung.

Very Light in Weight.

"SALAMANDER"

"SALAMANDER"

TRADE MARK.

TRADE MARK.

No. 1032. FRIEZE. Size, 11in. by 30in.

IMPORTANT.—Our Patent "Salamander" Decorations are being extensively used in H.M. Navy as a Protection from Fire. PATTERNS MAY BE SEEN AT ALL THE LEADING DECORATORS.

For Illustrated Price List fill up and send this slip to—

## The UNITED Asbestos Company, Ltd.,

SOLE MANUFACTURERS AND PATENTEES (WHOLESALE ONLY).

158 & 190, Charing Cross Road, LONDON, W.C.

HEAD OFFICES: DOCK HOUSE, BILLITER STREET, E.C.

(BUILDERS' JOURNAL.)

required in the ERECTION of a SWIMMING BATH in Market-street, which will comprise the following:—

- (1) Brick and Stone work required on the top of each pier.
- (2) Brick work forming the bed and side walls, and Glazed Bricks, Flags, and Concrete flooring round the Bath.
- (3) Brick and Stone work required for the super-structure.
- (4) Joiner's Work for Windows, Doors, and Dressing Boxes.
- (5) An Iron Roof to be erected, Glazed and Slated complete, also Glazing Windows.

Parties may Tender for the whole of the work, or separately for different classes of work, or may Tender in both forms.

The work is to be carried out in accordance with the drawings and specification prepared by Mr. W. ECKERSLEY, and to his entire satisfaction.

Plans and specification may be seen, and form of Tender obtained, upon application at the Town Clerk's Office, Howard-street, Rotherham.

The Contractors must not pay less than the standard rate of wages paid in the district, and must observe the proper conditions of labour, and no sub-contracting will be allowed except by permission of the Corporation.

Tenders to be sent in to me not later than the 14th May next, endorsed "Tender for Bath."

By order,

H. H. HICKMOTT,

Town Clerk.

Council Hall, Rotherham,  
April 23, 1897.

### LEYS MALLEABLE CASTING CO. LIMITED.

Are prepared to receive TENDERS for the following WORKS to be done at the Vulcan Iron Works, Derby.

CONTRACT NO. 1.—For the Supply and Erection of Wrought Iron Roof to Extension of Annealing House, containing about 9 tons of Steel in girders, 35 tons of Wrought Iron in roof, and 10 tons of Cast Iron in columns, gutters, &c.

CONTRACT NO. 2.—For the Supply only of about 7½ tons of Cast Iron in Columns, and 6½ tons of Steel in Rolled Girders.

CONTRACT NO. 3.—For the Builder's Work required in the Alteration and Extension of Grindery.

CONTRACT NO. 4.—For the Building Work required in the Extension of Annealing House.

The specifications and drawings may be seen, and quantities obtained, on application to Mr. E. R. RIDGWAY, Architect, Long Eaton, near Nottingham, on payment of One Guinea for Contracts Nos. 1 and 2, and One Guinea for Contracts Nos. 3 and 4, which sums will be returned on receipt of bona-fide Tender.

The Advertisers do not bind themselves to accept the lowest or any Tender.

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly prepares Candidates for the above EXAMINATIONS by Correspondence. No books are required.—For particulars and testimonials apply "Certified Coach," 31, Herbert-road, Plumstead, S.E.

Price 3s. 6d.

**GLOSSARY OF TECHNICAL TERMS** used in Architecture and the Building Trades. By GAVIN JAMES BURNS, B.Sc., F.S.I.

Contains explanations of over 2000 terms.  
London: E. and F. N. SPON, 125, Strand.

**CIVIL SERVICE TECHNICAL EXAMS.**—Preparation personally or by correspondence. Residence can be arranged if desired. Full particulars on application to Mr. A. H. HENTY, Perchard House, 70, Gower-street, W.C.

**R.I.B.A. EXAMS. PREPARATION** personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library, Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

**MASON'S PATENT** Used on the New TOWER BRIDGE.

**UNWEARABLE, NON-SLIPPING STAIR TREADS.**

Non-Slipping Sideway Entrance Covers, Hydrant, Manhole, Inspection, and other Covers, Coal Plates, &c.

Contractors to H.M. War Office and the Admiralty.

**THE SAFETY TREAD SYNDICATE, LTD.,** 15, Barbican, London, E.C.

### APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

### THE LONDON (TELEPHONE { Holborn, } No. 1011.) DRAWING & TRACING OFFICE,

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

(Continued from page xlvii.)

BY ALEXANDER DREW.

NO. IV. OF SERIES.

BUT it is not sufficient to compare only the cost of the trusses, for each of these, even when all are equally spaced, requires a different area of covering; and it is necessary to take the cost of this into account in each case before a true comparison can be made. Thus this last table (e) gives the areas of covering required, which vary from 48½ sq. yards to 42½ sq. yards for the two extreme rises noted. The cost of slates and boarding has been assumed as 7s. per sq. yard, while that of corrugated sheets and iron purlins complete has been taken at 5s. per sq. yard, and the respective total costs for the various areas have been extended out. The two last lines on this table are got by adding the value of one truss and that of the area for one bay of the two different coverings together; and these total values on comparison bring out very conclusively the well-known practical fact that the medium rises of about one-fourth or one-fifth of the span, in the majority of cases, form the cheaper roofs. Such a complete investigation as this is very instructive, and shows how carefully the whole facts must be considered before an accurate conclusion can be drawn; the cost of the truss increases from £4 6s. for one-third rise, to £5 19s. for one-sixth, while the cost of covering per bay falls. Neither of these in themselves are of any real use as comparisons, but the addition of truss and covering immediately emphasises the fact just noted.

This table will also bring out the desirability of keeping the main ties as low as possible, for any unnecessary raising of these, by reducing the angle at the shoe, increases the stress on the several bars, and necessarily raises the cost of the truss; here no advantage due to alteration in cost of covering can be got, and consequently increased cost and less efficiency is the result.

The types which the various roof trusses may assume are almost unlimited in number, but a few of the more common forms are outlined in Fig. 26, and the following brief mention of each must for the present suffice. For small simple spans No. 1 is that usually adopted; but as the span increases, so does the length of each rafter, and the necessity for some means of stiffening or strengthening this latter soon arises; such is done in Nos. 2 and 3 by introducing a strut on either side to support the rafter in the centre of its length. Where the rise is small the outline No. 2 will probably prove most suitable, the struts being

here short and set at right angles to the rafter; should the rise, however, be considerable, it is likely that No. 3 would be found an improvement, for though the struts are longer and not set at so efficient an angle, they are yet in a fairly satisfactory position, and the saving due to one king rod replacing two queen rods will undoubtedly assist in keeping down the cost of this type; it is sometimes necessary to introduce two light rods, called suspenders, to carry the long length of main tie. With a further increase in the span the necessity for a greater number of supports to the rafter arises, and

support points, but it has not been thought necessary to draw these. No. 6 shows a type very suitable for wide spans, particularly such as have a fair rise; it is usually called a "French" truss: the diagram shown underneath this will be returned to presently. No. 7 shows a more or less ornamental type of truss, in which the upright members are formed as struts, the diagonals being generally of flat iron; at the intersection of these latter it is very usual to fix some cast iron ornamentation to add to the appearance. Such a type as this is very suitable where the space to be covered in is slightly

Nos. 4 and 5 show types of a similar nature to those of Nos. 2 and 3, but with two intermediate support points to each rafter. In the same way these types might be further extended to give three or four intermediate

tapering, that is to say, where it is slightly wider at the one end than the other, for the centre bay may be to a considerable extent altered in width to allow for this tapering (the ventilator, of course, being kept to the

\* A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the Builders' Journal.

width of the centre bay), and thus the side slopes remain uniform throughout. No. 8 shows a type very similar to that of No. 2, except that the rafters are not straight in this case—such is often called a "Mansard" roof. A usual practice with this truss is to cover the two upper slopes with sheeting or slates, while the lower and steeper slopes are filled in with windows, thus securing a considerable amount of light to the building below. No. 9 shows another type supplied with large ventilator, and specially suitable where considerable ventilation is desired, the large space in roof allowing the foul air to collect and quickly find its way out. No. 10 indicates a form of truss much used in spinning and weaving sheds, where a large amount of light, but not sunlight, must find its way into the building; the flat slope is clad with sheets or slates, while the short steep slope is filled in with glass, and this latter is turned always towards the north. Such a type of roof is often called a "Northern Light" roof, or, from its appearance when seen as a series of spans, it is sometimes called a "Saw-tooth" roof. The span for such a type seldom exceeds 20ft., or at most 25ft., and where necessary the single strut may be replaced by double struts, as indicated by dotted lines, so that the long rafter may be further stiffened. No. 11 shows a simple form of overhang or bracketed roof.

Returning to No. 6, it may be noted that the members 5 6 and 8 9 are not placed symmetrical with the others, but are inclined so as to come under the supports of the ventilator. There is also marked on this outline a series of assumed dead loads, these being also taken irregularly for the purpose of emphasising a little difficulty which is likely to arise in drawing a stress diagram for such a condition. The diagram only represents one half of the complete dead load stress diagram, which is drawn in exactly the manner previously described. When the joint at foot of member 3 4 is reached, a difficulty will be experienced in determining the point 4 on the stress diagram, the irregular loading, &c., giving rise to this trouble. A simple expedient, however, will get one out of this trouble, for the lines from E and F can be drawn parallel with the rafter E 5 and F 6, and any point chosen in one of these lines from which a line may be drawn parallel to the member 5 6, and from the points 5' 6' two lines are drawn parallel to 5 4 and to 6 7. The point of intersection of this will indicate the relative position of the required point 4, so that a light line drawn from this point of intersection parallel with E 5 till it intersects the line 3 4 will give the real point 4, and no difficulty need now be experienced in completing the diagram. Should a diagram be attempted for No. 7, it must be borne in mind that in the case where the diagonal members are formed of round rods or of flat bars these cannot to any practical extent act as struts, and it is necessary to draw the diagram in such a way that they shall only be subjected to tension. It will also be found in doing this that only one of these diagonals in each bay is active, or in use, the other being what is called a redundant member, or a member which is superfluous under that condition of loading.

Referring again to No. 7, there is here shown the usual manner in which the wind pressure is allowed for in the case of a large ventilator. Considering the ventilator alone, the resultant of the normal pressure on the windward slope is combined with the resultant of the pressure on the vertical side next the wind, by making use of the principle of the parallelogram of forces previously described, and this resultant is produced till it intersects the rafter at the point marked X. It is only necessary then to neglect altogether (as far as wind stress is concerned) the ventilator, substituting for it this single force, inclined as shown, and acting at the point X. With the dead load, no trouble need arise, as the total load would simply be divided equally between the two supports.

Returning once more to outline No. 6, two curved dotted lines, marked X X and Y Y, are drawn to illustrate what has been previously noted, that the imaginary section lines used with the Method of Moments do not necessarily require to be straight. If such a truss as this be gone

over systematically by this Method of Moments, the stress in the members C 1, D 2, 1 2, A 1, A 3, or 2 3, are readily determined by taking successive straight line sections in the manner shown at Figs. 19 to 22; but when strut 3 4 is arrived at, it will be found that no section line, whether straight or curved, can be used without leaving too many unknown forces to be determined. Such being the case it is necessary to pass this member for the time being, and take the curved section line X X, with the turning point at the apex of the rafters; in this way we are enabled to get rid of the stress in all the members cut by that section line which meet at this point, leaving the tie 4 5, whose stress can be readily calculated. Having done this we may return to the strut 3 4, and by taking the straight section line Z Z, and the turning point at the left hand shoe, can then calculate readily the stress on this latter member now that 4 5 has been determined. The stress on member 5 6 is got at by taking the second curved section line Y Y, and the turning point at apex of rafters, as before. No trouble need arise with any of the other members, and it is well to note that in very few cases need much difficulty be experienced that cannot be overcome by a means such as here shown, of passing over for a time the difficult point, and returning thereto afterwards.

Thus far the assumption has been that all the external loads are applied at the joints or intersections of the various members with one another, but it frequently occurs that this is not the case, as where the purlins are spaced so that they rest on the rafters at some intermediate positions. When this is so, the first consideration is to refer these intermediate loads to the joint; that is to say, each intermediate load must, for purposes of calculation, be first replaced by equivalent loads placed at the joint on each side of it. A reference to Fig. 14 will show how such a single force has to be proportioned between the two joints, the total load being divided on the inverse proportion of its distance from the two joints. All loads being thus referred to the joints, the Graphic Method, or that of the Method of Moments, may be used to calculate the stress on the several members, and thus far all would be gone about as has already been described. It may be here noted that, strictly speaking, the dead load of the truss itself ought to be proportioned over all the joints, instead of over the joints at the rafters only; but such theoretical refinements are never indulged in in practice, the possible error being very small under any circumstance. Should the truss be used to support a ceiling, or some other loading be applied to the main tie, this, of course, must be considered as acting at the lower joints in the framework; but no real trouble or difficulty need arise in calculating the stresses on this account.

At a recent meeting of the St. Helens Town Council the Gas and Lighting Committee recommended that the sum of £25,000 be spent in extension of the gas works, and it was stated that the present total producing capacity of the works was 1,280,000 cubic feet, while on the day before last Christmas the consumption of gas actually reached 1,352,000 cubic feet. Statistics were given showing that the annual consumption of gas had increased from 111,800,000 cubic feet in 1880 to 256,022,000 cubic feet last year, and the proposed extensions would increase the producing capacity of the works by 750,000 cubic feet per day. It was estimated that the extensions would meet all requirements for the next ten years, and when they had been made the whole of the land available on the present site would be utilised, and there would be no room for further extensions. Additional storage accommodation would soon have to be asked for, as the present holders only had a capacity for 1,700,000 cubic feet, just a little over the average daily consumption of gas during the past year. The growing increase in the consumption of gas is attributed to the introduction of prepayment meters, whereby a large number of cottagers are using gas, and to the discontinuance of rent for meters and stoves.

## THE CLASSIC CORNICE.\*

By HUGH H. STANNUS.

IN a few introductory remarks Mr. Stannus paid a tribute to the President of the Association, and, passing on to deal with the subject of the classic cornice in a very discursive and informal manner—after announcing his intention to confine his remarks to profiling, to the exclusion of all considerations of the enrichment or the history of the cornice—he spoke of the functions of a moulding, and showed how a collection of mouldings forming a cornice should be placed together according to certain principles. The cornice had constructive functions to fulfil, but it had also aesthetic value. When they looked at a moulding they saw a number of pleasant parallel lines, and, in order to appreciate and produce beauty of curvature, Mr. Stannus subsequently recommended students to study the nude. He proceeded to explain the convex and the ogee kinds of cornices and, with frequent—almost constant—reference to diagrams, to analyse the construction and the beauty of the various forms, and to explain how and why they were beautiful, and the principles underlying their beauty. It was emphasised that mouldings forming a group should be confluent, but the groups making a cornice should not be confluent. The special functions of the groups were explained, and

### SIMPLE CURVATURE

recommended to students in preference to treble curvature, which, Mr. Stannus said, was always a premonitory symptom of decay. The question of phrasing was dealt with, the equality of size was deprecated, and, in concluding, Mr. Stannus said they must not forget that no moulding could exist merely to itself, and to make a perfect cornice each group had to be a perfect member of the coalition.—The President (Mr. Beresford Pite), in opening the discussion, said it was very interesting to have an address from a man who had made himself master of the subject he dealt with, delivered in the informal manner Mr. Stannus had adopted; it was so welcome after the laboriously-prepared papers they read when honoured with an invitation to address the Association. Now, this was a practical subject, and a subject which every one of them who had to design found difficulty in sooner or later. The moulding was the measure of the man. Street used to speak of it as "the Art and Science of moulding." They could always tell an Architect's capacity as well as the habits of his mind—whether industrious, patient, careful, intellectual—by his mouldings. "As a rule, your client did not interfere with your mouldings; he did not pay you for them. In many cases he would prefer

### THE TRADE STOCK PATTERN;

but the world would read the Architect, not in the trade stock pattern, but in his mouldings. Now, he supposed that a great many of them who had to design mouldings—even if they started with bedroom cornices at six or nine inches girth—had never dreamt for a moment of anything like the philosophy and science, to say nothing of the system of analysis which Mr. Stannus had revealed, being associated with cornices. They were scarcely in a position to proceed on an analytical basis; they had to do what laid at their hands. With Alfred Stevens, aided by Divine gifts, his sense of beauty acted more rapidly than his analytical sense, and he evolved beautiful cornices with an easy certainty of hand and mind which

\* Delivered before the Architectural Association on Friday night.

We hope soon to publish a series of articles on this subject by Mr. Stannus, together with illustrations and diagrams, without which the greater part of the author's remarks on Friday night would be unintelligible, as they partook more of an explanatory and analytical nature than of a running commentary, as is the usual order of the papers read before the Architectural Association. In view of the publication of this series of articles, which will deal very much more extensively with the subject than Mr. Stannus did in his recent remarks, we now merely publish a very brief summary of a few of the points raised at the Association meeting in order to incorporate some interesting remarks made by Mr. Beresford Pite and other members.—Ed.

marked him as a genius. Whether they, after studying the principles underlying the beauty of Stevens's work, could produce anything of the sort was a problem he would not care to solve. They could certainly get at the root of its beauty, but whether an examination of the root would allow them to grow a similar plant in their own intellect was an open question. What would Mr. Stannus suggest as a course of study to train the eye and the mind to produce beautiful cornices? Mr. Stannus had been extremely interesting and instructive in his remarks, yet he had not laid down any definite lines for the student's guidance in studying the subject. Mr. Stannus also had not given expression to what he must feel—the importance of a free-hand feeling in a cornice. Mr. Street had emphasised the desirability of freedom rather than mathematics and geometry in cornices, and he thought no better advice could be given the every-day student than to

#### THROW AWAY HIS COMPASSES,

and trust to his hand. With regard to the cultivation of a proper sense of beauty, there was only one perennial font—the curves of the human figure. When they began to study these curves—and every Architect should have some knowledge of anatomical drawings—they soon realised that there was an infinity of beauty of composition, and that the lines of every feature of the human frame in every single part of the outline had a subtle beauty which was absolutely indefinable. They could not make or copy that beauty with an instrument; they were bound to do it with their hands. Now, they might get naked models and look at them all night and yet fail to discern the beautiful, and if they passed from the Greek to the Roman revival they began to see what Mr. Stannus had called the debased sensuous element. They would find something in Michael Angelo's work, which Stevens could not excel—the expression of his square lines, and the power and delicacy of his curves. He had no doubt that Mr. Stannus's remarks would lead them to see that there was a vast amount of interest and meaning associated with the question of cornices, and for his masterly interpretation of the subject—or part of it—they could only return their warmest thanks.—Mr. C. H. Brodie, in a few words, proposed a vote of thanks to Mr. Stannus, and, in seconding it, Mr. Banister F. Fletcher said Mr. Stannus had given them a discourse on the principles which should guide them in designing cornices, and, although they might have previously had some idea of those principles, yet one got into the habit of doing these things merely by what one had seen before. He agreed as to the value to Architects of drawing from the nude; until they had gone through such a course of tuition they had really no idea of the

#### BEAUTY AND VALUE OF CURVES.

He would strongly advise all students to draw from the nude, and, in doing so, not to make laboured studies, but rather rapid studies and plenty of them. He hoped Mr. Stannus could be prevailed upon at some future time to treat Gothic mouldings, which would, he thought, form an equally interesting paper, and it would also be a matter of satisfaction if he would publish *in extenso* his MSS. on the subject of the classic cornice.—Mr. Hampden W. Pratt said Mr. Stannus's remarks made them hunger for a little more, and it would be very interesting and instructive if he could also be prevailed upon to treat the subject of enrichments. Such a paper would, he thought, be more welcome than one which branched off into Gothic styles. He would like to ask Mr. Stannus whether he considered it desirable in designing external cornices to design in profile as seen on the angle. He should say that the custom was to design them on the square and trust to one's experience as to producing a satisfactory effect when seen diagonally. One often noticed that Architects in designing cornices merely considered the effect it had upon the angle. Take the chimney cap, for instance, which was a kind of cornice. He thought they were invariably a great deal too heavy, and not in proportion to the chimney stack.

He was glad the question of the freehand method of drawing mouldings had been referred to. The eye and the hand could alone produce

#### PERFECT FORMS OF MOULDINGS,

and it was absurd to see anyone attempting to draw the forms with compasses.—The vote of thanks was carried with acclamation, and, in replying, Mr. Stannus disabused the idea that Mr. Stevens produced his drawings of profiles with easy certainty. Some of his sketches had been redrawn four or five times, and in one case a detail had been repeated 150 times before finally determined. Someone had said that all inventions were mere accidents, and Mr. Baker had replied, "Yes, well, they are—but some people have more accidents than others." Profiles had to be tried over and over again, and it was not until after a long series of experiments had been tried that they found out what were the most successful. Now, as to what was the best course of study, the royal road to designing mouldings—well, there was no royal road. It was a matter of brain worry. They must look at the best things, surround themselves with the best things, get every bit of Stevens' and thirteenth century work they could find. All Art was one, and all Artists had the same mind. As to free-hand drawing, he had always advised students to discard their compasses and tee-squares, and draw their mouldings entirely by hand. Street did it, Barry did it, Scott did it, and John Sedding believed that an Architect should even draw tracery by hand, and they had instances where this had been done. He (the speaker) thought that Architects ought to do more and more of the artistic side of their designing by freehand. He believed that the Greeks drew freehand, but did not agree with Penrose that the drawings were afterwards repeated with the compass. It was the training of the eye, in addition to the study of the nude form, that led the Greeks to make the beautiful curvature admired so much to-day. They could not emphasise too much the desirability of drawing from the human figure, for if they could draw the human figure they could draw anything in Gothic mouldings. More freehand, more brains, and less of compasses was the best "tip" he could give to students.

THE Health Committee of the Liverpool Corporation has given their approval to a report of the city engineer, requesting authority to carry out the work of providing additional cells, &c., at the refuge destructor in Smithdown Road, at a cost of £2500.

MR. CHARLES P. COTTON, Chief Engineering Inspector of the Local Government Board, has held an inquiry at Bangor into an application of the Local Authority for a loan to carry out the proposed sewerage extension of the township. The amount of the loan required is £3493, and the application was to give some branch sewers to the main sewer at present existing, and to make a main along to the Foley Bridge down to the outlet.

MR. R. HASSARD, C.E., has prepared a report on the proposed extension of the Dundalk Waterworks. These works were constructed in 1884, at a cost of about £40,000, and, though now yielding an average daily supply of 750,000 gallons, Mr. Hassard stated that from his examination he believed that a very great quantity of water—possibly as much as 300,000 gallons per day—is lost owing to either defective fittings or wilful carelessness on the part of consumers. The amount of water left to be accounted for by domestic consumption is about 42 gallons per head of the population daily, as against 20 gallons, which should be ample. Mr. Hassard warned the Commissioners that if this continued, a long period of drought would result in a water famine. This danger could be to some extent averted by adding to the capacity of the large storage reservoir; and if deemed desirable a separate main could be laid to the town to supply the manufacturing consumers at a cost of £3500. But the Commissioners should first endeavour to reduce the consumption to a proper level by rigid inspection of all fittings, and by requiring consumers to put up storage cisterns.

## Surveying and Sanitary Notes.

THE Nottingham borough engineer has reported on the condition of a syphon which carries the main Leen sewer under the Nottingham Canal at what is known as the Cork Hole, near Island Street. The syphon is a single one with a diameter of about 8ft., and it was put down in 1795, when the canal was constructed. The area of the Leen sewer is 52ft., and the area of the syphon is about 30ft. The syphon is, therefore, not more than three-fifths the size of the sewer, and quick bends still further reduce the discharging capacity of the syphon. Besides this, the working area of the syphon is very much reduced, as it is silted up to a very great extent. It is proposed to take out the present sewer and to replace it with an iron syphon in duplicate, each syphon being 6ft. in diameter, with ample space at each end for inspection and cleaning when required. The borough engineer estimates the cost of the work proposed at from £1800 to £2000.

UNDER pressure of the County Council, the Hamilton burgh authorities employed Mr. W. E. Copland, C.E., Glasgow, to report as to the disposal of the sewage, with a view to purification, and he has just forwarded to the Sanitary Committee an elaborate report. He sets out with the statement that of necessity the scheme which he suggests will involve a large amount of outlay, but otherwise does not present any difficulty. The ground which he has selected for the sewage disposal works is the portion of Bothwellhaugh immediately to the south of Raith farm steading. In order to reach this ground it will be necessary to carry the sewage across the river either by means of syphon or an aqueduct, and he would prefer the latter method. For the purification of the sewage he recommends the lime and alumina method, which has been in successful operation in the East End of Glasgow for the last three years. He estimates the cost of the work at £25,000, and their annual upkeep at £2008, which, at the present assessable rental, would be covered by an assessment of about 5½d. per £1.

DR. ALEXANDER WYNTER BLYTH, Medical Officer of Health for St. Marylebone, in his annual report to the vestry, gives a report of the work done by the Sanitary Department. There were no less than 1065 complaints received and attended to during the year. There were 1658 inspections of dwelling houses, and 613 kitchens, 98 schools, and 1154 houses registered under the Public Health (London) Act, 1891, were inspected. Then there were 114 inspections of dairies and cow-houses, 485 of bakehouses, and 95 of slaughter-houses, and 9150 miscellaneous inspections were made.

THE sanitary condition of Foleshill, and more especially the trouble caused in disposing of the sewage, has long engaged the attention of the Rural District Council. A report has been prepared by Mr. H. B. Nichols, Corporation Street, Birmingham, in which he says the activity of the Coventry cycle industry causes an overflow of population into Foleshill, and extensive building operations are probable in the future. The sewage scheme deals with a population of 15,000, but certain parts can hereafter be enlarged, so as to meet the needs of three times that number of people. He proposes a site for outfall works, where tanks would be erected and precipitants used. The cost of carrying out the works is estimated at £24,019, exclusive of land, which is put at £6000 additional.

At a special meeting of the Bath Surveying Committee, the pitching and paving estimates for the year were considered. The total was £1000 less than last year, the surveyor saying he had recommended as little as possible, as the streets would be pulled about by the relaying of the electric light mains. It was decided not to repitch the Royal Crescent roadway, but to lay down tar macadam, and thus save £400.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
May 7	East Ashford, Kent—Alterations to Infirmary Chapel, &c.	Guardians	Workhouse, Willesboro'.
" 7	Banstead—Enlargement of Schoolrooms	Chelsea and Kensington School District	Cecil Sharp, 59, Fenchurch-street, E.C.
" 7	Mallow—Erection of Piers and Gates	Guardians of Mallow Union	Board Room, Workhouse, Mallow.
" 7	Morley—New House	S. Sharp	George B. Clegg, 2, Peel-street, Morley.
" 7	New Tredegar, Mon.—Alterations, 105 and 106, Commercial-street.	Mrs. Thomas	H. Sketch, Architect, New Tredegar.
" 7	Manchester—Brickwork for Straining Well	Corporation	Secretary, Waterworks Office, Manchester.
" 8	Elgin—New Houses	James Scott	J. Jamieson, 2, Commerce-street, Elgin.
" 8	Lancaster—Erection of School	School Board	Clerk to the School Board, Lancaster.
" 8	Blackburn—Erection of Laundry, Workhouse	Guardians	J. Aspinall, Victoria-street, Blackburn.
" 8	Dolphinholme, near Lancaster—Rebuilding Church		Wright and Son, Surveyors, Lancaster.
" 8	Drumquin, Ireland—New Platform Pulpit	Presbyterian Church	Rev. D. Marshall, Drumquin.
" 8	Edinburgh—Additions to Morningside Public School	School Board	Mr. Wilson's Office, 3, Queen-street, Edinburgh.
" 8	Templepatrick, co. Antrim—Erection of Manse		Samuel P. Close, 53, Waring-street, Belfast.
" 8	Keld—Extension of Schoolroom		Rev. W. Crombie, Keld.
" 10	London, N.W.—Asylum	Central London Sick Asylum Board	Giles, Gough, and Trollope, 28, Craven-street, Strand.
" 10	London, W.—Temporary Iron Structure	Asylums Committee of the L.C.C.	Clerk of the Committee, 21, Whitehall-place, S.W.
" 10	Barry Dock, Wales—Erection of Chapel, &c.	Baptist Church	25, Regent-street, Barry Dock.
" 10	Halifax—House, Shop, &c., King's Cross	H. Ashman and Co.	Jackson and Fox, 22, George-street, Halifax.
" 10	Bristol—Enlargement of Premises	Polkinghorne and Co.	J. Hart, Liverpool-chambers, Corn-street, Bristol.
" 10	Plymouth—Erection of Covered Market	Corporation	G. Adam and Sons, Engineers, Bristol.
" 10	Preston—Repairing Bridges	County Council	Architect's Offices, 8, Princess-square, Plymouth.
" 10	Westcliff-on-Sea—Alterations to Hotel	J. J. Wagstaff	W. Radford, 19, Brazenose-street, Manchester.
" 10	Hartlepool—Public Hall and Offices	Concert and Lecture Hall Company	J. Thompson and Greenhalgh, Bank-chambers, Southend.
" 11	Hartlepool—Converting Coastguard Dwellings, &c.	Works Department	R. M. McDowall, Architect, Castleford.
" 11	London, S.E.—Conveniences	London County Council	R.N.R. Battery, West Hartlepool.
" 11	Baildon, Yorks.—Erection of Residence		Architect's Department, County Hall, Spring-gardens, S.W.
" 11	Billerica—Flooring, &c.	Guardians	Fairbank and Wall, Craven Bank-chambers, Bradford.
" 11	Dowlais, Wales—Building Thirty-five Cottages	Penywyn Building Club	Master of the Union House, Billericay.
" 12	Halifax—Erection of Stables, &c.	Urban District Council	8, High-street, Cardiff.
" 12	Ryton—Widening Stargate-lane	Urban District Council	Surveyor, High-street, Gosport.
" 12	Lynton, N.W.—Works for Infirmary	St. Pancras Guardians	Chas. F. L. Horsfall and Son, Lord-st.-chambers, Halifax.
" 14	Rotherham—Erection of Swimming Bath	Baths Committee	J. P. Dalton, Council Surveyor, Ryton.
" 15	Harting—Enlargement of Schools	School Committee	A. A. Millward, Vestry Hall, Pancras-road, N.W.
" 15	Bridgend, Glamorgan—New Stage, &c.	Committee of the Town Hall Trust	Town Clerk's Office, Howard-street, Rotherham.
" 15	Clayton-le-Moors, Lancs.—Erection of Thirteen Houses	Co-operative Society	C. Taylor, South Harting.
" 17	Cardiff—Erection of Library	Corporation	Lambert and Rees, Architects, Bridgend.
" 17	Farnham—Infirmary	School Board	Co-operative Society, Clayton-le-Moors.
" 17	Trowbridge—Recreation Rooms at Asylum	Wilts County Asylum Governors	W. H. Dashwood Caple, 1, St. John's-square, Cardiff.
" 18	Bucharest—Industrial School, Jassy		A. Ansell, 63, Finsbury-pavement, E.C.
" 18	Buenos Ayres—New Central Railway Station	London County Council	County Offices, Trowbridge.
" 18	Rockley—Public Convenience	School Board	Roumanian Ministry of Agriculture, Bucharest.
" 18	Grays Thurrock—Erecting Portion of School	Corporation	State Government, Buenos Ayres.
" 19	Middleton—Raising Roof of Retort House	Guardians of St. Olave's Union	Architect's Department, Spring Gardens, S.W.
" 20	London, S.E.—Erecting Laundry, Repairing, &c.	Corporation	C. M. Shiner, 2, Walbrook, E.C.
" 25	Brighouse—Erection of Press-house, Chimney Shaft, &c.	Guardians	T. Duxbury, Gas Manager, Middleton.
" 27	Prestwich—Erection of Vagrant Wards	Leys Malleable Casting Co. Limited	Newman and Newman, 31, Tooley-street, S.E.
No date.	Long Eaton—Alterations of Grindery, Extension of House		A. M. Fowler, 1, St. Peter's-square, Manchester.
"	Smeeth—Salop—Additions to National Schools		W. Telford, Gunson, & Son, 10, Marsden-street, Manchester.
"	Acharacle, near Oban, N.B.—Manse		E. E. Ridgway, Long Eaton, Notts.
"	Leeds—Two Houses, Kelso-road		A. B. & W. Scott-Deakin, Architects, Pride Hill, Shrewsbury.
"	Beeston, Notts—Pair Villas		W. Mackenzie, Architect, 42, Stevenson-street, Oban.
"	Burnley—Shops, Yorkshire-street, &c.		W. S. Braithwaite, 6, South-parade, Leeds.
"	Leenside—Technical School	Nottingham School Board	J. Huckerby, Surveyor, 8, The City, Beeston.
"			C. Parsons, Architect, 9, Grimshaw-street, Burnley.
"			A. H. Goodall, Market-street, Leenside.
<b>ENGINEERING—</b>			
May 7	Buckie, Scotland—Water and Drainage Pipes	Police Commissioners	J. Chisholm, Burgh Surveyor, Buckie.
" 7	Rother, Scotland—Precipitation Tanks, &c.	Rural District Council	Louis Harper, 115, Union-street, Aberdeen.
" 7	Doncaster—Cast-iron Pipes, Thurnscoe	Guardians	W. Spinks, 31, Prudential-buildings, Leeds.
" 8	Omagh, Ireland—Cooking and Laundry Appliances	Urban District Council	W. Cathcart, Clerk, Workhouse, Omagh.
" 8	Radcliffe, Lancs.—Sewage Disposal Works	Gas Corporation	Surveyor, Council Offices, Radcliffe.
" 10	Arbroath, Scotland—Erection of Gasholder	London County Council	R. S. Carlow, Gasworks, Arbroath.
" 10	London—Iron Structures at Asylum		The Clerk, 21, Whitehall-place, S.W.
" 10	Catania, Sicily—Harbour Works		Italian Ministry of Public Works, Rome.
" 11	Castlebar, Ireland—Cooking Appliances	District Asylum	Asylum, Castlebar.
" 11	Congleton—Waterworks	Rural District Council	Wyatt, Bryndwr, All Saints, Shrewsbury.
" 13	Manorhamilton, Ireland—Waterworks	Guardians	R. H. Dorman, County Surveyor, Armagh.
" 14	Carlrow, Ireland—Supplying and Fitting Range	District Lunatic Asylum	Clerk's Office, Carlrow.
" 15	Clitheroe—Supply and Erection of two Purifiers	Gas Committee	R. Barrett, Manager, Gasworks, Clitheroe.
" 15	Dartmouth—Construction of two Flushing Tanks	Urban District Council	T. O. Veale, Surveyor, Dartmouth.
" 17	Hinckley—Gas Apparatus	Urban District Council	Geo. Helps, Gasworks, Hinckley.

### Arts and Crafts at Wolverhampton.

PERHAPS no aspect of the artistic revival in which we live is more full of encouragement than the interest which the provinces show in that side of the movement known as "Arts and Crafts." An Exhibition under this title was recently opened in Wolverhampton which is of considerable importance. Its success is largely due to the help of the Arts and Crafts Exhibition Society, which not only used its influence to induce artists to contribute, but appointed Mr. C. R. Ashbee and Mr. H. Wilson to assist Mr. L. W. Hodson, the representative of the local Committee, to arrange the Exhibition. Two downstairs rooms in the Art Gallery contain the exhibits, the smaller room, about 31ft. by 18ft., being mainly occupied by the work of William Morris and furniture by Mr. Ashbee. The principal attraction in this room is the exhibition of Morris tapestry. In the centre of the long wall is the "Primavera" of Botticelli, flanked by "Angeli Laudantes" and "Angeli Ministrantes," by Sir Edward Burne-Jones, and we question whether these tapestries have ever been better shown. Above them are casts of the Parthenon frieze, which are permanently fixed to the wall, and the bottom of the tapestry is within 2ft. of the floor. This arrangement, of tapestry below a frieze is the one that Morris himself advocated, and certainly the effect goes far to endorse his judgment. The windows are opposite the tapestry, so that the disadvantage of either a top or raking light is avoided. Among other exhibits are the Apple-Tree portière embroidered by Mrs. Sparling from her father's design, specimens of Hammersmith rugs, woollen woven fabrics, cretonnes, and in cases under the windows an almost complete set of the Kelmscott books, lent by Mr. Hodson, including the Chaucer, Jason, illustrated Glittering Plain, and several others on vellum, and the rest on paper. Mr. Ashbee's furniture includes a sideboard of oak inlaid with pewter, a writing-table with hammered copper ornaments, two cabinets, and a grandfather's clock. Besides the Kelmscott books the Exhibition includes a complete set of the books published by Chas. Ricketts, as well as the wood-blocks of the Milton and "Passionate Pilgrim," title-pages designed and etched by Wm. Strang, a number of Walter Crane books, and a few others. Another important feature is the collection of original drawings in which the work of Sir E. Burne-Jones is splendidly represented by the entire set of the twenty-nine Virgil drawings executed in 1873-74 for an illuminated manuscript planned by the Artist and Wm. Morris, which are lent by Mr. Hodson, and by ten of the Chaucer drawings for the "Legend of Fair Women," lent by the Artist. The contrast between these two sets is most interesting, yet, great as the change has been during twenty years, it is hard to say which set is the more delightful. There are also charming examples of the Artist's new method of painting in metal. A long series of the "Fairy Queen" drawings by Walter Crane, two exquisite designs for "The Sphinx" by Chas. Ricketts, drawings by Anning Bell, Aubrey Beardsley, A. J. Gaskin, Laurence Houseman, Walter West, Mrs. Gaskin, and others, are practically an epitome of all that is best in modern decorative book illustration. Be-

sides the furniture previously referred to, Mr. Ashbee is represented by a beautiful exhibit of his metal work and jewellery; by an architectural drawing of great interest, showing the alterations he is now making to Wombourne Wodehouse, near Wolverhampton; and, most interesting of all, by a mural sundial painted on copper, which ere long will adorn one of its gables. Mr. H. Wilson is represented by six drawings—three in pastel, one in water colour, and two in black and white—two showing designs for church interiors, another a formal garden at Welbeck Abbey, and the water-colour a garden seat, full of subtle charm partly gained from his master, John Sedding, and still more personal to himself. The Birmingham Guild of Handicraft send a very good show of jewellery and metal work. Nelson and Edith Dawson are represented by the casket which gained so much praise at the Academy of 1895, and the dish in beaten silver and enamel which graced the New

by the Office, but the Earl of Radnor would not agree to sell the freehold, and consequently the Commissioners came to Parliament for compulsory powers of purchase. The Bill was referred to a Committee in the usual way, before which any opposing petitioner had an opportunity of being heard, but at the meeting of this Committee on Friday it transpired that no such memorial had been lodged, and that the Bill was unopposed. Formal evidence was then given by Mr. Webb, one of the principal clerks in the Patent Office, who is well aware of its requirements, that it is in very great need of extension, and that the natural site for the purpose is these two houses, which in point of fact are encompassed by the Office on three sides. The Bill then passed through Committee.—The other measure is the much larger one—for the acquisition of the Carrington House site with a view to the erection thereon of buildings for the War Office. The site in question is bounded by Whitehall, Whitehall Place, Horse Guards' Avenue, and Whitehall Court,

ENAMEL BY ALEXANDER FISHER.

AT THE ROYAL ACADEMY.

Gallery last year. Alexander Fisher sends a most beautiful casket in ivory and enamel. Powells show a case of blown glass, De Morgan a case of pottery, Geo. Jack a fireplace, Lethaby firedogs and candlesticks, Cobden Sanderson a very beautiful book-binding, Zaehnsdorf three specimens of his work, Miss McColl two and photos of others; and various wall-papers, stencils, Fitzroy pictures, &c., help to complete the show. We heartily congratulate the Wolverhampton Committee on an admirable Exhibition, and we trust it will command the measure of success it deserves.

### Bills in Parliament.

Two Government Bills, to the provisions of which attention has been drawn in these columns, are now almost as good as law. One of them enables H.M. Office of Works to compulsorily purchase two houses—Nos. 27 and 28, Southampton Buildings—for an extension of the Patent Office. The leasehold interests in the property in question had been acquired

and the freehold is part of the property of the Commissioners of Woods and Forests so that its transfer to the Office of Works, though requiring Parliamentary sanction, is a matter of easily settled terms. Two petitions against the Bill had been presented, one from the vestry of St. Martin-in-the-Fields, and the other from the London County Council, but in course of last week the first was withdrawn, and when the Committee on the Bill met on Friday it transpired that terms had been arranged with the latter body. The first point was in regard to a sewer, the property of the Council, which passes under the site, and which it is proposed to divert. It was arranged that the County Council should, on being so required, construct the new diverting sewer at the expense of the Office of Works. The other point had reference to an inclusion in the Bill not only of the site but also of the site of the footway in Whitehall Place and Whitehall; but, as to this, Mr. John Taylor, C.B., principal Surveyor to the Office of Works, made it clear that there is no intention of permanently appropriating or building over the footway, or encroaching upon the old line of frontage. Some amendments

embodying the arrangement as to the sewer arrived at with the County Council were made in the Bill, which later in the day was duly reported to the House.—Mr. Knowles, M.P. for West Salford, may reasonably congratulate himself on the progress made with the Bill for the national registration of plumbers, which for some years he has endeavoured to place on the Statute Book. According to an official memorandum, "the chief object of this Bill is to afford additional safeguards to the public health by enabling persons employing plumbers to select, when they desire to do so, persons who have given evidence of their qualification for plumbers' work. There has been for several years a system of registration of plumbers established in the chief centres of Great Britain and Ireland, and by the Bill it is proposed to place this system upon a broader and more permanent basis. The arrangements as to the examinations for registration will be placed under the jurisdiction of a General Council representing the Master and operative plumbers of the Plumbers' Company and the chief educational and sanitary bodies of the United Kingdom, with branch councils in Scotland, Ireland, and Wales. It is proposed also to give the Council power to promote technical education among plumbers, and to exercise discipline among those whose names are enrolled upon the register. The Bill does not contemplate any monopoly, and it does not interfere in any way with the rights of non-registered plumbers. It prohibits, however, such plumbers from representing themselves to be registered."

#### "THE INSTITUTE ABROAD."

#### THE ARCHITECTURAL ASSOCIATION SOIRÉE.

"THE INSTITUTE ABROAD," a musical play by Mr. E. Howley Sim, produced at the annual soirée held at the Matinée Theatre on Thursday night, proved quite sufficient to upset the gravity of both the younger and older members of the Architectural Association. "The Institute Abroad" is an adaptation of last year's play, "The Celestial Institute," and, although an entirely new play would perhaps have been preferable, the joint effort of Messrs. Sim and Leonard Butler (the latter supplying the music) met with a very warm appreciation. The action of the play is indicated by its title. Abroad—we are not quite sure whether it is Africa or Turkey—Architecture is trampled in the dust, though not without great pomp and ceremony. In the first act we are introduced to a number of Moorish girls, who are architectural students, and to a trio of Architectural Association travelling students, who attempt numerous jokes remarkable, for the most part, only for their feebleness, but which were immensely appreciated, nevertheless, on account of "professional colouring." The second act is the more humorous of the two. In it an Institute meeting is burlesqued, and speeches are delivered which certainly possess the charm of novelty. The music is bright and tuneful, one or two of the numbers being particularly attractive. Mr. S. Constanduros carried off the honours here. The acting deserves a special word of praise. Mr. G. B. Carvill and Company produced the piece very creditably, and proved that dramatic ability in the ranks of the Architectural Association is by no means a diminishing quantity. Mr. Carvill adequately sustained the leading rôle—one Blarney Barnoolley, an adventurer and company promoter, who receives an appointment as president of the Institute—a position for which applicants "possessing some knowledge of Architecture" are asked for. Mr. F. D. Clapham was an entertaining "Librarian of the Institute," and Mr. Alfred Stalman and Mr. F. Collins as "The Sultan" and the "Secretary of the Institute" respectively were also very successful. The three leading ladies were the Misses Blanche Selig, Grace Wyldé, and Ada Yerbury, all of whom showed some ability. The soirée was largely attended, and presided over by Mr. Beresford Pite.

#### THE ROYAL ACADEMY.

##### SECOND NOTICE.

IN taking up our notes where we closed them last week, we cannot do better than give first place to the design for the chapel of Douglas Castle by C. W. Whall (1838), a really fine drawing of marble work and other decoration, chiefly in soft greens and greys leading up to stronger colour in the reredos. The general tones are light, and the drawing forms an effective companion to Mr. H. Wilson's more richly coloured one of the staircase, Welbeck Abbey, the iridescent effects in which are equal to anything that Mr. Wilson has previously exhibited, the blues and greens running into full purple in a masterly way. It seems, however, a pity that some more effective echo could not have been found for the mass of glowing red on the wall at the further end, the area of this being now a little too sharply defined to be quite pleasant to the eye. A drawing such as this is likely to disarm a cold-blooded criticism of the Architecture it illustrates, and, though it is quite conceivable that

a warm key shows a pleasing design for a house at Headingley by F. W. Bedford (1864). We should like to see more of Mr. Bedford's work at the Academy, his *technique* and colouring being far above the average in Architectural circles. No. 1868 is also a good drawing for a rector's stall by Gerald Cogswell, an unpretentious design that at the same time displays considerable individuality; while the same may be said of Mr. G. C. Carter's font, though in the latter case we incline to think that rather too much insistence has been placed on squareness and angularity, characteristics that are not, however, unsuited to the material in which it is designed. In No. 1873 we find the façade of the principal building at Earl's Court Exhibition, a work that we have hitherto associated with the name of Mr. A. O. Collard.

The restraint exercised in Mr. Jackson's design for new boarding-houses to Westminster School will prevent their jarring with the old buildings surrounding them; the plan seems somewhat crude in its arrangement, though possibly it satisfactorily meets the requirements of the case. The small sketch we give does scant justice to No. 1890, a very

CHURCH OF ST. COLUMB

BY W. A. PITE

Mr. Wilson's designs may justify an occasional charge of affectation or of inconsistency, we stand before his drawings and forget to make it.

Reluctantly leaving these two works, we continue on our way, finding close at hand Mr. R. S. Balfour's successful Soane design (1846), more noticeable for its good taste in detail than for imaginative force; the way the entrance cuts into the first floor, destroying the solidity of base to the pilasters of the central block, is rather a weakness in this design.

Mr. Mountford's new chancel to St. Anne's, Wandsworth (1849), appears to be skilfully adapted to the existing building. No. 1850 is a drawing of Mr. Colcutt's recent addition to the Savoy Hotel, by A. W. Prentice; it is vigorously handled, but somewhat hard in quality. No. 1851 shows a not unpleasing design for a Church at Exeter. The casual visitor must marvel at the exceeding activity of that city in this direction. Near this last Mr. Reginald Blomfield has two drawings, the more important of which is a scholarly Georgian design for a school at Hammersmith, in which the only unhappy feature seems to be the arrangement of balustrade between the centre and wings; while the other is a somewhat more freely treated sketch for a Parish Institute, of a simple character and apparently well suited to its purpose. An attractive water-colour in

bright and effective water-colour of a Byzantine interior, representing Mr. W. A. Pite's design for the Church of St. Columb, Lancaster Road, a remarkably interesting treatment of the subject. Another design for a Church (1903), also showing an interior of Byzantine character, is by Mr. A. C. Hick, in which the columns of the nave arcades appear in the drawing to be somewhat stunted in proportion, perhaps the only point to which exception could be taken. Mr. C. A. Nicholson gives us, in No. 1896, another of his successful water-colours, in this case a font and cover of his design placed in a Devonshire Church; simple and severe in its general lines, well fitted to its position, and avoiding too ponderous an effect by judicious proportion and detail. Messrs. Bateman and Bateman's design for a house and outbuildings near Birmingham (1905) shows a quiet breadth that renders it far superior to their work exhibited in No. 1893. St. Mary's, Kettering, by Messrs. Gotch and Saunders (1918), is a building in which good proportions seem marred by a thinness and poverty of detail.

With regard to design No. 1917, we can only imagine that it found its way into the Academy cellars some half century ago, and has only this year been accidentally unearthed and hung as some compensation for the delay. Near at hand we come to a drawing signalling

the advent of the upholsterer, with a design that does him, indeed, reasonable credit, though we feel tempted to call "Author," and see what surprise the rising of the curtain has in store for us.

Of designs for the decorative accessories of Architecture we find rather fewer this year than in previous Academies, but, on the other hand, the actual work itself is year by year gaining ground in the sculpture room, and, now that the principle is admitted that the term

sculpture may be so extended as to include many of the accessory Arts, we may expect to see a great extension of the limitations that have hitherto governed the admission of such works. At present, while designs for stained glass, metal work, and wall decoration are found in the Architectural room, much that is quite as intimately connected with the Art of building finds its place with the sculpture.

We may note the window by Messrs. Shrigley and Hunt (1764) as one in which the balance between white and coloured glass is well kept; and those by Mr. William Aikman (Nos. 1909 and 1911) as possessing attractive qualities of line and tone. The bronze gates designed by J. J. Shaw are well drawn, and could be carried out with good effect if the masses were grouped with more variety; as it is, there is a slight impression of too even a distribution of parts that renders them rather monotonous in character. They compare favourably, however, with the design for wrought-iron screen and gates shown in No. 1792, which is commonplace and lacking in expression, conveying no definite idea as to the parts opening or their rational structure.

The most interesting piece of decorative work is the design for a painted reredos (No. 1915) by Mr. Joass, in positive colour with well studied lines to the inclosing frame.

In the Central Hall we find several pieces of sculpture architecturally interesting. A fine recumbent effigy of Archibald Campbell (No. 1943) by C. McBride is placed on a cist having regrettably commonplace detail. Nos. 1945 and 1947 are welcome as examples of sculpture for a recently executed building; their position is shown in the small model No. 2022, but might not the full-sized works have been raised to a position more nearly corresponding to that in which they are actually placed? In No. 1752 the figure is expressive and forcible, but loses considerably by reason of the extravagance of the scrollwork against which it stands. Mr. Reynolds Stephens has a panel in low relief (No. 1958) in which the balance of composition is admirably maintained.

Mr. Alfred Gilbert's striking piece of work in the Sculpture Gallery challenges instant attention, and repays most careful study. The general forms are simple, but the ornamental

detail is fraught with interest, the lines flowing and returning on themselves being full of grace and character, while the selection of coloured materials for the crowning group is a marvel of skill.

Mr. Gilbert's other exhibit of a design for a medal should also be noticed, while one is hardly likely to miss several works by Mr. Alexander Fisher, translucent enamels, possessing delightful qualities of colour, set in metal work displaying considerable originality. In the design of which we give a sketch (No. 2001), the conventional character of the enamel leaves nothing to be desired; but in the portrait of Lady Elcho, the naturalistic treatment of the head makes it too obtrusive, and somewhat mars the decorative effect of the whole. Mr. Onslow Ford's statue of Dame Alice Owen, and his memorial to Professor Jowett, scarcely please, but should perhaps only be judged amid the surroundings in which they will take their place. Mr. Frampton's panel (2042) hardly seems as happy as some of his previous works in low relief, not so much from any failure in the modelling as from the fact that the strong contrasts of tone in the frame do not permit the eye to rest satisfactorily on the centre of interest. A looking-glass by the Countess Gleichen should not escape notice, but the only two exhibits representing the Art of wood-carving are, to say the least of them, inadequate.

The work of the painter is less closely in touch with the Architect than is that of the Sculptor, but, regarding it from a colourist's point of view, few can fail to be interested in the work of E. A. Abbey, J. W. Waterhouse, Byam Shaw, H. J. Draper, and Harold. Speed, while in R. W. Macbeth's painting in the long room is a charming study of a North Country manor house. We must, however, leave to our reader the pleasure of seeking and finding other jewels for himself, though we warn him that this year they are lamentably few and far between.

#### ASSYRIAN PALACES.

IN the Theatre of the Royal Dublin Society, Mr. G. Baldwin Brown, M.A., delivered the second of a series of lectures on Ancient and Mediæval Art. The lecturer, in the first instance, dealt with Art as exemplified in Assyrian palaces, and gave a minute account of the character of the Architecture and decorations thereof. He said in the representation of animals the Assyrian showed a surprising degree of realism. Turning then to "Phœnicia and the Arts connected with the Temple," he said the Phœnicians were known more in history as a roving, seafaring people, and it had been questioned whether they attained to anything of artistic importance. However, the theory that commercial development was incompatible with artistic excellence was refuted by the case of the Florentines, and also of the Venetians; and scruples as to the artistic capacity of the Phœnicians were really set at naught by the account in the old writings of the works executed by them. The Phœnicians probably excelled any other of the old nations in producing grand effects in building by the use of very large materials. The biggest stones used in masonry were cut by their hands, and some of the stones used for the terraces on the Hill of Zion lay at the present day where they placed them. Some of these were 20ft. long by 3ft. in height, and remained there intact after the lapse of 3000 years. From the accounts

they had of their achievements, there could be no doubt of the artistic attainments of the Phœnicians. He then showed on the screens specimens of bas-reliefs and other types of Assyrian stone carving. The lecturer then turned to Art as it existed in the early Greek age, and dealt with the recent discoveries on the site of the ancient Mycenæ. There was little, he said, of continuity between this older Art and the later Greek Art proper. Homer regarded the Phœnicians as holding the highest place in Art in his age—800 or 900 B.C.—and appeared to regard the Greeks as copying from them. It had been said of Greek Art proper that its groundwork was centred in the world of Olympus. About 650 B.C. the human form began to force itself in as a motive in their Art, and soon became the preponderating feature. The commencement seemed to be in the shaping of figures in wood, and even in the second century before Christ they had the testimony of Pausanias that he had seen the remains of a wooden column. In conclusion, the lecturer showed types of early Greek vases and coins, and also views of the present site of Olympia, and the excavations carried on there by the German Government.

THE Horniman Free Museum, which was dedicated to the free use of the public in 1890, occupies a commanding position in London Road, Forest Hill, and contains curiosities collected by Mr. Frederick John Horniman, M.P., during the past forty years from all parts of the world. The exhibits include Cyprian and other pottery, treasures from the Holy Land, mummies from the tombs of Egypt, Oriental manufactures and artistic productions, and natural history and zoological curiosities. Two years ago a park and a recreation ground at the rear of the museum were thrown open to the public, and Mr. Horniman has now presented an additional eight acres to the neighbourhood. The added area will be a welcome acquisition, for the recreation room is very popular and an extension was much desired.

## In Istria and Dalmatia with a Camera.

By W. LAW BROS.

### III.—SEBENICO AND TRAU.

**S**EBENICO, the next town of any considerable importance we visited after Zara, is most picturesquely situated on a small creek or inlet of the sea, which constitutes a natural land-locked harbour, accessible at all states of weather, and frequented by a large number of coasting steamers which coal here. A small colliery, a few miles in the interior, is being developed, and at present produces about 500 tons a week. The town itself is situated on a low, pyramidal hill, the summit of which is crowned with a huge fort of mediæval date, but kept in repair and garrisoned at the present time by the ever-present Austrian troops.

The finest, and indeed the only building of any great architectural interest in Sebenico, is the Cathedral, a stone-roofed building commenced in 1443, and finished in 1536, according to Hartleben's "Führer durch Dalmatien," which is the fullest guide book I have discovered. Even the ubiquitous Baedeker gives only a few pages to this coast, quite disproportionate to its interest, although perhaps in full proportion to its number of visitors. But this is a digression from the description of the Cathedral, which should certainly be fitted with some special label to suit it. Classic it cannot be called, nor even Renaissance, nor Gothic, and it would be equally inappropriate to call it Romanesque, but yet it combines many of the leading features of all these styles. Perhaps it is best to avoid any descriptive label, and allow each reader to invent his own term from the photograph here reproduced. The most striking difference between it and the vast majority of Churches is in the absence of the huge gables which form such an imposing feature of most of these buildings. The west front looks specially bald and wanting in finish from this cause. On the other hand, one cannot help admitting that what is lost in exterior dignity is gained by the lofty interior, which is correspondingly improved, and the grandeur of this interior must be seen to be appreciated. Another great advantage arising from the suppression of this false wooden roof which surmounts the stone vaulting of our Churches

is the diminished risk of fire when the plumbing fiend is called upon to repair its outer skin of metal, and not infrequently sets fire to the dried woodwork and causes irreparable mischief. The outward thrust of these timbers is also avoided, and there is a general air of more sincere and honest construction than in our Gothic roofs. I would call attention to the elegant design of the north door, of which a view is given. The figures of Adam and Eve are by no means infrequent at these Dalmatian Church doors, and give a curious impression of pagan rather than of Christian sculpture. The incongruous combination of these figures with the Byzantine lions as the supporters of the columns on which they stand is also *bizarre*, but the whole effect of grouping and play of light and shade is most charming.

The Piazza dei Signori, as the grand square is nearly always called (the French Grand Place), is very Italian in character, and may be looked upon as a development of a special type. The Loggia is always present, and forms a marked feature in Italian social and municipal life. Here were made proclamations, and here sat the authorities of the respective cities at the times of public processions and sports which entered so largely into the life of these cities. But beyond the Cathedral and the square in which it stands there is little of interest to retain one at Sebenico, and the next place which claims attention is Trau.

If Sebenico is picturesque, what can we say of its small neighbour with a quarter of its population? There is here far more beauty and grandeur in the mass of Churches with which its streets are crowded, and at each step one sees some new feature to admire.

With a fairly extensive acquaintance of

SEBENICO CATHEDRAL.

cities both at home and abroad, I do not know any which can compare for architectural beauty with Trau. In proportion to its size it is fuller of interesting buildings than Oxford itself, and higher commendation than this is impossible. The view from the adjoining island of Bua gives some idea of this wonderful wealth of Architecture.

The city itself stands on a small island between the larger island of Bua and the mainland, but the channels between these islands are so narrow that they are easily bridged, and form one whole.

If you start from the northern end of the line of quays you will see at the extremity of the town the old Venetian fort shown in the photograph, now known as the Castel Camerlengo. Its machicolation shows that it was created at a time when the earliest artillery had rendered useless the primitive wooden *hourdes* which were previously erected in times of danger as a temporary defence against attacks on the walls, but which became at once obsolete when gunpowder came into use. We pass several monasteries and Churches which would suffice to establish the architectural reputation of many a larger town,

SEBENICO CATHEDRAL. WEST FRONT.

SEBENICO CATHEDRAL. NORTH DOOR.

and reach the delightful little fourteenth-century Dogana or custom-house, with the Venetian lion mounting guard prominently on its façade, then come remains of ruined walls with gates, bastions, and towers, which should give innumerable subjects to Artists and architectural students, and after a wonderful series of picturesque combinations, each more interesting than the last, arrive at a point from which we get a view of the east end of the Cathedral. This is triapsidal, of graceful proportion, and is typical of the best period of Venetian work. Turning to the left along the narrow lanes, formed of mediæval houses, you will come into the Piazza dei Signori, and see the Loggia and Palazzo Comunale which are clustered round the Cathedral. This consists almost entirely of early thirteenth-century work, and, as will be seen from the illustration we give, is simple in character, and of very fine proportions. The west front is concealed by the Galilee porch which is entered by means of the arch, also illustrated. On entering this porch or vestibule from the brilliant mid-day sunshine outside, the darkness renders it difficult to see the detail; but as you get accustomed to the subdued light you will be struck by a doorway, which, perhaps, can hardly be rivalled in Europe.

Of all styles of Architecture, probably the late Romanesque is the most ornate, and this is no exception to the rule. You see here the most marvellous composition of figure, animal, and floral design which the Architect has yet produced, while the Sculptor has most worthily carried out the superb design. No drawing can do justice to the delicacy of touch shown in the execution of the work, but unfortunately the position of this door in an ill-lighted narrow passage renders it impossible for the camera, even with the widest angle lens, to get a straight view, and to take at an angle such a fair piece of work is to give a most unjust representation of it. I was able, however, to obtain a view of one of the jambs, which is here shown. Hours might be spent in an adequate examination of the details of this doorway. It is with a sense of relief that you turn into the interior and rest your wearied brain with its quiet, dignified calm solemnity. With massive round arches and square solid piers, it seems calculated to ignore the flight of time, and to be quite impervious to decay. The ciborium or tabernacle over the altar carries one back to the early thirteenth century, and you wonder whether anything short of an earthquake can cause any settlement or destruction of such massive and solid work. I have paid two visits to Trau, but yet had not time to visit the many architectural wonders it has to offer. When one reflects that it is only a small country town of 3500 inhabitants, one cannot help wondering whether any other town in Europe, of ten times its size, has such attractions.

ABOUT £700 has already been promised to the fund for restoring the very ancient Church at Witton-le-Wear, Bishop Auckland.

It is proposed to expend £25,000, of which about £14,000 have been subscribed or promised, in building Churches at Newport, Swatter's Car, and on the borders of St. John's parish, Middlesbrough.

As a result of the notice given by the Oldham joiners and carpenters of their intention to seek an increase of wages, a decrease in the number of working hours, and a limitation of the number of apprentices, the Master Joiners' and Builders' Association has signed the revised code of working rules, agreeing to the cardinal points, which were that the men be advanced from 8½d. to 9d. per hour both winter and summer, for inside and outside work. Working time was also allowed as the men desired, all overtime worked up to eight o'clock to be paid for at the rate of time and an eighth; after 8 p.m. to 10, time and a half; after 10 to starting time next morning, double time. The employers also consented not to admit apprentices to the trade over 16 years of age. The rule as to the number of working hours was agreed to, which, according to Rule 2 of the revised code, shows a reduction of the weekly hours from 54 to 51 in summer, and to 46 in winter.

A A

#### THE ARCHITECTURAL ASSOCIATION. JUBILEE CELEBRATIONS.

THE Architectural Association has completed the fiftieth year of its existence. Fifty milestones have been passed, and to-day the coach, which has assisted many tired students

numbered over 200, and amongst those present were Professor George Aitchison, A.R.A., Mr. H. C. Richards, M.P., Dr. A. S. Murray, Messrs. W. H. St. John Hope, J. Jacob (Master of the Carpenters' Company), W. J. Cloake (Master of the Painters' Company), H. W. Pratt (President-elect), H. Lovegrove, J. M. Brydon, Alex. Graham, W. H. Seth-Smith, T. E. Coll-

LOGGIA, SEBENICO.

along the high road of Architecture, enters upon another stage of its long journey, better equipped, and with brighter prospects of sunshine and calm than has perhaps favoured it during many of the preceding stages. The jubilee of the Association was celebrated last week, and, as befitted such an auspicious occasion, the usual gravity of its deliberations gave way to a becoming air of festivity. A banquet at the Trocadero Restaurant on Wednesday night was followed on Thursday by a short conference, held to discuss the work of the Association in its various aspects, and in the evening of the same day by the annual soirée at St. George's Hall, Langham Place. But as to the banquet. Mr. Beresford Pite, the

cutt, Paul Waterhouse, G. H. F. Prynne, H. Tanner, W. M. Fawcett, F. W. Pomeroy, J. Sulman, Professor Kerr, J. Edmeston, T. M. Rickman, J. S. Quilter, J. D. Mathews, J. Norton, R. Plumb, T. Roger Smith, H. L. Florence, J. H. Christian, T. Blashill, H. C. Boyes, Aston Webb, T. H. Watson, John Slater, Leonard Stokes, H. O. Cresswell, E. W. Mountford, J. A. Gotch, F. T. Baggallay, S. F. Clarkson, W. D. Caröe, Cole A. Adams, H. D. Searles-Wood, W. White, J. P. Seddon, J. K. Collins, T. W. Goodman, J. Ely (Manchester), C. Hadfield (Sheffield), W. Henman (Birmingham), S. P. Pick (Leicester), and E. B. Vaughan (Cardiff). Dinner over, the toast list was opened by the President, who gave the usual loyal sentiment.

A VENETIAN FORT, TRAU.

President, who previously held a reception, was in the chair, and on his right was the Right Rev. the Lord Bishop of London, and on his left Viscount Halifax—Lord Russell, the Lord Chief Justice of England, who had been announced as one of the principal guests, being unable to be present. The company

Her Majesty the Queen, he said, had bestowed an infinite blessing on the production of

#### THE FINEST WORKS OF ARCHITECTURE

by the glorious peace which had been maintained within her realms, and by the wonderful wealth with which Divine providence had

blessed her subjects. If it had not been for these two priceless benefits they, instead of being met there in festive joy, would have been a scattered band of hungry Architects. As it was, without any merit of their own they would go down to posterity labelled with the magnificent name of "Architects of the Victorian Era"—the greatest era of English history, and consequently the greatest era of English Architecture.—The Royal toast having been duly honoured, the President submitted the toast of "The Church," and said the connection existing between the profession of Architecture and the Church was a connection which appealed to every Architectural student of this land. That connection was an exceedingly difficult one to define. The enthusiasm which Ecclesiastical Architecture aroused in the breasts of Englishmen was due primarily without a doubt to the magnificent character of our national Ecclesiastical Art. When they proceeded further, and asked themselves the question to what was due the pre-eminent character of this Art, they were face to face with the core of a difficulty in definition.

and English literature—in the days of Bacon and of Shakespeare—there was being fostered under these new influences, such work and such life as that of Inigo Jones and Sir Christopher Wren, which culminated in the Reformation. In the history of that Association—within the recollection of its past Presidents, whom they were delighted to meet on that occasion, and many of whose lives covered fifty years of Architectural work, there had been conflicts of tastes and opinions and battles of styles. These had been of the twelfth, fourteenth and fifteenth centuries, but the Architects who had debased Architecture had disappeared in the throes of the Renaissance, and to-day they were equally prepared to share the admiration of the fifteenth century and to distribute the honour equally amongst the unknown representatives of the Ecclesiastical Art and the concrete elements of Art and life as those of Jones and Wren, to whom he had referred. He asked them to drink heartily the toast of "The Church."—The Right Rev. the Lord Bishop of London, in replying in an attractive after dinner speech, said

one mighty span, offering space and largeness, things absolutely necessary for the development of every great Art. It was for these two reasons, first, that the Church required the exposition of ideas, and, secondly, that the mere form of its building was large, spacious, and splendid, that it called upon Architects, not only in their spiritual and moral nature, which they recognised played so large a part of any Art, but also in their

#### CAPACITY IN SIMPLE STRUCTURAL DEVELOPMENT.

giving those opportunities which had been so worthily made use of in the past, and also in the present. For since coming to London he had been struck by the exceeding resourcefulness of Architecture in modern times. Before he came to the metropolis he used to admire ancient Art; now he was learning to admire modern Art. The great growth of this great City had called for the Architect's work in every possible way, and as he went about his diocese he saw so many modern Churches which, in that quality which he called re-

TRAU CATHEDRAL. FROM PHOTOGRAPHS BY W. LAW BROS.

He felt that with the Lord Bishop of London on his right hand—a man than whom no one had a more comprehensive knowledge of the underlying secrets of our national history, he might venture to suggest that the problem which unites our Church history and our Art in a knot, in a chain, in a stranded cable, which drew them to the admiration of Cathedrals and of village Churches, was a subject which made them feel honoured in having his lordship as their guest that evening. No kind of Architecture in our own land aroused so much enthusiasm as Ecclesiastical Architecture. Their sketch-books were full, from the earliest days in which they could draw arches in perspective with attempts at Cathedrals and other

#### ECCELESIASTICAL BUILDINGS.

But there were other matters connected with Ecclesiastical Architecture which linked themselves to their minds on the present occasion, and they were conscious that when the Church was in a prosperous condition Architecture was also prospering, that the palmy days of things Ecclesiastical were also the palmy days of Architecture. The magnificence of the thirteenth century in England was proverbial. We were scarcely yet beyond the reach and glamour of its revival. But passing through the thirteenth century to the Elizabethan period, in the heyday of English intellect

they were met that evening either as Architects or as

#### PEOPLE INTIMATELY CONNECTED WITH ARCHITECTURE.

and, indeed, that was a definition that might apply to all men, for everyone was intimately connected with Architecture in that they all wanted some shelter over their heads to keep off the rain. To whatever profession they might belong, or whatever vocation they might pursue, they all felt that they owed a debt to Architects. But he thought there was this difference between the Church and other professions: that whereas everybody wanted Architecture which was adapted simply and solely to convenience, the Church wanted Architecture adapted to the expression of ideas. And it was simply and solely because the Church stood in that peculiar position to Architecture that it had inspired those engaged in the profession to erect those mighty works to which the chairman had referred. A house was a building split up for convenience into small rooms, and even a great building for municipal purposes, whilst affording artistic scope in the facade and general external treatment, had also to be split up into rooms, but the Church was the only building which directly challenged the Architect to do his best. Outside and inside alike the Church was

sourcefulness, called forth his warmest admiration. Our modern buildings demanded a disposition of site unknown in the old days. Architects were called upon to make use of sites which at first appeared very unpromising, and he was struck with that great capacity shown for using the small opportunities afforded and adopting the land to the purpose for which it was needed. Higher praise, he thought, could not be given to any Art. After all, vitality consisted in making use of opportunities. Now he thought they often cast a glamour of romance over the past which they denied to the present. And in the admiration of a past age it was often said that to-day they were not so artistic. He was not quite sure that if they studied in detail the

#### HISTORY OF OUR CATHEDRALS

they would be led to that conclusion. Of course people in the old days were not in a hurry. They did not want their buildings adapted to vastly growing populations, but were quite prepared to erect a building with no regard to the population which dwelt around. And then they must remember that these great Cathedrals had to compete for pilgrims, and were therefore built purely as advertisement in order that they might draw pilgrims from the other shop, which was not nearly so well adapted. They would

find that a great deal of the history of our Cathedrals was explained by this formula. Neighbouring Cathedrals competed with one another. First of all the choir was erected, and then the nave, and as they were proceeding to put up a west front the news was brought that a neighbouring establishment had gone one bay better; and, of course, it was necessary not to be cut out of the race, as otherwise the pilgrims would go to the other

necessity of providing increased Church accommodation were equally heavy. He was quite sure, however, that Architects were trying to do their best in all the Ecclesiastical buildings entrusted to them, and he was also sure that not only the buildings which had been erected by the piety and the genius of the past, but the construction of other buildings in the present, would be not unworthy of their predecessors. He wished them prosperity in the

arduous Profession they were engaged in. A clergyman must feel his dependency on the skill of the Architect—that all that he could say, all that he could do, was largely dependent upon the Architectural surroundings which the Architects would supply. He thanked them for the good work they were doing on behalf of the Church, and also thanked them for the way in which they had honoured the toast.—The Right Hon. Viscount Halifax proposed the next toast—“The Architectural Association.” There was one point, his lordship said, in which he was in total and entire

disagreement with the Bishop of London, and that was that ideas were by no means necessary in the construction of houses. It was quite true that from the Queen on her throne down to the humblest inhabitants all must live in houses, but he entirely disputed that ideas were unnecessary in connection with those houses. On the contrary, the great desideratum, the one thing more necessary than another was that

#### HOUSES SHOULD EXPRESS IDEAS.

How dull and uninteresting some houses were, and how delightful others were. The object of the Association was, he was informed, “the education of the young Architect as a professional student,” and just because they must live in houses, he earnestly wished success to the Association. When he knew how much influence a house had upon its occupants, and that so much depended upon windows and doors and fireplaces, not merely for comfort, but also for a sense of well-being, he confessed that there was no institution in England for which he wished a greater development than the Architectural Association. But there was another point in which he would like to say how completely he re-echoed the Bishop's words. He did feel that if there was one thing absolutely more trying—nay, enraging—than another, it was the position of the Architect who found himself with a beautiful scheme, something which he knew was most admirable, cut down in every way by an employer, who spoilt, not only his ideas, but his future prospects. In such a position the Architect must feel half inclined

to throw the plans in a client's face, and say, “You and your house perish together.” He had to confess that he went to that banquet in a state of considerable ignorance as to the objects and work of the Association, but he had been told that it had now been in existence for fifty years, and that many of the first members of the Association had during those fifty years come to the front in the Profession and

#### LEFT THEIR MARK UPON ARCHITECTURE.

He learnt that one delightful feature of the work of the Association was a week's excursion in the provinces every year, held for the purposes of sketching and visiting ancient buildings, and generally to foster the common interest of the Association. He could conceive nothing more delightful, and if such a state of things were possible, he should like to express the wish that some of those who did not belong to the Association might, in some honorary capacity, be invited to join the excursions. He was also told that the Institution amidst its artistic work by no means ignored sanitary science. He was obliged to say that all matters connected with drains and the like he found profoundly uninteresting. He had the greatest pleasure in proposing “The Architectural Association,” and he hoped that its anniversary celebrations would be repeated sixty years hence, when it would be said that during the fifty years since the Association's jubilee, English Art had made greater progress than it had during the period of which they were speaking that evening.—The toast was cordially honoured, and in replying, the President said they would understand something of the interest of the Architectural Association; something of the memories aroused at that gathering, and something of the hopes they felt for the future when they reflected that they were gathered to celebrate its fiftieth anniversary. When at the outset they were a little group of students, and also through the burden of years they suffered many vicissitudes; then lapsed into a state of apathy, but never unto death. But the hopes of the founders had been more than realised, but he could scarcely speak on this subject in the presence of their first President.

#### THE OCCASION WAS UNIQUE.

he thought, when the first president of an association survived to honour it with his presence at its jubilee celebrations, as Pro-

CATHEDRAL, TRAU.

establishment. The more one studied the history of the Middle Ages the more one found that prosaic and commonplace suggestions really lay at the bottom of a good many minds. In replying to the toast he spoke not only personally but on behalf of the clergy. Now the clergy might not appear in very great estimation with some of his hearers from a professional point of view, for they frequently stood to the Architect in the relation of the employer of labour, and he need hardly say that an employer embodied reminiscences of a

#### VAST AMOUNT OF UNINTELLIGENT CRITICISM.

It was their fortune—he would not call it misfortune—who belonged to that Society to be subject to a vast amount of unintelligent criticism. Well, he consoled with them. More criticism than was necessary was often proffered—in fact, it was often offered with a freedom and volubility which excited their admiration and respect. Of course, when they got it they did not like it. But he thought that on a little reflection all of them would welcome criticism when it came in its heartiest and most uncongenial manner, for it only bade them put themselves more in accordance with those by whom they were surrounded; and they need not shrink from such a contact. The other day he heard the story of a curate who went to call upon the great lady of the village, in order to introduce his newly married wife. Now, it was always a bad habit to make a joke at one's own expense. In introducing his wife, the curate remarked: “A poor thing, madame, but mine own.” The lady looked at him severely and said, “Sir, your wife ought to have introduced you as ‘a poorer thing, but my owner.’” Now he had often imagined how many Architects went to the clergy with plans and said in a humble way, “It is a poor thing, but my own,” and after listening to their criticism, went away uttering under their breath, “They are poorer things, but my owners.” This was what they all had to endure, and he would only assure them that the clergy were subject to the same thing, and though they perhaps frequently demanded of Architects to

#### MAKE BRICKS WITHOUT STRAW.

the demands made upon them (the clergy) by the increase of population and the consequent

MUNICIPAL PALACE, TRAU.

fessor Kerr did their Association that evening. Professor Kerr had maintained his interest in the Association throughout, and had aided it with his judgment, and he was present on that occasion to witness their sincere enthusiasm and the success which had attended the efforts of those instrumental in founding the Association. When they reflected that Professor Kerr was not alone on that occasion, that there

were sitting at that board those who, before he was called to the chair, were concerned in the initiation of what they were there the embodiment of. They were honoured with the presence of so distinguished an architectural draughtsman and so wonderful an Artist as Mr. J. C. Colling, and also Mr. Sedding. Looking from their ranks to the chartered royal body, which took upon itself the official exercise of those duties which developed upon the representative body of a profession, they recollected that Mr. Cates, one of its office-bearers, had formerly been the life and spirit of the Architectural Association, and it was his foresight which saw the necessity for some qualifying test for architectural students. After a lapse of something like a quarter of a century, the Royal Institute of British Architects instituted the examinations as they now knew them. But the Institute without the students trained in the ranks of the Architectural Association would have had a poor chance of carrying out the examinations. It (the Association) had supplied the sinews, and while looking up to the Institute with thankfulness and gratitude it was almost inclined to say that the Institute was the Association with an important difference. And coming to the present position of the Association, they found that a large number of those joining the ranks did so for the

#### EDUCATIONAL FACILITIES

offered in their studios and classes, and left the Association when they left London. At present, the Association numbered 12,000 active members, and although the number of students attending the classes only numbered 200, they must not forget the educational agency of the papers, discussions, excursions, etc. The Association had few needs. It supplied its own teachers, it supplied its own taught; but they had a burning need which, he was sure, must commend itself to everyone. The Committee hoped that as the result of the Association's Jubilee celebrations it would see its way open to obtain some building which would not be hired, and which would be an architectural embodiment of what he might call the glorious history of the Association and of its present glorious aims. On behalf of the past presidents, the committee, and all connected with its work, he begged to appeal earnestly and heartily to their successful brethren to provide them with the means of obtaining suitable premises in which to conduct their work. They at present had premises overcrowded, and those who knew how they had to conduct classes and knew with what generosity the Royal Institute of British Architects had placed its rooms at their disposal, and how loth the Association was to encroach upon its hospitality, and yet how necessary it was to do so, would agree that new premises were badly needed, not only class rooms and meeting rooms, &c., but a library to house their invaluable and ancient collection of books which provided students with that literature which was indispensable to the Architect. He thanked them for the kind way in which they had honoured the toast of "The Architectural Association."—"The Royal Academy, the Royal Institute of British Architects and Kindred Societies," was the next toast submitted by Professor Kerr. In its connection with other societies, the speaker said, the Architectural Association took its highest ground. It looked firstly to the Institute of British Architects as its head-quarters of organisation. The Institute recognised

THE ASSOCIATION AS A JUNIOR INSTITUTE more expressly by preserving one seat on the Council for a member of the Association. Now the Institute of Architects, of course, represented the profession of Architecture in this country, and, in fact, throughout the whole of the Queen's dominions, and it would be known to many of them that its operations were divided into four sections—Art, Science, Literature, and Practice. Now, taking Art, the Association claimed connection with the Royal Academy. The Royal Academy was to it the representative of Art in *excelsis*, and the natural aspirations of many of the younger members of the Association turned towards the Academy. He did not see why

any young man should be discouraged in cherishing the hope of sooner or later becoming a member of the Royal Academy. One thing he had always ventured to uphold in connection with that Association, and that was the encouragement of self-conceit. He considered self-conceit a most important agent founded by Nature for the advancement of youth. Artists were apt to say that Architects were a little in the way. But the time would come, he thought, when, instead of being a little in the way, they would be very much at the head of Art. Passing from Art to Science, he thought they ought to pay homage to the Institution of Civil Engineers. He believed that the young architectural students ought to be encouraged to study Science a good deal more than they did, so that the time would come when the Forth Bridge of the future would be rendered in some degree attractive by somebody. They recognised in the Institute of Civil Engineers that perfection of mathematical science in which no Architect ought to be deficient in knowledge. And, coming to the department of Literature, the Association was linked to the Society of Antiquaries. Many of the Association members were also members of this Society, which represented

#### THE HISTORICAL LITERATURE OF THEIR PROFESSION;

and no profession in the world, perhaps, had a better history than that of Architecture. Coming, lastly, to Practice, he did not know that they could do very much in this respect, but he wanted the young men connected with the Association—the Architects of the future—to bear in mind that they were closely allied to these several departments. It was very seldom that the scientific intellect and the literary intellect were combined in one individual, but the Architect must combine both these rival branches, not to any brilliant extent. In England the public required plain practical common sense and good workmanship. They had entered a hard-working Profession, and they could not do better than study the apparently rival elements as a means of satisfying the English public. The chief function of the Architectural Association was an educational one, and throughout the whole of the fifty years of its existence it had had this one end in view—to encourage study among the coming Architects for the improvement of their Art.—The toast was responded to by Professor G. Aitchison, A.R.A. The Academy, he said, was one of the first bodies in this country that gave instruction to young Architects, and this was due to an Architect, Sir William Chambers. But this was at the end of the Renaissance period, when

#### THE REVIVAL OF GOTHIC

had hardly been thought of—although it had been thought of, for in so popular a book as "Tom Jones" there was reference to a house, "a Gothic structure which almost rivals the beauties of Greek Architecture." The Renaissance Architects—if he might call them that, for they were not Architects at all, and had no idea of what Architecture meant—were very accomplished men, almost all having been goldsmiths, while some had risen to be sculptors and painters, and what they conferred upon Architecture was no doubt one of the greatest boons that had ever been conferred upon it. The Royal Academy had adhered to their old belief that if a man could draw the human figure and was nimble with his fingers he might do any artistic work. In the present day we were taking, unfortunately, a different view of Architecture, and he thought that this was not the best way to produce men of the greatest excellence in the Art. Referring to the Institute of British Architects—of which body, through the kindness and forbearance of his brother Architects, he had been re-elected president for the ensuing year—he said that it had done what it could for Architects and Architecture, and with the Association a more practical view was adopted in teaching young men of the profession the

#### NECESSARY KNOWLEDGE OF THEIR ART.

He hoped that Professor Kerr's words would

be remembered, viz., that Architecture is a constructive Art, and that without a knowledge, and a very good knowledge, of construction, Architecture could not be expected to make the progress that it once did. He (the speaker) was a member of the Association at the time of Professor Kerr's presidency. They were all of them looking forward not to the resurrection of any old or bygone style but the creation of a modern style. He did not see why Architecture should not become again a progressive Art, as it was at one time, if they once turned their attention to pursuing it in a proper way. Religion had been a great stimulus to all the Fine Art of the world. It was upon temples, mosques, and Churches that Architecture had lavished its greatest skill and shown its greatest power. This, however, was not wholly due to the religious feeling of the people, for there was something of a more mundane character to account for the erection of buildings for purposes of public worship. The temples of the ancients were also banks of deposit, and there was no doubt that a very fine temple of elegant proportions and impressive appearance caused more people to bank their money there than did temples of a less important appearance. What Architects had to do was to cultivate their faculties and study those things which were necessary in the

#### PROGRESS OF THEIR PROFESSION,

and he had no doubt that if the attention of the Association was sufficiently directed to those matters which were absolutely necessary for Architects to study, there would, as a result, be a new style that was fitted to the taste of the present day. He did not think that the powers that be had a proper idea of the importance of Architecture to a nation. Almost all the other triumphs of the human intellect were movable, or they could be absorbed by other nations, as the work of poets, for instance, but with Architecture this was not so, though the work of the Architect would remain to point out the character of the people who lived at the time of his work. Badly as Architects were recompensed, they were paid still worse in gratitude and honour. There was little admiration for Architecture in this country. A successful painter was sought after, but few people thought much of a successful Architect; that was not the way to encourage an Art which was of so much importance to a nation.—Mr. J. Ely (Manchester Society of Architects) responded for the allied societies, and said that the provincial Architectural Societies were kindred societies to the Association in name, profession, and in the objects they had in view. The Institute was concerned more in the professional side of the Architect's work and the Association with the educational, but in the kindred societies these two branches were combined. The objects of the societies allied to the Institute were uniformity of practice, professional integrity, the advance of Architecture, friendly communications, mutual advice and assistance in cases of disputes or professional jealousies, educational facilities for students, and the formation of libraries. All these aims had been intensified, and their achievement had been rendered more certain by the alliance with the central body in London.

#### THE EXAMINATIONS OF THE INSTITUTE

had been of great use to students in guiding them, not only in the course of study they ought to pursue, but in showing them their shortcomings. The Institute, in bringing the examinations into the provinces, had afforded great assistance in guiding students. There were sixteen kindred societies allied to the Institute, and the total number of members of all of them was a little over 1000—a considerable number, considering that they were scattered all over the country.—"Literature" was the next toast, given by Dr. Murray. There was no body of professional men, he said, to whom the charm of literature brought greater delight and greater solace than to Architects. Architects knew that for many of the crosses and ills of life there was no cure like a good book. He had recently read a book by Mr. Palgrave on "Landscape in Poetry," and he wondered why there had not been done

a similar work on "Architecture in Poetry."—Mr. J. Alfred Gotch, whose name was coupled with the toast, said, in reply, that Architects were all familiar with the unintelligent criticism which the Bishop of London had referred to. One method of giving the public a little knowledge might be in literature. It had sometimes dawned upon him as a kind of hope that someone might arise in our generation and write about Architecture in such colours as would appeal even to the ordinary employer, though to do that the ordinary architectural literature would have to some extent to be avoided, for it was no use offering the ordinary public technical terms. If architectural literature was to appeal to the public, it must possess the main elements of literature and be fascinating. Architecture was something more than drains; there was a poetry about it, and there was something higher than piling bricks upon bricks or stones upon stones. He rejoiced that there was a more catholic spirit now in regard to the different styles. In his opinion this was due to literature, and he looked forward to the time, so great was our catholicity now, when a book would be written about the Architecture of Gower Street. He trusted that they would avoid clinging too firmly to the past. The future must be something different, and on different lines to the past, and it was one of the functions of literature to bring that state of things about. He objected to London holding the whole architectural genius of the nation, and one of the ambitions of the Association should be to send educated Architects into all parts of the country, so that in all parts of the land buildings which had

#### THE MARK OF CULTURE

upon them might be put up. He was struck with the remark of the Bishop of London that in his old diocese he was interested in the buildings of the past, but in London he was learning to admire the buildings of the present. As he (the speaker) happened to live in the Bishop's late diocese, the remark stung him to the quick, but he hoped that before long a remark of that kind would no longer be possible.—Mr. John Slater proposed "The Visitors." He said the Association had always done its work in an unassuming manner, and had never strained after publicity. He wished that there were more opportunities of friendly intercourse between Architects and other branches of the Profession and the general public, because meetings of that kind would go a long way to remove the misconceptions which existed as to the duties of an Architect, his method of conducting business, and his charges. It had been the practice of the Association to have an annual dinner, and as a rule the guests had been members of the Profession of Architecture. In future, could not their invitations be extended? Architecture was, he was afraid, *caviare* to the general, but he was glad to say that there had been some enlightenment in this respect. One of the most interesting signs in the past few years had been the action of the Universities of Cambridge and London in including Architecture in their course of lectures in their Extension schemes. He had been engaged as examiner for the two Universities, and he had been struck with the interest shown in Architecture by the non-professional students who had attended the lectures, though, no doubt, their interest had related to

#### ARCHITECTURE OF THE PAST.

He was glad that the Bishop of London was beginning to be interested in the Architecture of the present, but the Bishop would have a great deal to do if he wished to imbue the whole of his diocese with that view. He was told that at the Royal Academy the other day, when the galleries were crowded, the Architectural room had one occupant—an old gentleman who had gone there to take a nap.—In replying to the toast, Mr. H. C. Richards, M.P., chairman of the Society for the Protection of City Churches, remarked that Architects had often supported his petitions with respect to City Churches, and that was why he was present. He was not exactly a student of Architecture, but, like Lord Halifax, he was often a pilgrim to the architectural shrine;

he knew no greater pleasure than to behold the marvels of the architecture of Europe. In his Profession as a barrister, he had often been struck with the unanimity of Architects with regard to fees—how one member of the Profession thoroughly and heartily agreed with his professional brother's charges, and had thought that jealousies in the Profession were unknown.—"The President-elect" was the last toast, and in proposing it Mr. Aston Webb remarked that fifty pages of the history of the Association had already been written, and what Mr. Hampden W. Pratt would write none of them could say. He had no doubt of the zeal and ability with which he would occupy the presidential chair, and with the past Presidents and others, would do his best to secure suitable premises for the Association.—Mr. Pratt, in reply, said they had been looking back that evening, but the interest and the work of the Association laid in the present and in the future. There was much to encourage them in regard to the future work of the Association, to bid them go forward and commence another year with greater enthusiasm than in the past. The Association had lived on enthusiasm, and during his year of office he hoped he would have his hands strengthened by the Committee to help forward the educational work in which they were engaged. Looking back upon the past they might learn many lessons in what to avoid and what to imitate, and conservative as many of them were in the Association, he for one intended to do his best to lift high the Standard of Progress, for he felt convinced that the architectural student of to-day must ever be going forward.

#### THE EDUCATION OF ARCHITECTURAL STUDENTS.

##### CONFERENCE AT THE ARCHITECTURAL ASSOCIATION.

THERE are one or two "burning questions" agitating the councils of the Architectural Association. It was to discuss these heated questions, the President, Mr. Beresford Pite, explained, that a Conference was held at 9, Conduit Street, on Thursday afternoon. The work of Technical Institutes as relating to the Architectural Association was the first subject for discussion, and in introducing it the President explained the present position of affairs. The Architectural Association, he said, had to provide paid instructors for certain courses of study necessary, primarily, for the Institute examinations, and also necessary in view of the courses of instruction afforded at the colleges, polytechnics, and technical institutes in London, all of which had access to sources of income not open to the Association. They were no doubt aware that the London County Council had the distribution of large sums of money set apart by the Government for the advancement of technical education, and this was a subject upon which all Architects felt alike grateful and thankful. The institutions receiving these subsidies had to make the best possible use of the funds thus placed at their disposal, and that they did so was secured by official inspection and by compliance with regulations, &c. The Architectural Association found itself, in their classes for construction, drawing, science, &c., handicapped; it was in competition with these subsidised bodies, for a course of study which at the Association classes would cost a fee of say half a guinea could be obtained for about a shilling at other technical institutions. In some instances

#### THE DISPARITY OF FEE

was considerably greater. In spite of this, the Association classes were well attended, but this competition had had the effect of bringing about a reduction of instructors' fees to the lowest possible point, and the Committee was in this position: although the fees received from the students sufficed to pay the cost of instruction, there was no margin, and the apparatus used in connection with the classes had to be bought by the Committee, and the money taken from other funds. The Association could not very well retire from

the position it took up a few years before these technical institutes rose to their present position. The questions to be answered therefore were: What is the scope open to the Association in face of Technical Institutes? What policy should they adopt? Should they place themselves in line with the Technical Institutes, and apply to the Technical Education Board for a grant? Or should they seek to acquire subscriptions, and thus sacrifice their freedom and their independence? Or should they continue as at present, and do the best they could under the circumstances, trusting to other attractions to keep them together as an Association? These were questions to be dealt with in discussion.—The tone of the discussion was decidedly opposed to any action being taken towards receiving a grant from the Technical Education Board.—Mr. Trower very much doubted whether the Association, even if desirous, could obtain a grant. Its methods were not in compliance with the

#### CONDITIONS OF SUCH GRANTS.

For instance, if a grant was asked for in respect of a class for quantity surveying, it would be required that the students should not merely acquire a general insight into the subject, but that they should become quantity surveyors.—Mr. T. M. Rickman said it was a difficult problem as to whether it was advisable for young Architects to go in so largely for the technical subjects connected with building before learning the practice of their Profession. But if intuition could be obtained just as well and more cheaply elsewhere, why not look the question fairly in the face, and consider the advisability of dropping certain classes.—Mr. Hampden W. Pratt thought the Association had a work to do which no technical school or other body could perform, and therefore for the benefit of their Art he hoped they would induce their friends in the Profession to take that view. He hoped it would be possible to carry on this educational work, and he would suggest that classes of instruction in some of the more outside subjects—geology, for instance—should cease if necessary. If they dropped such subjects and threw themselves more entirely into designing, construction, drawing, and the art side of the Profession, he thought they would strengthen themselves considerably, and do more to uphold the reputation of the Association as an educational body. After other members had joined in the discussion, the President introduced the second question, which was:

#### "WHAT SUBJECTS SHOULD BE COMPULSORY

in an Architectural examination, and what studies supplementary?" Speaking of examinations as affecting the question of a man's competency, he said if an Architect was incompetent of building decently and honestly, need it mean also that he was incapable of designing beautifully? And that suggested the question of which subjects might be considered compulsory and which supplementary. Taking the Institute examination scheme, he thought they would find that everything in the preliminary examination was rightly compulsory and necessary. The intermediate examination, which came two years after passing the preliminary, was divided into two classes—Art and Science, drawing coming under the former head, and construction under the latter. He suggested that they should consider that it was necessary that every Architect should be qualified, and his qualification be a public and officially recognised one; that it was necessary that he should be a good builder, and that, in the interests of the community and the interests of the State, he should be compelled to be a good builder; and that his architectural education, secondly, should include everything necessary to perfectly efficient supervision of building. The course of study must therefore include the more practical side of the Profession, but he would make obligatory that Art which was essentially free—that Art which was to take a review of the whole history of the human race, and the whole practice of the Art of the human race. In other words, remove history and drawing and design from that part of the examination which was compulsory and obliga-

tory, and continue those subjects in the final examination which qualifies an Architect for membership of the Institute, and marks him as a man whom the public might safely trust with their public interests, their public health and wealth. The suggestion had been made that certain subjects included in the Institute examinations might be called honorary subjects, but, quite apart from the name, they were all agreed that they were essential to an Architect as an Architect, but not as a servant of the public. He would therefore include

#### THE HISTORY OF ART

and knowledge of ornament in the list of subjects at the intermediate examination, and knowledge of design at the final. He feared that a smattering of architectural history and an attempt to cram a further knowledge of architectural ornament without any knowledge of its theory and true practice, with a knowledge of architectural forms without architectural criticism, with a knowledge of architectural history gained from pictures and without a knowledge of the surrounding circumstances, really were more harmful than aidful to the architectural student, and that in the interest of architecture a body like the Architectural Association, which sought the higher qualification of architectural students, should seek to obtain from the Institute a more thorough training in our history, criticism, and architectural practice than at present existed. Into such an examination draughtsmen could enter. At the present time there was no satisfactory position for the high Art of architectural draughtsmanship, and that it was a high Art the exhibition of drawing in that room, illustrating the advancement of draughtsmanship during the history of the Association, amply proved. Of course, into such a scheme design could enter. It would be a matter of great interest to the architectural profession. They would be able every year to form an idea of the progress in artistic design the students who presented themselves for admission to the ranks of the Institute were making. At the present time the design of the Institute could only be called sketch design, and could not be considered as giving more than the slightest indication of the Architect's qualification. It was absurd to put

#### A LIMIT ON ARCHITECTURAL HISTORY

for examinations, or to say when a man's ability to design was sufficient to pass the examination; the Association wanted to carry architectural education as far as it could possibly be carried, and beyond examination point. He feared that the examinations, as at present carried on, were a distinct hindrance to architectural progress beyond examination point. What could the Association do in the matter? How could it induce students to extend their studies beyond what was required at the examinations? He suggested the establishment of an honours class, which would solve the Fellowship examination difficulty at the Institute by enabling a young man taking an honours degree at once to apply for his Fellowship. A short discussion ensued.

The International Art Exhibition at Venice was opened recently. Among the British and American exhibitors are: Messrs. Alma Tadema, Frank Brangwyn, John Collier, Walter Crane, Alfred East, G. Jacomb Hood, William Logsdail, Adrian Stokes, F. Tuke, H. Haig, Macneill Whistler, F. A. Bridgeman, John Sargent, and Miss Clara Montalba.

The special Commission appointed by the Dutch Government to discuss the scheme of draining the Zuyder Zee has just published its report, which states that such an undertaking is quite possible. The work would take thirty-one years for completion, but every year 10,000 hectares of land would be restored to cultivation. A dyke, 30 miles in length, will have to be constructed, extending from the extreme end of North Holland to the western coast of Friesland. The building of this dyke, which will be of a width of 35 yards at the base and 6 yards high, will take nine years. The total cost of the work is estimated at 26 millions sterling, and the total value of the land thus reclaimed is estimated at 27 millions.

#### What the Daily News says:

"That stately publication, 'The Architectural Review,' . . . Architectural drawings at the Royal Academy, and indeed at most other Art exhibitions, are apt to miss the recognition that may be due to them; but thanks to that new and sumptuous monthly periodical 'The Architectural Review,' compensation is at last accorded to the neglected Architects. . . . This noble number. . . ."

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 12th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

SIR M. W. RIDLEY, the Home Secretary, presided over the Select Committee of the House of Commons appointed to inquire into the subject of Government contracts in connection with the fair wages resolution of the House. Mr. William Liddell was the first witness called. He said he was the general secretary to the Belfast Operative House Painters and Decorators, and the complaint he had to make was that Government contracts with reference to the military barracks in Belfast were let to a local builder, who sub-let the painting portion to an unfair employer—that was to say, to a person who employed a greater number of apprentices than were agreed upon between the local employers and operative painters, and who paid his men 1d., 1½d., and 2d. an hour less than the recognised scale of wages. The same contractor carried out a Government contract at Carrickfergus Castle under exactly the same conditions as those which prevailed in connection with the Belfast contract, and was doing the work nine months after the Belfast contract was brought to an end. Mr. John Fitzpatrick, president of the Dublin Trades Council, said that, as representing the local Society of Joiners, he had to complain of the Board of Works in Ireland in allowing the contractor who was doing work in the library of the Four Courts to get his joinery made in Portadown (where the wages were 28s. a week), and bring it to Dublin (where the wages were 36s. per week) to be fixed. His society held that this was a clear breach of the fair wages resolution. Complaint had been made to the Board of Works. Complaint had also been made to the War Office on the ground that soldiers were employed on joinery work in the Dublin Barracks, but replies had been received to the effect that by an Army order it was arranged that pioneers and engineers should do as much repairing in barracks as they conveniently could.

A VERY interesting departure in the construction of hospital wards is in progress at the Temperance Hospital in the Hampstead Road. This is nothing either more or less than a ward made of glass. The glass used is of an opaque white colour resembling porcelain with a high sheen. It is fixed in the shape of rectangular tiles about an eighth of an inch thick on a background of cement, and is "pointed" as bricks are when finished. The idea which is at the bottom of these glass walls is that the surface offers the least possible hold for the development and growth of microbes, and by turning on a hose they can be thoroughly cleansed with no trouble.

CONSIDERABLE surprise has been frequently expressed that up to the present no memorial has been erected over the tomb of Cardinal Manning at Kensal Green. This circumstance is now explained by the announcement that it is intended during the present year to remove the bodies of Cardinal Wiseman and Cardinal Manning to the new Westminster Cathedral now in course of erection. The ceremony

attending the removal will be of an imposing character, and the monuments erected over both Cardinals will be fully worthy of the prelates whose resting-places they mark. Cardinal Wiseman's monument cost many thousands of pounds, and will need little more than renovation.

As chairman of the Select Parliamentary Committee on Museums of the Science and Art Department, Sir John Gorst has received a memorial from a large number of distinguished Artists in the country, headed by Sir Edward Poynter. This document points out that the extraordinarily interesting collections at South Kensington Museum, which have been enriched by gifts and bequests valued many years ago at more than £1,000,000, cannot be properly arranged or seen, much less studied, owing to want of space, while the external appearance of the museum is a discredit to the nation. The memorialists, therefore, urge that active steps may be taken by Parliament to complete the building. In conclusion, they say: "We share the opinion already expressed that no more fitting national memorial of the sixtieth anniversary of the accession to the Throne of Her Most Gracious Majesty could be made than the completion of a museum which owed its existence to her Royal Consort, and which Her Majesty has declared that she has taken under her special and personal protection."

THE restoration of St. Bartholomew's Church in Smithfield, one of the oldest Churches in London, has now been completed, the work having lasted for a period of twelve years. The Bishop of London will re-open the Lady Chapel, which has for many years been occupied by a fringe factory, on May 18, and by way of celebrating the completion of the work a subscription luncheon will be held in the Great Hall of St. Bartholomew's Hospital.

SIR HENRY IRVING opened the Third Free Picture Exhibition at the Town Hall of Stratford last week. He had, he said, "a professional sympathy with pictures, for they were like strolling players, and these now before them had already fulfilled a successful engagement at Canning Town. Here at Stratford he was sure they would play to full houses. They had already enlarged the horizon of many minds, and done incalculable good by giving impressions of beauty to those who toiled amid conditions not always helpful to conceptions of the beautiful. They were true missionaries of civilisation ministering to that eternal need of the ideal which was as instinctive in us as the craving for material happiness. There had been a pretty hard struggle to obtain the national recognition of the duty of opening Art Galleries and Museums on the one day of the week which afforded rest and unrestricted leisure. They might congratulate themselves that no lingering prejudice could curtail the public enjoyment of that exhibition by treating Nature, and the artistic representations of Nature, as if they were doomed by original sin to turn their faces to the wall on Sundays."

THE funeral of the late Mr. Alfred J. Johnson, of John Street, Bedford Row, took place on Tuesday afternoon, the 4th inst., at the St. Pancras Cemetery, East Finchley. A number of his friends and brother members of his profession paid the last honours to one whom they mourn as a sincere friend and the soul of honour.

At the Royal Institution, Albemarle Street, the Rev. Dr. J. P. Mahaffy, Professor of Ancient History in the University of Dublin, recently delivered the first of a course of three lectures on "The Greek Theatre according to Recent Discoveries." The lecturer said the theatres at Pompeii were, he supposed, by far the earliest excavated, but we had no certainty that these theatres were not Roman. It was not till 1862 that by the efforts of the German, Strack, the site of the theatre of Dionysus at Athens was cleared, and we found out what this famous structure was in the last stage of its development. The lecturer proceeded to describe his first visit to it early in the seventies, remarking that its curved rows

of seats, the orchestra or flat centre, with its tessellated ornament, and the marble row of stalls around it, with the names of the official occupants, were unmistakable. There was something piquant in seeing the monumental evidence of the close connection of play-acting and religion; to see that what we might call the deans, canons, and prebendaries at Athens had their stalls, not in the choir of a church or temple, but in the front of a play-house, where not only solemn tragedy, but ribald comedy occupied the audience. The discoveries of other Greek theatres were next alluded to, and their ruins described with the aid of views thrown upon the screen. It was with these discoveries, he proceeded, that the comparative study of Greek theatres became possible, and it was to Architects that we owed all our greatest discoveries in connection with them. There was good reason to believe that the Greeks, so great in sculpture and in Architecture, were not great in music or in painting, and if nothing had been preserved in classical times but the music of the Greeks it would have been difficult to suspect their greatness in other fields.

THERE are many interesting features about the Imperial Victorian Exhibition opened at the Crystal Palace last week. Art is poorly represented, however. Its importance demands exclusive exhibitions, for in a show embracing so many phases of the progress of the Victorian era it would be impossible to do justice to so extensive a department. Thus the only exhibits coming under this head are a series of light sketches and a collection of cartoons. There are several models of old houses with overhanging fronts, and in them different industries are being carried on—joinery and pottery manufacture, for instance. A large model of a clock tower is being shown by Messrs. Gillett, of Croydon, and in the galleries two firms are exhibiting wall papers. Messrs. Jeffrey and Co. are showing special patterns of Victorian wall papers, and Messrs. Woodlams and Co. have a special wall decoration in leather which permits of very fine treatment. A prominent section of the Exhibition illustrates Victorian progress in shipbuilding, models of many of the greatest achievements in the Art being shown.

At Cardiff College the sanitary lectures were continued on the 1st inst. Dr. P. Rhys Griffiths, M.B., B.S., London, lecturer on hygiene and physiology, lectured upon ventilation, heating, and lighting. He showed how atmospheric air varied very considerably in courts, narrow streets, open spaces, in large manufacturing towns, and in the country, pointing out the nature and character of air in back-to-back houses. Then he described the various impurities found in the atmosphere, and referred to the several physical and chemical processes which gave rise to those impurities, mentioning the combustion of coal gas, candles, and oil, the decomposition of organic matter of many kinds, and the effects of the respiration of men and lower animals. Next he showed the various natural forces in nature which acted for the purification of the air, including plants, rain, and the ordinary movements of winds, and went on to deal with the amount of air which it was considered should be allowed to each individual in a living room. Discussing the natural and artificial agencies in the production of ventilation, he called the attention of the audience to the effect which fires in rooms had in this respect, and described desirable and undesirable inlets and outlets for currents of cold and vitiated air. Lastly, he described the method of practically examining the ventilation of any sort of building, illustrations being given on the screen by limelight.—Mr. Henry Seward dealt at length with the erection of buildings—such as hospitals, barracks, asylums, work-houses, &c. The best width for infirmary wards, he stated, was from 26ft. to 28ft. Dealing with the erection of houses, he explained how damp could be prevented, and recommended the placing of an inch or so of asphalt over foundation walls, and the erection of vertical air spaces.

IMMEDIATE application is to be made to the Standing Orders Committee of the House of Commons for leave to present a petition for a bill to extend the Victoria Embankment. It is proposed to form a company, with powers to make a new street commencing at or near the Victoria Tower of the Houses of Parliament, and terminating in the Horseferry Road at a point seventy yards or thereabouts to the westward of the western end of Lambeth Bridge; a new street from Great Peter Street opposite the Gas Light and Coke Company's premises to the new street at a point 250 yards north of Horseferry Road; a similar new street commencing to the eastward of the last-named and terminating by a junction with Horseferry road 150 yards from the south-east corner of the Gas Light and Coke Company's premises; and a new street commencing at the south-west corner of Victoria Tower Gardens, adjoining the Houses of Parliament, and terminating at the commencement of the proposed new Embankment. The bill also proposes the widening of Horseferry Road, Marsham Street, and Church Street, Westminster, and the construction of "an embankment or river wall with roadway thereon along the foreshore of the river Thames, commencing at or near the south-eastern corner of the Victoria Tower Gardens, adjoining the Houses of Parliament, and terminating at the western end of Lambeth Bridge."

THE curious underground houses of Techin and other places near Gabes, in Tunisia, are described by a traveller as being easily cut out of the clay-limestone rock. A square pit, 20ft. or 25ft. deep, is generally dug first to form a central court, from the lower part of which are made the grottoes that serve as sleeping and store rooms. A gently-sloping gallery rising from the level of the bottom to the level outside, and closed by a modern door, is the means of communication with the country without, or forms a part of other houses. Niches are cut in the walls of the entrance court for storage of the agricultural implements and things of minor value, and silos are provided for the grain crops and oil jars. The rooms are lighted only through the doorway from the entrance court. They are furnished with mats and carpets. A bed and a wooden pedestal for the lamp, rudely carved and whitewashed like the walls of the cavern, form the chief ornaments, and a few primitive utensils of enamelled earthenware are the principal articles of furniture. The size of the house and the number of rooms, &c., vary according to the wealth and station of the proprietor.

A LITTLE while back (writes a correspondent), without ceremony and almost unnoticed, a modest oaken monument was placed over the grave in Hampstead Parish Churchyard where, in their terra-cotta casket, the ashes of the late George Du Maurier were buried. The grave is situated only a few yards from the pavement of Church Row, close by the gates of the parish Church, and passers-by cannot fail to notice it. The monumental structure over the grave consists of a centre-piece supported by two uprights, carved in the form of ancient Celtic crosses. On the centre-piece is the following inscription, the last lines being the conclusion of "Trilby":—George Busson Du Maurier; born in Paris, 6th March, 1834; died in London, 8th October, 1896.

A most interesting apartment in Hampton Court Palace was recently thrown open to the public. It is Wolsey's private chapter, or oratory. This apartment leads out of the Mantegna Gallery, and corresponds in design to the Tudor portion of the Palace, the walls being panelled in oak to a height of 7ft. Above the panelling, occupying three sides of the room, is a series of sacred oil-paintings, which were restored under Sir J. C. Robinson's supervision. They represent "The Last Supper," "The Betrayal," "The Procession to Calvary," and "The Resurrection." The ceiling is decorated in a beautiful geometrical design, and the Cardinal's motto appears on the frieze. Among the devices are various Tudor emblems, especially the rose together with Prince of

Wales feathers and motto "Ich Dein," and competent authorities conclude, therefore, that the room was built during the period when Henry VI. was Prince of Wales.

THE great dome in the Champs de Mars, which was the pride of the Paris Exhibition of 1889, is being pulled down in order to make room for the greater glories of 1900. It took nearly a year to raise the massive iron framework, which contains a thousand tons of metal, and three months at least will be required to reduce the structure to its component parts, a speculator having bought the old material for a trifle more than 25,000*fr.* Mutability is the law which governs all human affairs, especially in France, and one is less surprised at the fall of this huge gilded plaything than at the fact that M. Bouvard, who designed it, will have the honour of setting up another in its place. The "Procession of Nations," painted in distemper on the walls, had been allowed to flake away, the gilding had given place to rust, and the vast hall was only used on rare occasions for vulgar and wearisome shows.

SAYS Mr. H. W. Brewer, in the Daily Graphic: "The little Church of St. Thomas, or, to speak more correctly, St. Thomas à Becket, Southwark, as seen at the present time, cannot boast of great antiquity, as it was entirely rebuilt about the year 1710. It is, however, of very early foundation, and was either built or rebuilt by the monks of St. Mary Overy's in 1213, after the great fire of Southwark, which destroyed the monastery and its magnificent Church, as well as London Bridge, and killed three thousand people. After this catastrophe the monks constructed buildings and erected a Church here, but it would appear that a kind of hospital, or almshouse, had existed previously, which was no doubt also destroyed by the great fire. Such an institution would be certain to have possessed either a Church or chapel. Probably the monks set up a temporary Church, as, after their return to their rebuilt monastery and Church, they appear to have turned their attention to the hospital of St. Thomas and its Church, which, with the assistance of Bishop Peter de Rupibus, they also rebuilt. There is some confusion about the matter, which may have arisen from the fact that there must have been three Churches or chapels dedicated to St. Thomas very near together—the Parish Church, the hospital chapel, and the chapel on London Bridge. When St. Thomas's Hospital was removed the Church was allowed to remain for the use of the parish, but as the parish has now been united to St. Saviour's, the magnificent, restored Church of which is amply sufficient for both, there seems every probability that the Church of St. Thomas will share the fate of so many of the City churches. It has been, however, suggested that it might be retained as a chapter-house for the collegiate establishment of St. Saviour's. St. Thomas's is a neat and well-proportioned building, with an elegant tower, constructed of brick with stone groins and dressings. It is decidedly worth preserving, if this can be done without any very great sacrifice, as it is a valuable landmark of old Metropolitan history."

AT Manchester the Duke of Devonshire has opened an exhibition of pictures and other objects illustrative of the Tudor dynasty, which have been collected by the committee of the Manchester Art Gallery. His Grace, in reply to the toast of his health given at luncheon, spoke of the leading part taken by Manchester in the promotion of loan collections of Art, beginning with the great example set at Old Trafford forty years ago. The Tudor exhibition was of a kind that must, not only from an artistic but from an historical point of view, lead to most instructive and interesting comparisons. When they saw the portraits of those who lived in bygone times and the pictures of the scenes in which they acted—when they were brought into direct contact with the relics and mementoes of those times—they were put into touch with men and events, and the actors in those

periods spoke to them directly, and not through the medium of the theories or prejudices of the literary historian.

THE Chantrey Trustees have bought Miss Lucy Kemp-Welch's large picture, "Colt-hunting in the New Forest," and Mr. David Farquharson's "In a Fog." In the sculpture gallery at Burlington House their choice has fallen on Mr. Pomeroy's marble statuette, "The Nymph of Loch Awe." The purchase of Mr. Napier Hemy's "Pilchards" has been already announced; but this detail may be added—that the sum of £1250 paid for it is the largest the Chantrey Trustees have yet spent on the work of an outsider. Miss Kemp-Welch, who is a pupil of Mr. Herkomer, receives £525 for her large canvas.

REGISTRATION Bill of the Plumbers' Company has passed its second reading in the House of Commons and been referred to the Standing Committee on Trade. There is, therefore, good reason to believe that it will become law this session. That this anticipation will be realised is devoutly to be desired in the interests of the general health of the community. Already the registration movement has been productive of great good, and there can be no doubt that when it has received Parliamentary sanction it will prove still more beneficial, and be the means in time of entirely revolutionising the conditions under which this important trade is carried on.

AT Rouen a novel kind of bridge, unlike anything yet seen in either France or England, is being erected over the Seine. Three-quarters of a mile below the lowest of the two existing bridges, it will not interfere in any way with the passage of ships, even of those with masts 150*ft.* high. "I shall perhaps give the best general idea of its appearance," writes the British Consul at Rouen, "by saying that two diminutive Eiffel towers are to be erected, one on each river bank, and that a narrow iron bridge will be suspended by chain cables between their heads. This bridge, which will be not less than 160*ft.* above the level of the quays, is not, however, intended for the passage of carriages, or even foot passengers. Several lines of rails will be carried along it, and upon these lines a skeleton carriage or platform on wheels will run. This will be dragged from side to side of the river by steel ropes passing over a driving wheel, to be worked by a steam or electric engine upon one of the banks. To the skeleton platform will be hung by steel hawsers, at the level of the quays, or 160*ft.* below the bridge, the 'Transbordeur.' This 'Transbordeur' is the slung carriage within which passengers and carriages will be transported from one bank to the other. It will be of solid construction, and not less than 13 metres in width by 10 metres in length. As by the time the 'Pont Transbordeur' is completed the electric tramways will be running on the south quays of the river, as well as on the northern, it is intended to make a connection between the lines at this point, and the 'Transbordeur' will be fitted to carry the tramcars, so that passengers by them will cross the river without changing their seats. I believe that over only one other river in Europe a similar mode of transport has been adopted, that is over the Nièvrion a little distance below Bilbao. Unlike most such works in France this has been left to private enterprise, and it will be carried out by M. Arnodin, of Châteauneuf-sur-Loire, who is also the patentee. It will cost the Municipality of Rouen nothing, but they grant the concessionaire a monopoly for eighty years of the bridge traffic over the Seine at this point according to a very moderate pre-arranged tariff. Foot passengers are charged only 5*cs.*, animals 5*cs.* to 10*cs.*, carriages from 10*cs.* to 25*cs.*, and a tramcar weighing not more than five tons will be carried from bank to bank for f.1. The work is already commenced, and the outside time allowed for its execution is eighteen months. It will bridge the Seine at the foot of the Boulevard Couchoise."

VARIOUS rumours have been circulated at Penzance and Scilly since the Government announced its intention to spend a sum of

money with a view to make the Isles of Scilly available as a naval coaling station. The position, however, appears to be a very simple one. The islands are now the property of the Duke of Cornwall, although for a great number of years they have not been administered by the Duchy authorities, but by private leaseholders. A new lease was granted to the present proprietor, Mr. T. A. Dorrien-Smith, some three or four years ago. It is believed that the Government proposes to purchase the freehold from the Duchy, and then to grant a new lease to Mr. Dorrien-Smith. The Government do not contemplate fortifying all the islands, the main object being to make Scilly a coaling station. For this purpose it is understood that the island of Stampson will be utilised, and strongly fortified, and possibly masked batteries may be put on some of the other islands.

AT the Society of Arts on the 6th inst. a paper on "The Railway to India" was read by Mr. C. E. D. Black. The chair was taken by Sir F. J. Goldsmid. Mr. Black assumed that we should always cleave to the Mediterranean route, and said that a straight line drawn as the crow flies from the northern end of the Suez Canal to Kurrachee, or whatever might be fixed upon as the western land gate of India, coincided with the route which he regarded as the shortest and best line for a railway to India. It was only after a long process of study and elimination that he arrived at the conclusion that the scheme he now put forward was the best. The route would be from Port Said eastward across the peninsula of Sinai to the Gulf of El Akabah, and thence, following the 30th parallel of latitude, to Bussorah. A branch would deviate a little to the south of the port of Grane or Koweit, which, it might be remembered, was the terminus of the Euphrates Valley Line, on which a Select Committee of the House of Commons sat twenty-five years ago. From Bussorah the main line would cross the Shat-el-Arab and Karun rivers by swing bridges, and follow the coast line of the Persian Gulf and Makran to Kurrachee. The Persian and Baluch sections could be constructed along the coast, and, in case of war, defended by the guns of our fleet. The Arabian section was defended by Nature from aggression. A great advantage of this railway would be the possibility of establishing a depot for the Indian troop relief at a suitable and fairly elevated station near the northern end of the Suez Canal, between Port Said and the Syrian frontier. Such a new Mediterranean station would complete the chain of Gibraltar, Malta, and Egypt, a chain which at present was very shaky, so far as the Egyptian end was concerned, and liable to be entirely interrupted if the Suez Canal were blocked.

MR. SYDNEY A. SMITH, the winner of the Penfold silver medal for being highest on the list, and also the Driver prize for conspicuous merit in the Professional Associate Examinations of the Surveyors' Institution, is just twenty-one years of age, and probably the youngest candidate in the non-student division. He has seen some excellent experience in the offices of Messrs. Ernest George and Yeates, Mr. J. R. Thornton, and Messrs. Weatherall and Green.

THE 400th anniversary of Cabot's discovery of the North American mainland is to be commemorated in Bristol by the erection of an observatory tower on Brandon Hill at a cost of £3000.

AN inquiry was recently held at Gildersome respecting the application of the Urban District Council to the Local Government Board for sanction to borrow £2500 for purposes of providing Council accommodation, recreation-ground, &c.

THE Chatham Town Council has accepted a tender at £20,598 for building a town hall, on a site at the foot of Military Road, in that town, which has been acquired from the War Department. Another contract will be entered into for furnishing and fitting the building.

## A TOUR IN HOLLAND.\*

By J. B. MITCHELL WITHERS.

(Continued from page 185.)

DORDRECHT (Dort) was one of the principal towns in Holland during the latter part of the Middle Ages. Here in 1618-19 was held the Synod of Dort, to settle points between the religious sects of the Armenians and Calvinists. The timber rafts from Germany are broken up here. The Groote Kerk is a conspicuous object, grouping well with the quaint gables, and many of the bits are very picturesque, and the river adds much to its charm. In the Groote Kerk at Gouda may be seen a set of twenty-eight fine old stained glass windows, painted between 1555 and 1603. Delft is a sleepy city, but well worth a visit. Its principal buildings of interest are the Stadhuis in the Groote Markt, built about 1618; the Prinsenhof, where William, Prince of Orange, was assassinated in 1584. There is also a fifteenth century Oude Kerk, in which is a monument to Admiral Tromp, who inflicted such damage on the English that he sailed with a broom attached to the masthead down the Channel to show he had swept them from the seas; and a fourteenth century New Kerk containing a monument to William, Prince of Orange. The gate-houses are interesting. The Hague has been the political capital since the sixteenth century, and is the most fashionable city in Holland. Originally it was a hunting seat of the Counts of Holland, and, though jealous of other Dutch States, was treated simply as a village, having no municipal or Parliamentary rights till Louis Bonaparte was king. The Vyver (fish pond) in the centre of the town is very interesting. Leyden is the

## UNIVERSITY TOWN OF HOLLAND,

and stands on islands formed by the Rhine. It is famous for the siege it withstood in the sixteenth century while the inhabitants waited for the Prince of Orange to fulfil his promise and come to their relief. This was eventually done by the dykes being cut, and the Prince's fleet sailing into the town, bringing provisions. William afterwards established a University to commemorate this event, and for a long period of time it was the most famous University in Europe. The Town Hall, or Stadhuis, is in the Bredestraat, and is worthy of notice, being a fine sixteenth century building. There is an inscription on it: "When the black famine had brought nearly six thousand people to death the Lord God repented, and gave us as much bread as we wanted." The Church of St. Pancras, which was built in the fifteenth century, contains a monument to the Burgomaster Van der Werff, who held the town during the siege. At Haarlem the Groote Kerk (St. Bavo) in the market-place is said to be one of the finest in Holland. These Dutch Churches of the early painted periods, as I have already mentioned, were influenced by the work carried on in Germany, and bear a strong resemblance to those on the lower Rhine, but with different materials; for instance, the roofs would be constructed of wood (in this case cedar), and the walls with brick. The carved oak pulpit, brass rail, and fine brass screen are worthy of notice, as is a trophy in memory of the Crusade of Count William I., composed of model ships hung from some of the arches. Amsterdam is on an arm of the Zuyder Zee and the river Amstel, and the houses are built on piles driven down into the sand. No description of Amsterdam would be complete without some reference to the Ryk's Museum. Of this set of collections now under one roof, the chief is the Dutch pictures, which bring visitors from all parts. But there are many other objects of great interest; for instance, a set of rooms, perhaps about half size, furnished and set out to show the old sixteenth, seventeenth, and eighteenth century rooms in different parts of the country, Delft ware, painted glass, chimney-pieces, furniture carving, ironwork, reproductions of old ceilings,

&c. The great Church is one of the best churches in Holland, and contains some interesting monuments. The pulpit with its large sounding board elaborately carved is good. The Ouda Kerk has some fine stained glass windows. The old weigh-house is also interesting; in front of it is one of the markets. Other markets are also shown in the following illustrations. The Montel Baens tower is also an interesting object. It is built of red brick, and used as a watch-tower and beacon. Alkmaar is what is called one of the dead cities, owing to these cities having been at one time of much more importance in the country than they are to-day. It is now specially famous for its cheeses, which are brought from the surrounding neighbourhood and sold in its market. Its sixteenth century weigh-house is a very striking and picturesque old building. It is in the market square. The old houses are also, as usual, most interesting. Hoorn was once the capital of North Holland, but is now of much less importance. In it there are many houses of the sixteenth century. Some of the old gates also remain, and its weigh-house and harbour tower are well worth attention.

## KEYSTONES.

THE design of Professor Eberlein, of Berlin, for the monument of the late Duke Ernest of Saxe-Coburg-Gotha, has been accepted by the committee. The first stone will be laid shortly.

At Halifax the Gas Committee of the Town Council has decided to recommend the Council to sanction the construction of a new holder, with a capacity of 6,000,000 cubic feet, at an estimated cost of £40,000.

The new Dublin Fish Market erected by the Corporation in St. Michan's Street, directly facing the western side of the new vegetable, fruit, and fish market, was opened yesterday by the Lord Mayor of Dublin.

The Carlisle Town Council has decided to erect a number of workmen's dwellings, at a cost of £2250, and to have plans prepared for a scheme for lighting the town with electricity, the cost being estimated at £25,000.

At West Norwood last week the Centenary Hall and new wings of the Jews' Hospital and Orphan Asylum were opened by the Duke of Cambridge. The wings have been extended 60ft. rearwards, there is a new story to the main block, a new dining-hall and kitchens, and other improvements.

The Special Committee appointed by the Corporation of Sunderland to consider the proposal to construct another bridge across the Wear from Deptford to Southwick has decided to consult a competent engineer as to the probable cost of a new bridge. After this has been done, the matter will be considered by the committee and the Southwick Urban District Council, and a report submitted to the County Council.

We have received from Messrs. Darlington and Co. a list of the new editions of their handbooks to North Wales, the Channel Islands, Isle of Wight, South Coast, the Wye Valley, Severn Valley, Bournemouth, and the New Forest, Bristol, Bath, &c. One and all of the handbooks have been thoroughly revised, and are replete with information as interesting as it is accurate. The subjects are exhaustively dealt with, and the tourist will find little or nothing lacking in Messrs. Darlington's publications.

At St. Leonards a new convalescent home, which has been built in connection with the Railway Mission, was opened last week. The building occupies one of the healthiest spots at the extreme west of the town. It takes the place of a small house in an obscure part of Hastings, which has for five years been used for convalescent railway men. Quite a palatial home has now been built at a cost of £7000. The building is well-fitted with every convenience. There are rooms for the lady superintendent, a library, the secretary's office, and a spacious dining-hall, adjoining which is the kitchen. There are also a doctor's consulting-room and cloak-rooms on the ground floor. On the first floor are bedrooms, bathrooms, &c.

## Professional Items.

ABERDEEN.—The Plans Committee of the Town Council has approved of the plans of the following:—Alterations in connection with granite works on the south-east side of Cotton Street, for Messrs. Simpson Brothers; additions at the rear of No. 14, Roslin Terrace, for Mr. George Bisset, per Mr. John Rust, Architect; alterations and additions in connection with the house No. 12, Bon-Accord Square, for the Misses Lunan, East Craibstone Street, per Messrs. Walker and Ross; cycle shop on the west side of King Street, for Mr. James Milne, per Mr. Harvey Mennie, Architect; store on the south-west side of Old Ford Road, for the Aberdeen Machine Firewood Company, per Messrs. Brown and Watt, Architects. The committee approved of the following plans, on condition that the size of the water pipes and the position of the water cisterns are fixed by the burgh Surveyor: Two dwelling-houses on the east side of Balmoral Place, for Mr. John Cameron; dwelling-house on the north side of Devonshire Road, for Mr. William M'Innes.

ALLERTON.—A new club is being erected at Allerton at a cost of £1200, exclusive of site and furnishing. The new premises will occupy a central position on the Allerton Road. The style adopted by the Architects is the Domestic Gothic. On the ground there will be a committee-room, a card-room, and a reading-room. From a spacious entrance-hall a good wide staircase gives access to the first floor, occupied by the billiard-room. A caretaker's house is attached to the club premises.

BALBY, NEAR DONCASTER.—The chancel window of the Parish Church has been filled with stained glass with the subject of the crucifixion, with figures of the Virgin and St. John occupying the three lights; the south window of the chancel, as a memorial to the late Vicar, and the window in the south aisle near the pulpit with figures of the "Good Shepherd" and Christ as "the Light of the World." They are from the studio of Mr. T. W. Camm Smethwick, near Birmingham.

BATH.—At a meeting of the Building Committee appointed in connection with the Art gallery scheme at Bath, Mr. Hallett and Mr. Morris said subscriptions were not coming in in consequence of the attitude taken up on the question by an Architect. Mr. H. O. Wills, the donor of £1000, wrote that he was utterly indisposed to contribute anything towards the expenses of a competition for designs—as resolved by the general committee—and said that all now wanted was to ask Mr. Brydon to finish his design. The following resolution was carried unanimously:—"That the Building Committee having before them the financial and other facts of the case of the Art Gallery and Library, and the objections of large contributors to the delay and expense of premiums, consequent upon recourse to general competition, respectfully recommend the General Committee to empower them to employ Mr. Brydon as Architect for the erection of the building."

BIRMINGHAM.—An important improvement in the centre of the city, in view of the erection of the new General Hospital and the proposed extension of the tramways, is the widening of Steelhouse Lane, a subject which has been discussed by the Improvement Committee on several occasions. Loveday Street, which forms the boundary on the lower side of the hospital, has already been widened on the average by about 12ft., and the lower part of Steelhouse Lane is in process of being broadened by an additional 15ft., the whole work involving an outlay of upwards of £2000. This improvement has once more drawn attention to the narrow part of Steelhouse Lane between Bull Street and the rear of the Victoria Courts. It would be a considerable advantage if that portion of the thoroughfare were broadened to the extent of about 15ft., so as to give the street a uniform width of about 45ft. The cost of this under-

\* A lecture delivered to the members of the Sheffield Society of Architects and Surveyors.

taking would be probably about £3000. The matter will be brought forward for further consideration at an early meeting of the Improvement Committee.

**BRADFORD.**—In connection with the movement for restoring the Bradford Parish Church as a memorial of the late Archdeacon Bardsley, a special meeting of the General Committee appointed some time ago was held recently. It was carried unanimously that the plans prepared by Messrs. T. H. and F. Healey, Architects, be approved. The plans selected provide for the removal of the galleries, a certain amount of compensation of sittings being secured by the addition of two transepts and the freeing of the Bolling Chapel for worship by the erection of vestries. A second resolution was proposed by Mr. John Ambler, seconded by Mr. G. S. Carr, and carried, to include in the faculty which it will be necessary to obtain provision for rebuilding the south, or Church Bank, side of the Church, and the restoration of the north side of the edifice. The estimated cost of the scheme approved is about £4000.

**BURLEY, LEEDS.**—During recent years no district within the Leeds city boundaries has been developed more rapidly than that of Burley. The population of the locality has increased enormously of late, and is still growing rapidly. A commencement has been made with a new Wesleyan Chapel, and the foundation stones were laid on the 1st inst. The site is in Cardigan Lane. At present this is only a narrow, inconvenient road, but it is said that the Corporation intend to widen it. The premises have been designed by Mr. G. F. Danby, Architect, of Leeds. They comprise a chapel, schoolroom, infants' room, Church parlour, minister's room, and twelve vestries, or class rooms. The style of Architecture adopted is the Decorative Gothic. The chapel is being built of stone, lined with brick, while all the internal woodwork will be of pitch pine. A leading feature of the front elevation will be a double doorway with granite columns, carved capitals, and moulded arches, terminating in a gable. Over this there is to be a five-light tracied window. At the south-east corner a tower and spire will rise to a height of 110ft. The chapel is to be 84ft. long, 48ft. across the nave, and 57ft. across the transepts. Accommodation will be provided for 480 persons on the ground floor, and for 320 in the gallery. The open-timbered roof will, in the centre, rise to a height of 40ft. The contracts at present let amount to about £6000. The contractors are: Mr. C. Myers, masonry; Messrs. Ledgard and Son, joinery; Mr. H. Boston, plumbing and glazing; and Messrs. J. Atkinson and Son, slating.

**BURNLEY.**—The new Church of St. Catherine, which has been built in Todmorden Road, was consecrated by the Bishop of Manchester on the 4th inst. This is one of three additional Churches which are being provided, largely through the liberality of the Rector of Burnley. The total cost of St. Catherine's Church is £8150, and already £7000 has been raised. The Church has been built from the designs of Mr. Medland Taylor, of Manchester, and is of rather unusual design owing to the shape of the site being a truncated triangle and the owners of adjoining land having rights of light over it. Altogether, the Church will seat about 700 people.

**CARDIFF.**—At a meeting of the Electrical Committee, the electrical engineer (Mr. Applebee), in conjunction with Mr. Harpur (the borough engineer), presented a report upon the extensions of the Cardiff electrical system. In his report, which dealt with technical details, Mr. Applebee stated that when the extensions now in hand are completed there will be a capacity of 17,000 8 c.p. lamps. In the engine-room of the new block could be fixed three machines, which would bring the total capacity to 50,000 lamps, provided they used plant such as Messrs. Ferranti are now making. The report recommended the committee to adopt and to use a pressure of 200 volts. It would necessitate an overhaul

of all the existing wiring, and supplying the consumers with a new set of lamps to suit the 200 volt pressure. The alternate current transformers would need but very little alteration, as all which have been purchased since 1895 are so arranged that they can be used at 100 volts or 200 volts as occasion requires. The cost of doing all this will be very considerably less than duplicating the mains and auxiliary apparatus.

**DUNBAR.**—The Parish Church, which has just undergone extensive alterations and improvements, was built seventy-seven years ago. In external design it is a very fair example of what could then be accomplished at that early period of the revival of our ancient Gothic Architecture. But the moment one passed into the interior it was thoroughly disappointing—a large square space with a gallery all round. As a better knowledge of Ecclesiastical Architecture spread, it was felt more and more that the interior of the Church was quite out of keeping with its beautiful exterior. In February of last year contracts were entered into with Messrs. Hall, of Galashiels, and others, and building operations at once commenced. The whole of the interior has been removed, and the area sub-divided into nave and aisles by means of stone arcades of five arches each. A semi-octagonal apse has been thrown out at the east end, opening into the nave with a chancel arch of moulded stonework, having a minister's vestry on one side and an organ chamber on the other. The fine old pulpit of the Church has been retained, and placed against the south jamb of the chancel arch, the baptismal font occupying a corresponding position at the north jamb, with the Communion-table between, on the centre of the apse. The splendid Dunbar monument now stands on the floor level of the Church, against the east wall of the north aisle, completely restored, and has never been seen to such advantage since the day of its erection 270 years ago. Gas has been introduced, the nave being provided with eight corona lights, and a large one of burnished brass hangs from the apse ceiling over the Communion table. The whole of the work has been executed from the designs and under the supervision of Messrs. W. and J. Hay, Architects, of Liverpool. The contractors for the mason and joiner work were Messrs. Robert Hall and Company, Galashiels; for the slater and plaster work, Messrs. Archibald Aitken and Son; for plumber, gas-fitting, and heating apparatus, Messrs. Melville and Son; for painting, Mr. Mackenzie—all of Dunbar; and for glazing, Messrs. George Lindsay, of Edinburgh. To Mr. W. G. Stevenson, E.S.A., was entrusted the work of taking down and reconstructing the Dunbar monument. The two stained windows were taken out and replaced by Messrs. Ballantine and Gardiner, of Edinburgh. In place of the old cracked bell, one of nearly double its weight has been provided by Messrs. Bryden and Son, of Edinburgh. The cost of the whole work will be somewhere about £4500.

**EDINBURGH.**—Cable-power stations are to be erected at Tollcross and Shrubhill in connection with the extension of the cable system of tramways throughout Edinburgh, and the Corporation has now entered into contracts for the necessary work. The site of the power-station at Tollcross is about an acre in extent, and cost £17,485. In order to provide for the formation of the necessary stable foundations for the engines and driving machinery, the site is being excavated to a depth ranging from seven to twenty feet, under contract, let to Messrs. Andrew Waddell & Son, amounting to £3363. The contract for the buildings amounts to £36,800, and has been let to Mr. Colin Macandrew, Lauriston. The whole is to be completed within nine months. The buildings, which are partly of one story and partly of two stories, with basement, are in three sections: the boiler-house, coal store, chimney, &c., on the north, next Fountainbridge; the engine-house and accessories in the centre; and the car storage sheds to the south, which will form the front of the buildings. Underneath the latter is formed the subways for the cables, tension races, &c. Messrs. W. M. Colan

and John Cooper are the Borough Engineers who are superintending the works.

**FORMBY.**—The new home for infants at Formby has just been formally opened. The building is a plain substantial one, and is situated in Andrew's Lane, a few minutes' walk from the station. On the ground floor there is a large recreation-room, a commodious dining-room, matron's quarters, kitchen, scullery, pantry, laundry, washhouse, and usual outbuildings. Upstairs there is a large dormitory containing eighteen beds, a smaller one containing twelve beds, and a ward for sick children with four beds. There is also the matron's room and the servants' bedrooms. The building was designed by and the contract carried out under the personal superintendence of Mr. J. H. Havelock Sutton, of Liverpool and Formby, and the work was executed by Messrs. J. and G. Chappell, of Walton Village. The home has cost about £2000.

**HARROGATE.**—A public meeting, presided over by the Mayor, was recently held for the purpose of ratifying or otherwise a resolution passed at a preliminary meeting, deciding that the local scheme should be in aid of a School of Art and a Museum. Mr. C. T. Meyer moved the adoption of the resolution passed at the preliminary meeting in favour of the School of Art and Technical Education, which he considered would be characteristic of the Victorian era.—Dr. James Myrtle seconded.—Mr. W. H. Breare suggested an attempt might be made to purchase the plot of ground in front of the Prospect Hotel.—The resolution was agreed to.

**KILKENNY.**—The foundation-stone of the new Church of St. John at Kilkenny has been laid. The cost of the building will, inclusive of its tower and spire, be close on £30,000, all of which the Loughlin family have undertaken to defray. Mr. Wm. Hague has prepared the plans, which show a large central front porch beneath a tower of massive proportions, flanked by two other porches for access to aisles, nave 90ft. by 30ft. 3in., aisles each 96ft. by 15ft., sanctuary and apse 43ft. 3in. long by 27ft. 6in. wide, side chapels 30ft. by 13ft. 6in., and sacristies 35ft. by 16ft. 6in., beneath which are store-rooms and heating chamber, and space for vaults. Adjoining the aisle porches are the baptistery and a votive chapel. The tower is 25ft. square externally, and the total length from inside of tower front wall to inside wall of apse is 152ft. 6in. by a width across nave and aisles of 60ft. clear. The design is Gothic of the Middle Pointed period. There are three entrances to the Church, the main one in the centre of the tower being deeply recessed, as are the other two, with granite shafts in jambs having moulded caps and bases, with richly moulded arches and labels and flowing cusping in head of the great doorway; the latter having spandril tracery panelling and pierced parapet, surmounted by a large bold tracery window 25ft. high, with ogee crocketed label and finial. Three light tracery windows are in the gables of side porches placed within recessed arches. The aisles are lighted by single light tracery windows in the alternate bays, with recessed confessionals, which are treated in a quaintly fashioned arcade with canopies between the buttresses. Externally the apse is lighted by eleven tall wide single lights, with double tracery and cusping in heads designed to receive stained glass. The clerestory windows are of two lights with suitable elaborate tracery, having buttresses between each. The tower is arcaded and pierced above the large window, over which is the belfry stage, 30ft. high, having in each face double light windows with mullions and open tracery and ogee crocketed canopies. The base of the spire has an open-pointed, arcaded parapet, with granite shafts and clustered crocketed pinnacles at each angle, running up to the termination of the broaches forming the octagon of spire, whence the latter rises until a height of 235ft. is reached from the ground to the top of the bronzed and gilt cross surmounting it. Buttresses are introduced at each bay of the aisle between the windows, with tablings one on each side, being carried up with weathered

canopy. The interior is arcaded in moulded stone, springing off carved caps resting on moulded granite columns, which, in turn, are seated on marble moulded cases with granite plinths. The ceilings throughout will be groined and richly moulded. The floors are of wood and mosaic marble pavements. The height from floor to apex of roof of nave is 70ft. The contract has been placed in the hands of Mr. Stephen Lalor, of Kilkenny.

**MAESTEG.**—The foundation-stone of North's Memorial Hall was laid on the 4th inst.; and on the same day the new Central Schools were opened. The total cost of the new buildings constituting the memorial, when completed, will be about £1500. They will be of two stories, and will consist of a large library, reading-room, committee-rooms, and billiard-rooms. The main room will be 58ft. by 29ft. The entire structure will be of dressed native stones, with pilasters of brick margin and gorilla panels. The site is opposite the Town Hall on the Maesteg Uchaf estate. The new Central schools are on the same estate, and the School Board has a leasehold occupation for a term of 99 years from North's Navigation Company. The new school buildings afford accommodation for 1016 children, and consist of boys', girls' and infants' departments. The contractors of the schools and the Memorial Hall are Messrs. Rattray and Jenkins, and Mr. E. W. Burnett, Töndu, is the Architect. All the rooms are ventilated by Boyle's patent ventilators, and heated by Shorland's patent grates.

**NEWCASTLE.**—At a meeting of the members of the Town Improvement Committee a deputation of property owners and residents in Osborne Avenue, Jesmond, attended with a request in regard to the repaving of the Avenue. They desired that instead of chips, there should be laid asphalt, so as to prevent the noises made by vehicular traffic, especially at night. The Committee decided that that part of the Avenue where it was intended to lay down chips, should be attended to as requested by the deputation. With regard to the roadway on the bridge in New Bridge Street, it was felt that it was highly expedient that something should be done in improving it. It was decided to recommend the City Council to urge upon the Railway Company to make the extension as originally proposed as soon as possible.

**OXENHOPE.**—A series of foundation stones were recently laid in connection with the proposed new Wesleyan Sunday School at Oxenhope. The school will occupy a site to the west of the present chapel, and will take the place of premises which are too small. The new buildings will consist of an assembly-room 40ft. wide, 26ft. high, and 54ft. long, a gallery 24ft. deep, an organ recess, library, lecture-room, infants' schoolroom, and other rooms. The site has cost £600, and was paid for some time ago. The outlay on the buildings is expected to be £4200.

**PATRICK.**—Plans were passed at Patrick Dean of Guild Court for the erection of a new U.P. Church at the corner of Lawrence Street and Alexandra Street, Dumbarton Road. The new building, which is to cost £6000, will be about 69ft. by 57ft., and have seating accommodation for 834 persons. Over the session-house there will be a hall 28ft. by 58ft., and altogether as shown in the plans the building promises to be rather a neat one in appearance.

**PENARTH.**—The new Sunday Schools erected in connection with Trinity Wesleyan Church at Penarth have recently been opened. The main hall and galleries will seat 500, and opening out from the hall is an infants' school, with accommodation for 150, fourteen class rooms, a library, and a large Church-hall, capable of seating 100 persons. The total cost has been about £2600.

**SHIREBROOK, DERBYSHIRE.**—The Shirebrook Colliery, Limited, which has just reached coal at a depth of 540 yards, is building a village for the workpeople at Shirebrook, Derbyshire.

Contracts for 150 houses have been let, and houses are rapidly being erected from plans drawn by Mr. J. Perkin, Architect, of Leeds and Shirebrook.

**SHOREDITCH.**—Baths and washhouses are to be erected in Pitfield Street, Hoxton, and the foundation stone was laid recently by the Chairman of the Shoreditch Vestry. The first-class swimming bath will be 100ft. by 40ft.; the second-class swimming bath somewhat smaller; there will be many slipper baths, besides accommodation for 50 washers. The site and building would cost £31,093. Mr. James Stuart, M.P., said the baths would represent part of a block of municipal buildings which would include a library, an electric lighting station, and a dust destructor.

**STOKE-ON-TRENT.**—The new schools at The Mount, Penkhal, Stoke-on-Trent, were opened on the 3rd inst. The house has now been converted into the administrative department of the new Blind and Deaf Schools, the stable range to the northwards being the only part destroyed. The new buildings have been added to the rear of the house eastwards for the deaf children, and southwards for the blind. There is accommodation for 139 children, and the necessary teaching and servant staff.

**STOURBRIDGE.**—The committee appointed at the recent town's meeting to carry out the scheme for erecting a technical institute has decided to acquire for the purpose a site in Worcester Street, adjoining the ground on which the Stourbridge Dispensary stands. The Technical Board have raised £707 towards the cost, and there is a County Council grant of £600 to come in. Since the Town Committee was formed £286 additional has been promised, and a general appeal is about to be issued for additional subscriptions to carry out the scheme.

**STOURTON.**—The corner stone of a new Episcopalian Church has been laid at Stourton. The building is to take the place of St. Andrew's Mission Church, which has become too small to meet the requirements of the district. The new Church will be of the late fourteenth century style of Architecture. It will be a brick building, with red Dumfries stone dressings on the outside, and a roof of red Staffordshire tiles. The dressings in the interior will be of Harehills stone. The Church will consist of a nave and aisle, chancel, organ chamber, vestry, and heating chamber. On the north side there will be a small chapel, providing accommodation for about twenty-five people. An octagonal turret will rise from the north-east corner of the nave. The aisles of the Church are to be divided from the nave by two arcades of five arches each. Above these there will be a range of three-light, traceried, clerestory windows. A large five-light east window and clerestory windows on the north and south will light the chancel. The main entrance to the Church will be at the north-west corner. There will also be doors at the north and west ends of the building. The chancel ceiling will be arched and panelled, and the roof of the nave will also be subdivided into panels. A floor of wood blocks, deal seats, and an altar made of oak complete the building. The estimated cost, including extras, is a little over £5000. Mr. Hodgson Fowler, of Durham, is the Architect, Mr. T. A. Bolton, of York, clerk of the works, and Mr. Isaac Gould, the contractor.

**TAYPORT.**—A mission hall has been opened in Tay Street capable of accommodating about 250. It is neatly and substantially built of brick, and off the main hall is the ante-room, which is also large and commodious. Out-houses have also been erected. The hall is well lighted, and the acoustics are excellent. The contractors for the work were Mr. David Robertson (who completed the mason and joiner work); Mr. W. Ferrie, plasterer; Mr. A. S. Jack, Newport, plumber; Messrs. Dewar and Lindsay, painters; Mr. John Storrier, Newport, slater. The total cost, including site, will be about £300.

## Trade and Craft.

### THE MIDLAND CANAL SCHEME.

The exhaustive report of Mr. Marten on the proposal for improving the water communication between Wolverhampton and Birmingham and the Bristol Channel seems to bring the long-cherished dream of converting these Midland centres of industry into ports within a measurable distance of realisation. Canals wide and deep enough for sea-going ships are rather costly luxuries, and when the waterway in question is required to extend over a distance of a hundred miles, one is apt to renounce the scheme as impracticable for private enterprise. But it is well to remember in the first place that vessels to be provided for are not ocean liners, but special barges of very modest proportions, and that the waterway has not to be constructed, for it exists already, but only to be deepened and widened. There is no danger, therefore, of the Bristol waterway scheme turning out a new Manchester Canal trap or Panama fiasco. Engineers' estimates in these cases are seldom very exact, but by no conceivable rectification of details could Mr. Marten's demand for £360,000 run into millions.

### CAST IRON PIPES FOR CHRISTIANA.

The Secretary of State for Foreign Affairs has received a dispatch from H.M. Consul-General at Christiana, stating that tenders are invited by the Christiania Gas Works for the supply of cast iron pipes. Tenders must be drawn up in accordance with the stipulated conditions of delivery, which can be seen at the Christiania Gas Works Office, and must reach that address in sealed envelopes marked "Ambud til Christiania Gasvoerk," before the 15th of May. Some further particulars may be seen at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 6 p.m.

### BUILDING TRADE WAGES IN YORK.

During the past three months the York Master Builders' Association and the men's unions have been interchanging negotiations with reference to the advances of wages demanded by the men. On February 1st last, Messrs. T. Rawling and George Sharp, the joint secretaries of the York Master Builders' Association, were served with notices on behalf of the bricklayers, bricklayers' labourers, plasterers and plasterers' labourers, asking for an advance of wages. The bricklayers asked for an increase from 8d. to 9d. per hour, the bricklayers' labourers for an advance from 5½d. to 6d. per hour, the plasterers from 8d. to 9d. per hour, and the plasterers' labourers from 5½d. to 6d. an hour. In accordance with the code of rules in operation between the masters and the men, three months' notice was given. This expired on May 1st, but in the meantime the bricklayers had withdrawn their request for an increase. The Master Builders' Association has resolved to grant the plasterers an advance from 8d. to 9d. per hour, and has also agreed to accede to the request of the bricklayers' and plasterers' labourers for an increase from 5½d. to 6½d. per hour on condition that they undertake not to make a further application for an advance next year.

**MESSRS. SMITH, BRODRICK, AND LOWTHER,** Architects, notify us that they have removed their offices from Logan Chambers, Hull, to York Chambers, 77, Lowgate, Hull.

It is proposed to add increased hospital accommodation at the Cork Asylum, and we understand Mr. S. A. Roberts, the Architect to the Board of Control, has prepared a series of alternative plans for the guidance of the Governors.

The huge pavilion that is to be erected in St. Paul's Churchyard for Mr. Maskelyne has been designed by Mr. James G. Buckle, of York Buildings, Adelphi, and not by Professor Banister Fletcher, as recently stated. The accepted tender amounts to over £3250.

## Correspondence.

### PLANNING OF SMALL HOUSES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be much obliged if you or Mr. Lanchester would kindly state approximately the price of the houses, plans of which appear in the articles on the "Planning of Small Houses." I am an unprofessional reader, and do not understand the statement "cube at 1d., £90." I make this enquiry with special reference to the cost of one house built on plan No. 7.—I am, dear Sir, yours very sincerely,

W. W.

(Unprofessional Reader.)

22, Sutton Place, Hackney, N.E.  
April 30th, 1897.

[As stated in the first article on "Planning of Small Houses," the actual cost would vary from four and a half to eight times that put on the plans as "cube at 1d." It is quite impossible to estimate with any degree of accuracy without knowing local conditions, style of finishing, &c. The design No. 7, for instance, would very probably be erected by a speculative builder for less than £400, while it could not be built by contract under something between £500 or £600.—EDITOR.]

### DIMENSIONS OF A CHIMNEY SHAFT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if you would kindly inform me as to the number of yards of 9in. brickwork there would be in an octagonal chimney shaft, the dimensions of which are given on enclosed diagram, and also give me the correct method of calculating same, and oblige,

Yours faithfully,

April 29th, 1897.

E. W.

[In reply to your enquiry re octagonal chimney shaft, it contains 65½ yd. (sup.) of 9in.

brickwork. There are two ways of arriving at this; the one generally adopted by Measuring Surveyors is to draw out plans and elevation to a large scale, say 1½ in. to 1 ft., and measure it from the drawings, taking the outside measure of four sides, and the inside of the other four sides, and, as the chimney tapers, add the sizes of the tops and bottoms of each

section together, and divide them by 2 to get at the mean; multiply what you obtain by the height: the mean girth at the bottom is 11ft. 7in., and at the top of the bottom section 10ft. 4½ in.; add these together and divide by 2, and multiply by the height, viz., 12ft. = 131ft. 9in. of 18in. brickwork. The mean size of the bottom of the upper section is 11ft. 3in., and of the top 9ft. 4in.; added together and divided by 2, and multiplied by the height, 21ft. = 216ft. 1½ in. of 14in. brickwork.

The other way is not given by any authority that we can find, for we have looked up the most eminent, but we are desirous of giving our correspondent the best information to be obtained anywhere, and have therefore worked out at great length some very intricate problems in algebra and trigonometry, with the following result: the girth of an octagon is 3.312 times its diameter; the base of the chimney you give is 5ft. outside, and 2ft. inside the mean = 3.5, as it is 33ft. high and diminishes ½ ft. in every foot of its height, and the bottom section is 12ft. high, deduct ½ ft., and you get the top of this section = 3.136ft.; add these means together, divide by 2, and you get the mean = 3.318.

3.5 bottom.

3.136 top.

2)6.636 multiply this by 3.312

3.318

3.312 and you get the

10.989 mean girth of the lower section.

12 multiply by the height, 12ft.

131.868 ft. of 18in. work.

The upper section in

the same way = 3.428 bottom.

2.791 top.

2)6.219

3.109 mean.

3.312

10.296

10.296 mean girth of upper section.  
21 ft. high.

216.216 ft. of 14in. brickwork.

2 bricks or 18in. thick. 1½ bricks or 14in. thick.

131.8

216.2

4 half bricks.

3 half bricks.

527.2 = ½ brick thick.

648.6 = ½ brick thick.

648.6

2)1175.8

9)587.9

65½ yds. sup. of 9in. brickwork (or one brick thick).—EDITOR.]

### R.I.B.A. ELECTIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Since the publication of my previous letter I have ascertained, from an Institute paper, that from May 5th, 1896, to May 3rd, 1897, there were twenty-eight meetings of the Council, and that no less than sixteen of the members each only attended two and three-sixteenth times!

All but one or two of these members are re-nominated for another year, but five of them never put in even one appearance, four only went to one meeting each, and two were only seen twice out of a possible twenty-eight times!

Some explanation is due to the members of the Institute for these extraordinary re-nominations of members who undertake duties which they are unable to carry properly into effect.

I am, Sir,

A METROPOLITAN FELLOW.

London, May 8th, 1897.

THE Prince of Wales will reopen the restored chapter-house at Canterbury, and unveil a stained-glass window in that building on May 29.

## SOCIETY MEETINGS.

**Liverpool Architectural Society.**—Mr. G. Bradbury presided at the annual meeting of the Liverpool Architectural Society held on the 3rd inst. The annual report, presented by Professor Simpson (honorary secretary), stated that the number of members on the roll was 121, as against 187 last year, and included 52 fellows, 22 associates, 29 students, and 18 honorary members. The council regretted that Mr. H. L. Beckwith had retired from the position of honorary secretary, which he had held for a period of seven years. It was hoped that the council would be able to establish a travelling studentship to be awarded at the end of each session, and also during the next session, to suitably celebrate the jubilee of the Society.—The statement of accounts presented by Mr. James Dod showed cash in hand £26 3s. 3d. on the general account, and £36 19s. 5d. on the library account. The following officers were elected for the fiftieth session:—Mr. Councillor W. E. Willink (president), Messrs. E. A. Ould and J. Woolfall (vice-presidents), Professor F. M. Simpson (honorary secretary), Mr. A. Thornely (assistant honorary secretary), Mr. James Dod (honorary treasurer), Mr. J. W. Blakely (honorary librarian), and the following as members of the council:—Messrs. H. L. Beckwith, G. Bradbury, T. E. Eccles, H. Hartley, H. A. Matear, E. A. Ould, and J. Woolfall (fellows), and J. W. Blakely and F. E. P. Edwards (associates).—Mr. George Bradbury, in a short address, remarked that as a mark of the jubilee of their Society, which was the oldest of the kind in the kingdom, a special effort should be made during the next year to increase their membership, and thereby increase the importance of their Society; whilst endeavours should also be made to increase the usefulness of the Society.

**Glasgow Architectural Association.**—At a meeting of this Association held in the rooms, 187, Pitt Street, Mr. Geo. S. Hill, vice-president, in the chair, Mr. Wm. Jas. Anderson read a paper on "The Acropolis of Athens in the Light of Recent Researches." The essayist in the first place showed the kinship of the primitive acropolis of Troy, Tiryns, Mycene, and Athens, and the indications at Athens of the pre-Homeric era, to be superseded by that of Hellenic Greece. The buildings of this period were severally considered in their purpose, the ancient temple of Athene Polias, the Parthenon of Pericles, the entrance gates of Propylaea, and the megaron of Erechtheus, and his museum or heroon. The present aspect of the buildings, their architectural details, and their former magnificence, were shown by a long number of lantern views.

**Building Societies' Association.**—The annual meeting of this Association, which was established on its present basis in 1869 for the purpose of protecting the interests and privileges of building societies, to collect for the use of subscribers all legal decisions affecting these institutions, and to watch the proceedings in Parliament in reference to them, was held on Wednesday last at the Westminster Palace Hotel. In the absence of Sir John Lubbock, M.P., the chair was taken by Mr. C. Binyon, chairman of the executive committee. In moving the adoption of the report, the chairman said the most important of the measures affecting the interests represented by the Association now before Parliament was the Land Transfer Bill. Whilst recognising that the Bill was an improvement in several respects upon any previous Government Bill dealing with the question, the committee felt strongly that any alteration of the existing law which did not insure promptitude and cheapness in land transfer would be not only of no value, but absolutely prejudicial to the interests of building societies. Legislation had had a great deal to do with the recent decrease in the business of building societies, and he was afraid that the result of the legislation in connection with building societies would be very similar to that affecting trustees' savings banks, some of the best of which throughout the kingdom had had to be closed.

**Sanitary Inspectors' Association.**—At a meeting of the Sanitary Inspectors' Association recently held at Carpenters' Hall, London Wall, a paper was read by Mr. W. H. Grigg (vice-chairman), on "The Proposed Drainage Bye-laws for the Metropolis." Mr. W. W. West (chairman of the council) occupied the chair. Mr. Grigg, in the course of his paper, which was largely of a technical character, said that the necessity for a complete code of drainage bye-laws for the metropolis was obvious to everyone, and it was difficult to understand why it had not long ago forced itself on the authorities as a matter of extreme urgency, particularly when London's central authority had had the power to make bye-laws since 1855, and had now prepared them under that Act. In commenting on the bye-laws, he pointed out several respects in which he considered they required to be amended. There was no provision made for the submission of plans, sections, and elevations of the proposed works to the local authority to be approved before commencing the works; the fall of drains was not specified; drains were not required to be true in invert and clear in bore; construction of piers for iron drains was not specified; inspection chambers were not made compulsory; there was no pen-

alty for covering up work before it was approved by officers of the local authority; the supplying of water and filling of drains by the builder was not provided for; and the construction and maintenance of urinals was left out entirely. When sanitary inspectors served notices requiring certain specified works to be performed, unsympathetic owners frequently retorted, "Well, if I do all this work now, what guarantee have I that in a year's time you will not come again and condemn it all owing to some new fad, and require something else?" And when it was borne in mind that it was only on June 28th, 1893, that the bye-laws under the Public Health (London) Act, 1891, were issued, which differed materially from those now proposed by the London County Council, it was not surprising that such complaints should be made. Continuity in methods and requirements was a most desirable thing in this matter, and unless there was some absolute proof that the existing requirements were inadequate, it was earnestly to be hoped that the change would not be insisted on. There was nothing to show whether these bye-laws were to supersede those under the Public Health (London) Act, 1891, or if they were both to exist side by side. Many necessary things were provided for in the latter which were omitted from the

new ones, and if they were to remain in force, in matters dealt with by both, they must be made to agree. That the new bye-laws had in them the elements of a great change there could be no doubt, but if they were not made to apply to repairs, &c., in old houses, a great work yet remained to be done.—A discussion followed.

**The Institution of Civil Engineers.**—The result of the ballot for the election of the council has now been declared as follows: President, Mr. J. Wolfe Barry; vice-presidents, Mr. W. H. Preece, Sir Douglas Fox, Mr. James Mansergh, and Sir William Anderson; other members of council, Mr. Horace Bell, Mr. Alex. R. Binnie, Mr. T. Forster Brown (Cardiff), Mr. Henry Deane (Sydney), Mr. W. R. Galbraith, Mr. George Graham (Glasgow), Mr. J. C. Hawkshaw, Mr. Charles Hawksley, Mr.

Recommended & Specified by Architects & Sanitary Engineers.

Perfect Sanitation, Healthy Houses

OBTAINED BY ADOPTING THE

"TWYCLIFFE" Patent Pedestal Syphon W.C. Basin.

A new Departure, embodying the latest developments in Sanitary Science, as applied to W.C. Basins.

Advantages claimed for the "TWYCLIFFE" Syphon:

Perfect safeguard against sewer gas and the evils arising therefrom.

Practically noiseless in action.

Simple in construction, reliable in action.

No complicated mechanism to get out of order.

Easily fixed as an ordinary Basin.

High-Class Article of Superior Material, Workmanship and Construction.

Inglis, Dr. Kennedy, Mr. John Kennedy (Montreal), Mr. George Fosbery Lyster (Liverpool), Mr. William Matthews, Sir Guilford Molesworth, Sir Andrew Noble (Newcastle), Dr. B. B. Stoney (Dublin), Mr. F. W. Webb (Crewe), Sir William White, and Sir E. Leader Williams (Manchester).

It has been arranged to hold a conference of the members of the Institution in London this year under conditions which, it is hoped, will be convenient to many who are precluded from attending the weekly meetings during the session, and may be serviceable to all by the discussion of a wider range of subjects than can be dealt with on ordinary occasions. It is intended that the business of the conference should differ from the ordinary proceedings of the Institution, papers descriptive of works executed giving place to brief statements concerning important debateable matters in engineering science and practice, introduced with a view to eliciting discussion on the questions raised. The conference is fixed for May, 25, 26, and 27, the morning of each day (from 10.30 to 1.30) being devoted to the consideration of the statements referred to, and visits of inspection to engineering works being made in the afternoon. The work of the conference will be carried out under the direction of the council, with the assistance of seven sectional committees, consisting of members of the institution representative of various localities in the United Kingdom, and identified with the several branches of engineering. The sections are:—Railways, with Sir Benjamin Baker as chairman; harbours, docks, and canals, Mr. Harrison Hayter, chairman; machinery and transmission of power, Sir Frederick Bramwell, chairman; mining and metallurgy, Mr.

T. Forster Brown, chairman; shipbuilding, Sir William H. White, chairman; waterworks, sewerage, and gasworks, Mr. Mensergh, chairman; and applications of electricity, Mr. W. H. Preece, C.B., chairman.

**Society of Engineers.**—At a recent meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, London, Mr. G. Maxwell Lawford, President, in the chair, a paper was read by Mr. Henry O'Connor (Vice-president), entitled "Automatic Gas Station Governors." The author first explained the need for the station governor in a gasworks, and pointed out that the pattern now in use and being manufactured by many firms was practically the same as that made 50 years ago. He then described the working and the method of finding the weights necessary for throwing certain pressures, and proceeded to explain the necessity of the parabolic form of cone. He then described the most notable of the suggestions made from time to time to improve the working of the governors, such as the double-cone governor, the equilibrium single-cone governor, the governor with a separate loading-bell worked at a distance from the cone bell, water-loaded governors, the double-bell and cone equilibrium governor, the throttle-valve governor, and governors with parallel side valves. The use of clockwork for the purpose of regulating the time of the loading and unloading of the bell was noticed, and also the loss due to uneven pressures. A new method of automatically loading governors according to the absolute requirements of the district was described, with details of several ways in which that might be carried out. The advantages of this system were pointed out, and a method of approximately registering the output of gas by the variations in pressure was suggested.

[Engineer's estimate, £89 9s. 10d.]  
[To be made up by Council's own staff.]

**TUNBRIDGE WELLS.**—For the erection of swimming and slipper baths, for the Corporation. Mr. T. E. W. Mellor, C.E., Town Hall, Tunbridge Wells. Quantities by Mr. C. Norton, Tunbridge Wells. £8,442  
Davis and Leaney 8,083  
Longley & Co., Craw-Award. ley\* 27,985  
\*Accepted.

**WAKEFIELD.**—For the erection of dwelling-house, Stanley-road, for Mr. David Stephenson, jun. Mr. W. Wrigley, Architect, 10, Wood-street, Wakefield. Quantities by Architect.  
Brickwork and Stonework—B. Lockwood, Westgate Common, Wakefield 17 6 0  
Slating—J. Illingworth, Bank-street 17 17 6  
Plastering—T. C. Tattersall, Trinity Church Gates 23 14 8  
Joinery—J. Lazenby, Eastmoor, Wakefield 72 17 0  
Plumbing and Gasfitting—F. E. Mosley, Northgate 47 0 0  
Painting—S. Rayner and Son, Southgate 5 0 0  
£342 9 2

**WITHAM (Essex).**—For the erection of an infirmary at South Metropolitan District School, for the managers. Mr. F. Whitmore, Architect, Chelmsford. Quantities by Mr. J. L. Parmenter, Ipswich. £3,975  
Everett and Son 3,957  
Geo. Grimwood and Sons 3,857  
Silas Parmenter 3,842  
Robt. Girding 3,789  
J. B. Smith and Sons. ford\* 3,700  
\*Accepted.

**SANITARY INSPECTORS' EXAMINATIONS.**—An Associate of the Sanitary Institute thoroughly prepares Candidates for the above EXAMINATIONS by Correspondence. No books are required. For particulars and testimonials apply "Certified Coach," 31, Herbert-road, Plumstead, S.E.

Price 3s. 6d.  
**GLOSSARY OF TECHNICAL TERMS** used in Architecture and the Building Trades. By GAVIN JAMES BURNS, B.Sc., F.S.I. Contains explanations of over 2000 terms.  
London: E. and F. N. SPON, 125, Strand.

**CIVIL SERVICE TECHNICAL EXAMS.**—Preparation personally or by correspondence. Residence can be arranged if desired. Full particulars on application to Mr. A. H. HENTY, Perchard House, 70, Gower-street, W.C.

**WOOD BLOCK FLOORING.**  
**MASTIC** for laying above supplied in any quantity.  
W. BRIGGS, Chemical Works, DUNDEE,  
SOLE MAKER OF  
"Tenax" Building Rock Compositior.  
For Wall Cavities.

**PILKINGTON'S**  
WORKS: **TILES.**  
CLIFTON JUNCTION, NEAR MANCHESTER.  
MANUFACTURERS OF HIGH CLASS TILES.  
For Floors, Halls, Hearths, Grates and Furnitv-e.  
EVERY VARIETY OF TILE WORK FOR  
CHURCHES, PUBLIC BUILDINGS AND  
PRIVATE RESIDENCES.  
London Show Rooms: Lyric Chambers, 45, Whitcomb Street W.C.  
Manchester Show Rooms 37, Cross Street

A few copies of Vol. IV. may still be had on application to the Manager, price 5s. each.

**R. I. B. A. EXAMS. PREPARATION** personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library, Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**THE LONDON (TELEPHONE {Holborn, No. 1011.})  
DRAWING & TRACING OFFICE,**  
98, Gray's Inn Road, Holborn, W.C.  
(Adjoining Holborn Town Hall.)  
MANAGER, JOHN B. THORP, ARCHITECT & SURVEYOR.  
Cheques crossed. The City Bank, Ltd.  
Office hours—Nine to Six. Saturdays One.  
Established 1883.

For the PROMPT and EFFICIENT execution of all work usually required by the PROFESSION, such as  
**WORKING DRAWINGS, TRACINGS,  
PERSPECTIVES, SURVEYS,  
COMPETITION DRAWINGS,  
Black Line PHOTO-COPIES and Blueprints.  
Quantities, Specifications LITHOGRAPHED.  
MODELS, DIAGRAMS, &c.**  
Estimates by return of post on receipt of full particulars to the MANAGER.

**COUNTY BOROUGH of BARROW-IN-FURNESS.**  
CHIEF ASSISTANT.  
The Health Committee are desirous of receiving APPLICATIONS from persons qualified to carry out the duties of CHIEF ASSISTANT in the office of the Borough Engineer and Surveyor.  
Salary £150 per annum.  
Further particulars may be obtained on application to the undersigned.  
Candidates' ages must not be less than 24, nor more than 32.  
Canvassing any Member of the Corporation will disqualify a candidate.  
Candidates must have had previous experience in municipal work, and preference will be given to those who have obtained either the Certificate of Competency granted by the Incorporated Association of Municipal and County Engineers, or who have passed the professional examination of the Institute of Surveyors.  
Applications must be sent to this office not later than the 17th inst., in the candidate's own handwriting, accompanied by copies of not more than three testimonials of recent date, addressed to the undersigned, and endorsed "Chief Assistant."  
W. H. FOX,  
Assoc. M. Inst. C.E.,  
Borough Engineer and Surveyor,  
Town Hall, Barrow-in-Furness,  
May 5th, 1897.

**ASSISTANT WANTED.** Competent to prepare drawings from sketches, construction and details. Some knowledge specifications and quantities desirable.—Apply, with salary and full particulars, GEO. ELKINGTON and SON, Architects, 95, Cannon-street, E.C.

**BOROUGH of ILKESTON.**  
WORKING FOREMAN WANTED.  
The General Works Committee are prepared to receive APPLICATIONS from men under 40 years of age, qualified to undertake the duties of WORKING FOREMAN.  
Wages 30s. per week.  
Applications in the handwriting of the candidate, giving full particulars as to previous experience, with three testimonials of recent date, to be delivered to the undersigned before FIVE o'clock in the afternoon of THURSDAY, the 13th inst.  
HENRY JAS. KILFORD,  
Town Hall, Ilkeston,  
Borough Surveyor.  
May 3rd, 1897.

**APPOINTMENTS WANTED.**  
The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.,**  
DESIRES TO ASSIST others in the PREPARATION OF DRAWINGS at his own office.  
G. SCORER, 28, Newman-street, W.

**SURVEYOR (24) desires ENGAGEMENT** in Engineer's office. Experience in surveys (land and town), levels, and sewerage works. References and testimonials.—B. A. J., care of Mr. Walker, Poulton-le-Fylde, Lancs.

**GODWIN'S TILES**  
For PAVEMENTS  
WALLS HEARTHES &c  
AS USED BY THE  
Leading Architects & Builders  
13 Cathedrals, Thousands of Churches, Public Buildings, and Private Residences Paved with these Tiles. Best Quality Only.

# Surveying and Sanitary SUPPLEMENT.

MAY 12TH, 1897.

## WORKHOUSE PLANNING.

(Continued from page xxvi.)

By GEORGE H. BIBBY, F.R.I.B.A.

### No. IV.—MAIN BUILDINGS.

SOME of the requirements of the Local Government Board, with regard to the points to be attended to in the construction of workhouse buildings, have very recently been revised, but only to a slight extent as regards the main buildings. The suggestions of the Board remain as they have stood for some

health, whether able-bodied or aged, and residential accommodation for the master and matron; also the main dining hall, general stores, kitchen sculleries, bakery, and other administrative portions. A detached building for the master and matron is not approved, as it has usually been considered important that their apartments should form a central portion of the administrative buildings.

It is requisite where there are large numbers of inmates that there should be arrangements made for the sub-division into classes, with special regard to the antecedents, character, and habits of the paupers. This is important in large workhouses, especially for the pur-

"When any two persons, being husband and wife, shall be admitted into any workhouse, and either of them shall be infirm, sick, or disabled by any injury, or above the age of sixty years, it shall be lawful for the guardians of the union or parish to which such workhouse shall belong, to permit, in their discretion, such husband and wife to live together, and every such case shall be reported forthwith to the Local Government Board." In compliance with these Acts it is therefore necessary that the workhouse Architect should provide upon his plans for a few apartments having each a superficial area of not less than 100ft, preferably with a fireplace, and with

~ Fig. 5. ~

years, except that the following paragraph is now omitted: "In large workhouses where there are considerable numbers of inmates in health, the wards for that class may be made 36ft. wide and the beds be arranged in four rows, a dwarf partition, about 4ft. high and about 8in. off the floor, being fixed between the two rows of beds in the middle of the ward." I mention this alteration purposely at this juncture to illustrate the necessity for obtaining the most recent information existing of any variations in the regulations of the Local Government Board, without which knowledge much delay and loss might arise by reason of disapproved plans.

The main building must contain the necessary accommodation for the adult inmates in

poses of discipline and good management; and it is obviously fair that unfortunate persons of good character should not be compelled to associate more than is absolutely necessary with the vicious and offensive.

The Act 10 and 11 Vict., cap. 109, sec. 23, provides that "when any two persons, being husband and wife, both of whom shall be above the age of sixty years, shall be received into any workhouse, in pursuance of the provisions of Act 4 and 5 Will. IV., c. 76, or other Act, or of any rule, order, or regulation of the Commissions appointed by the authority of this Act, such two persons shall not be compelled to live separate and apart from each other in such workhouse." Further than this, the 39 and 40 Vict. cap 61, sec. 10, provides,

good ventilation and lighting. The position of these on the general plan of the workhouse may be central between the buildings for males and females, and, where there are many married couples so housed, some separate day-room accommodation might be added, otherwise the husbands and wives would, during the evenings and when not working, occupy the day-rooms appropriated to males or females respectively—a large dormitory separated into cubicals by screens not reaching to the ceilings is undesirable for married couples in workhouses.

I have before shown that certain alterations have been made recently with regard to the regulations as to widths of wards for inmates in health; as matters stand at present the

minimum requisite amount of space per bed for adult inmates in health is:

	Wall Space, irrespective of that occupied by doors and fireplaces.	Floor Space.	Cubic Space.
	Feet.	Feet.	Feet.
In dormitories.....	4	36	360
In dormitories for women with infants.	5	50	500
In dormitories occu- pied by infirm in- mates day and night.	5	50	500

In Fig. 5 is given an illustration of a simple arrangement for two dormitories, each for eighteen inmates, from which can be seen at a glance the relative areas required; in Fig. 5, at A, is a ward dormitory for eighteen able-bodied adults, each having a wall-space of 4ft. only, a floor-space of 36ft., and (as the apartment would be 10ft. in height) a cubic-space of 360ft., the width of this dormitory would be 18ft.; C is an apartment for an official, which, however, could be used as a ward-kitchen, should it be necessary, temporarily or otherwise, to convert this dormitory to hospital uses (in which case, of course, many beds would have to be removed to allow sufficient cubic space for sick inmates); in the present form, however, it is intended for able-bodied adults in health, and it cannot be said that the minimum areas and cubic contents shown, although, in accordance with official regulations, are quite so liberal as might be desired.

A bath-room is provided at B, and water-closets and lavatories in an annexe at L and W, from this annexe, at P, would be a circular iron panic or fire-escape staircase, which would be approached only by a door arranged to sound an alarm when used; the main staircase would be of fire-resisting materials in short flights of steps, and with ventilating windows at F to prevent foul air from rising to the upper floors from those below.

An area equal to the space of two beds is lost in this dormitory, in order to allow wall spaces for the two fireplaces.

The ward at D on Fig. 5 would, as regards area and cubic contents, be sufficient as dormitory accommodation for women with infants, or as dormitories occupied by aged or infirm inmates day and night; in this ward 5ft. of wall space is allowed to each bed, 50ft. of floor space and 500ft. cubical space, exclusive of the spaces opposite the two fireplaces, each of which is equal to that given to one bed, with a wall space of 5ft.—the width of ward D is 20ft.; in other respects the arrangements would be similar to those shown for ward A. In the case of old workhouses, where alterations or extensions may be made, and where the existing means of ventilation are difficult to arrange, such dimensions and areas as are above given would not be sufficient.

The cubic space allowed for such rooms in the metropolis has been more liberal. So far back as 29th September, 1870, the Poor Law Board required that infirm persons, occupying the same room day and night, should each be allowed 700 cubic feet of space in their dormitories; infirm persons, able to leave their dormitories during the day, 500 cubic feet; and healthy persons, 300 cubic feet. For the last two classes day-room accommodation was also demanded.

The day-rooms for the inmates in health must be arranged at the rate of 15ft. of floor space for every inmate in their dormitories; work-room accommodation should not count as day-room space; the windows of day-rooms and dormitories should face each other, so as to obtain cross-ventilation.

When practicable it is frequently advisable to provide accommodation for the aged upon the ground floor, where verandahs, bay windows, and easy access to the airing courts would add to their comfort and that of the officials.

In large workhouses a greater variety of

occupations for the paupers are practicable, and more rooms are necessary for the purpose of separating the workers; the work done is oakum-picking, stone-breaking, wood-chopping and sawing, tailoring, shoemaking, painting and carpentry for the males; and laundry-work, sewing, cleaning, &c. for the females. The workrooms should, if possible, have a southerly aspect, and be well ventilated, warmed, and lighted.

The washhouse and laundry for a large workhouse forms a very important item; it should be a detached one-story building, with an open roof and Louvre ventilators therein: proper means for keeping the floor dry, and for the protection of the feet of the women while standing at the wash-tubs, should be provided; also suitable drying closets; as a rule, it will be found advisable to provide for both hand and machine-washing, as there are usually a number of able-bodied women for whom such occupation is a convenient employment, while on the other hand machine washing is desirable in many instances and for foul washing. In planning workhouse laundries it will be observed that the alternatives of hand-washing and machine-washing may influence Architects considerably in deciding upon the areas of the laundry buildings; further, some machines are much less economical than others as regards the space they would occupy. Machines are made which almost form washhouses in themselves, and there can be no doubt that laundry machinery would be made much more use of in workhouses were it not desirable to find employment at the wash-troughs for the female paupers.

In connection with large workhouses, where isolated hospitals for fever and smallpox patients exist, a special laundry of small extent should be provided in proximity therewith. This may consist of three or four apartments, including a disinfecting chamber, a reception room, washhouse, laundry, and drying closets, &c.

There should, in the general laundry, be provided about five 10ft. drying-horses to every 100 patients. These usually occupy a considerable area, as there must be ample space, not only for drawing out the horses, but also for depositing baskets, trucks, &c.

In the construction of a laundry for a workhouse, the superficial space to be allowed for each inmate should not be less than 5ft.; therefore, for a workhouse for 1000 inmates, there would be required an area of 5000ft., which would include a portion, probably of about 250ft. area, for the foul washhouse, but be exclusive of the laundry for the fever hospital; in large institutions a separate laundry might be added for the officials.

The walls of a workhouse laundry should, to a height of 5ft. or thereabouts, be lined with white glazed bricks or tiles; the apartments should be light and well ventilated. Some laundries are only lighted from the roof, but it would appear to be much more desirable that there should, in addition, be a fair supply of windows in the side and end walls, the washhouse especially should be constructed so as to allow the washing-troughs to face the windows, not only for purposes of light, but also to secure for the female paupers employed therein as much cheerfulness as may be.

In the foul and fever washhouses, washing machines would be used rather than hand labour, and steam power would frequently be advantageous, the belting, &c., being driven from below the floor level rather than from shafting overhead, although circumstances may render the latter arrangement more convenient sometimes.

The boilers might be used for all purposes connected with the engines, hot water and steam supply, electric lighting, &c., as well as for laundry purposes, and it may be desirable also to make such arrangements as would utilise the exhaust steam from the engines, especially for heating purposes.

There should for all laundries always be an ample supply of absolutely pure soft water. In some districts the water, though soft, may be strongly impregnated with organic matters, or it may be hard by reason of its having come in contact with, or passed through, mineral strata. By filtering either of the

above described waters, these objectionable qualities can be taken from them, leaving the liquid apparently perfectly clear. Should it still remain hard, caustic soda is sometimes added in the proportion of 2oz. to each 100 gallons of water. The cisterns in which these mixtures are made should have an outlet at the bottom for the escape of the mud, &c., when necessary, and the pipe for drawing off the water should be at the height of 3in. or 4in. from the bottom, so that the opening may not be obstructed by the sediment. The question as to whether or not these cisterns would be required, and their size, is one that may influence the planning of the laundries, and should be considered at the outset by the Architect.

It is my intention to give a detailed statement upon the whole subject of laundries. It is too extensive to be dealt with in this series of papers. The Local Government Board have recently withdrawn a certain section of the points requiring attention in workhouse construction, which stated that a *training wash-house and laundry* should be provided for the girls. The institutions for boys and girls are best kept apart from workhouse surroundings, together with the schools laundry.

The general dining-hall, which is often used as a chapel, should be on the ground floor, and be well lighted, warmed, and ventilated, and convenient of access for all classes of inmates. The ventilation should provide for the complete and rapid removal of vitiated air, and the Local Government require that a minimum floor space of 6ft. should be allowed in it for each person. There should be a washing-up scullery adjoining the dining-hall, and, if convenient, a serving or cutting-up room. Both the kitchen and scullery should be conveniently near to the dining-hall, and must be one-story buildings with means of ventilation in the roof space. The apparatus for cooking in workhouses may be worked either by gas, steam, or ordinary fires, or by these in combination, and all boilers and other parts requiring periodical attention should be in duplicate, and if baking-ovens for bread be used these also should be at least two in number.

The airing courts for the aged must be enclosed with dwarf walls and palisades where classification renders this advisable. They should be paved with a material such as asphalt or tar-paving, but not with a sharp, cutting substance that would cut the inmates' shoes. A few seats with arm divisions are requisite. The walls for the airing courts for the able-bodied may be about 7ft. in height (not more), so as to avoid interference with light and air.

In a moderately sized workhouse, one ward on each side of the institution would be sufficient for the accommodation of refractory patients. These wards are required to be not less than about 10ft. by 6ft., or with 60ft. or more of area. They must have boarded floors, and be sufficiently lighted and ventilated, and be isolated from the inmates of other portions of the workhouse. They must be furnished with suitable seats and sanitary accommodation, and be provided with means of inspection from without, and be within a reasonable distance of an official's apartment or office.

The general position of the various main buildings of a workhouse will be shown in a complete plan of all portions to be given later.

(To be continued.)

At a meeting of the Cardiff Waterworks Committee, Mr. J. A. B. Williams, the Engineer for the new works, reported upon the progress which was being made with reservoir No. 1 in the Taff Vawr Valley. He hoped to get the work completed by September to catch the winter rains. The chief work to be done was the pitching of the embankment, which was being carried on as quickly as possible. There was, however, plenty of work for more men, and he suggested the advisability of securing the services of some of the Penrhyn quarrymen. — The committee instructed Mr. Williams to proceed with the work as expeditiously as possible, and the question of engaging more men was left to his discretion.

# Surveying and Sanitary Notes.

THE Wath Council has appointed Mr. H. C. Poole, assistant to the Rotherham Rural Council, surveyor, at a salary of £120 a year.

At the Town Hall, Bootle, a Local Government Board inquiry has been held by Mr. Rienzi G. Watton concerning the application of the Bootle Town Council for sanction to borrow £2834, required for carrying out works of street improvement. The proposal of the Council is to lay granite sets with a concrete foundation in Carolina Street and Bedford Place, and place Haslingden sets instead of boulders on the north side of Merton Road, these improvements having been rendered necessary by the large amount of heavy traffic at present passing over the roads. The application was not opposed.

MR. JOSEPH CORBETT, Borough Engineer of Salford, in reading a paper before the Liverpool Engineering Society on "Sewage Sludge Removal and Shipment," said they had in Salford, as in most old towns, a great number of ancient, badly-constructed sewers, with deficient falls, where silt accumulated continually under ordinary conditions, and where the scouring effects of storm water were insufficient to clear away the aggregations of silt. The sumps they had in use must be condemned on sanitary grounds as being a kind of cesspool, where foul gases were evolved; but at any rate they were not so bad as sewers choked with silt, and if frequently emptied were not seriously objectionable. So heap and effective was the shipment system as compared with any alternative available in their inland towns that he felt sure we should see within a few years many sludge steamers passing out from the various ports throughout the country; and probably also hopper steamers carrying excavated earth and other offensive refuse, for which it was now difficult in many places to find "tips." As this

system increased in extent it might be requisite to order the steamers to proceed to deeper water than at present, but that would not greatly enhance the cost. He therefore came to the conclusion that whatever future improvements might be made in the modes of removing sewer silt and tank sludge, we had now in all probability reached the best and most economical means for its final disposal by shipping it to the deep sea.

An acute stage has now been reached, says the Manchester Guardian, in connection with the long protracted dispute between Bo'ness Local Authority and the Local Government Board regarding Mr. William S. Burr, one of the sanitary inspectors of the burgh. The Local Authority, dissatisfied with the action of the Local Government Board in refusing to dismiss Mr. Burr from office, have now appealed to the Secretary for Scotland, and submitted to him the whole facts of the case since the dispute originated, more than three years ago. The Local Authority recently called upon Mr. Burr to cease interfering in any way in the sanitary affairs of the burgh, and that any infringement of this instruction would be reported to the Local Government Board. Bills have also been posted in the burgh asking the ratepayers to pay no heed to any instructions given by Mr. Burr. Notwithstanding, Mr. Burr continues to do sanitary work. As the Local Authority have a decree against Mr. Burr for £220 (being the amount of their legal expenses incurred in a recent action by Mr. Burr in the Court of Session, in which the Commissioners were successful), they pay him no salary. In a letter to the Local Authority, Mr. Malcolm McNeil, secretary to the Local Government Board, writes: "The Board have considered the position of the sanitary arrangements in Bo'ness with the fullest appreciation of the difficulties which confront the Local Authority. The following is their view of the situation: While it is not impossible that Mr. Burr may have been ill-advised in his dealings with the Local Authority; the Board are unable to recognise in his proceedings any indication of his inefficiency as an official, and they cannot therefore remove him from office."

THE report of the Medical Officer of Health to the Oldbury District Council for the year ended December 31st, 1896, states that the new scheme of sewage treatment at the sewage outfall works was now all but completed, and in a week or two it would be put into operation. It was constructed on a sufficiently large scale to enable the council to deal with the extra sewage that would be received from the Warley scheme. It was a large additional undertaking, and a difficult one to effect satisfactorily.

THE Worcestershire Council recently held an enquiry at Evesham respecting the proposal to restore the navigation works on the Upper Avon.—Mr. Holdberrow, an engineer who had surveyed the Upper Avon, gave particulars of his scheme, the cost of which for that part of the river he estimated at £8073.—For the opposition, Mr. Parfitt urged that the estimate of the cost of the scheme was absurdly low, that there was no possibility of the works paying, and that the scheme was merely brought forward for the sake of the pleasure-boat traffic of the people of Stratford and Evesham. Moreover, the occupiers of land on the riverside would suffer serious injury by the floods which the restoration of the works would involve.—Mr. Lionel B. Wells, engineer to the River Weaver Navigation, gave a detailed estimate of the cost of making the Upper Avon navigable for trading purposes. He considered that the cost of rebuilding the nine locks and weirs would not be less than £18,000. Dredging at the approaches of the locks only would cost from £500 to £1000. If, as was proposed, there was steam traffic, it would be necessary to protect the banks, and that would not cost less than £6000. To make proper hauling paths on each side would cost, he should think, £10,000, and then there was the question of making swing-bridges at Binton and Bidford, where the present bridges were very low.—Mr. Willis Bund, the chairman, said it seemed to him on various grounds the details of the scheme would have to be very seriously reconsidered before they would feel inclined, on behalf of the ratepayers of the county, to propose any guarantee on their behalf.

18	Buenos Ayres—New Central Railway Station		A. H. Mountain, Surveyor to the Council, Withington.
18	Dezives, Wilts.—Erection of Recreation-room, Asylum	Guardians	Roumanian Ministry of Agriculture, Bucharest.
18	Grays, Essex—Erection of Portion of School	Grays and Thurrock School Board	State Government, Buenos Ayres.
18	Halifax—Alterations, &c., to Shaw Lodge		County Offices, Trowbridge.
18	Holdsworth, Yorks.—Erection of Barn, &c.		C. M. Shiner, 2, Walbrook, E.C.
18	Huntly, Aberdeen—Erection of Hospital Wing	Holdsworth House Farm	W. Clement Williams, 29, Southgate, Halifax.
18	London, S.E.—Public Conveniences, Brockley		Medley Hall, 29, Northgate, Halifax.
18	Charlton—Erecting Club		Scott's Hospital, Huntly.
19	Middleton—Raising Roof of Retort House	London County Council	Architect's Department, Spring-gardens, S.W.
19	Brynmanan, Wales—New Congregational Chapel	Conservative Club	J. Rowland, 24, The Village, Old Charlton.
19	Highley, near Bridgnorth—Erection of School	Corporation	T. Duxbury, Gas Manager, Middleton.
19	London, E.C.—New Underground Conveniences	School Board	John Harris, Penylant House, Brynmanan (R.S.O.)
20	London, S.E.—Erecting Laundry, Repairing, &c.	Shoreditch Vestry	R. Scrivener and Sons, Howard-place, Hanley.
20	Essex, Yorks.—Additions and Alterations, &c., Police-station, &c.	Guardians of St. Olave's Union	J. Rash Dixon, Town Hall, Old-street, E.C.
		Standing Joint Committee of East Riding	Newman and Newman, 31, Tooley-street, S.E.
			County Surveyor, Beverley.

## COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—(Continued).</b>			
May 22	Corsham, Wilts.—Erection of Church	Exeter Church Extension Committee	H. Brakspear, Corsham, Wilts.
" 24	Beeston—Building Three Trough Houses	Lancashire and Yorkshire Railway	Carters, Punch Bowl Inn, Beeston, Leeds.
" 25	Blackburn—Extension of Goods Yard, &c.	Corporation	Engineer's Office, Hunt's Bank, Manchester.
" 25	Brighouse—Erection of Press-house, Chimney Shaft, &c.	Town Council	A. M. Fowler, 1, St. Peter's-square, Manchester.
" 25	West Ham—Erection of Boiler Houses, Electric Lighting Buildings, &c.	Commissioners of H.M. Works	L. Angell, Town Hall, Stratford, E.
" 26	Gateshead—Erection of Post-office	Guardians of Prestwich Union	The Secretary, 12, Whitehall-place, S.W.
" 27	Crumpsall, Manchester—Erection of Wards, Workhouse	Urban District Council	W. Telford, Gunson, and Son, 10, Marsden-st., Manchester.
" 31	Levenshulme—Erection of Council Offices, Stables, &c.	Church Institute	J. Jepson, Union-road, Stockport.
No date.	Burnley—Assembly Room, &c.	S. Rhodes	Thos. Bell, Architect, Burnley.
"	Hawsker, Whitby—House, Stables, &c.	Industrial Co-operative Society	J. J. Milligan, Architect, 77, Baxtersgate, Whitby.
"	Middleton, Lancs.—Store Building, Higher Wood-street	W. Wilson	F. W. Dixon, Architect, Trevelyan-buildings, Manchester.
"	Pelton Fell, Durham—Business Premises	Prestwich Conservative Club Building Co., Limited	F. Bowman, Architect, 52, Westgate-road, Newcastle.
"	Heaton Park, near Manchester—Club House		P. D. Lodge, Architect, 5, Cross-street, Manchester.
"	Sleetburn, Durham—Additions to Chapel		Plummer and Burrell, Architects, Market-place, Durham.
"	Manningham—Two Houses, &c., Lilycroft and West-field-roads		Fairbank and Wall, Architects, Craven Bank-chambers, Bradford.
<b>ENGINEERING—</b>			
May 14	Carlow, Ireland—Supplying and Fitting Range	District Lunatic Asylum	Clerk's Office, Carlow.
" 15	Clitheroe—Supply and Erection of two Purifiers	Gas Committee	R. Barrett, Manager, Gasworks, Clitheroe.
" 15	Dartmouth—Construction of two Flushing Tanks	Urban District Council	T. O. Veale, Surveyor, Dartmouth.
" 15	Sutton Harbour, Plymouth—Construction of Stone Quay, &c.	Sutton Harbour Improvement Company	H. Masterton, 1, Buckland-street, Plymouth.
" 15	Vienna—Supply of Machinery for three Water Stations	Urban District Council	Austrian State Railway Ministry, Vienna.
" 17	Hinckley—Gas Apparatus	Gas and Coke Company	Geo. Helps, Gasworks, Hinckley.
" 17	Cromer—Boiler House, &c.	Waterworks Company	P. Griffith, 55, Parliament-street, S.W.
" 17	Horsforth—Extension of Filters, &c.	Co-operative Society	H. A. Johnson, The Exchange, Bradford.
" 17	Banbury—Supply and Erection of Machinery for Dairy	Corporation	Architect's Department, 1, Balloon-street, Manchester.
" 18	Liverpool—Supply and Erection of two Furnace Cells	Swansea Harbour Trustees	City Engineer's Office, Municipal-buildings, Dale-street, Liverpool.
" 18	Swansea—Construction of Dock Entrance	Urban District Council	A. O. Schenk, Harbour Offices, Swansea.
" 19	Watford—(1) Extension of Engine-house, &c.; (2) Providing and Erecting Machinery	Sewage Committee	Council's Office, 14, High-street, Watford.
" 21	Bury, Lancs.—Supply and Erection of Eight-Cell Destructor, &c.	Sewage Committee	J. Cartwright, Borough Engineer, Bury.
" 21	Bury, Lancs.—Supply, Delivery, and Erection of Sludge Presses	Sewage Board	J. Cartwright, Borough Engineer, Bury.
" 22	Haslingden—Sludge-Pressing Machinery	Asylum Commissioners	H. Leonard Hinnell, 41, Corporation-street, Manchester.
" 21	Portrane, Co. Dublin—Heating, Ventilating, &c.	Urban District Council	G. C. Ashlin, 7, Dawson-street, Dublin.
" 26	Featherstone—Execution of Sewage Works	Guardians	G. and F. W. Hodson, Engineers, Loughborough.
" 28	Donegal—Construction of Reservoirs, &c.	Council	J. L. Devenisty-Meares, Town Hall, Newry.
" 29	Wakefield—Construction and Erection of Precipitating Tanks, &c.	Urban Council	R. Porter, Town Hall, Wakefield.
" 29	Wakefield—Supply and Erection of Pumping Engine, &c.	Urban Council	R. Porter, Town Hall, Wakefield.
" 36	Hebden Bridge—Construction of Two Cast-iron Culverts	Urban Council	John Newton and Son, 17, Cooper-street, Manchester.
June 1	Ashby-de-la-Zouch—Waterworks	Urban Council	G. and F. W. Hodson, Engineers, Loughborough.
<b>IRON AND STEEL—</b>			
May 15	Christiania—Supply of 1400 Cast-iron Pipes	Christiania Gasworks	Christiania Gasworks Office.
" 18	Heywood—Supply of 600 yards of Six Cast-iron Pipes	Gas Committee	W. Whatmough, Gas Manager, Heywood.
" 21	London, E.C.—Railings, &c.	Shoreditch Vestry	J. Rush Dixon, Town Hall, Old-street, E.C.
" 20	Manchester—Boundary Walls, Wrought-iron Railings, &c.	Parks Committee	City Surveyor, Town Hall, Manchester.
" 25	London, W.—Supply of about 280 tons of Steel Girders	Great Western Railway Company	Office of the Engineer at Paddington Station.
<b>PAINTING—</b>			
May 15	Hull—Painting	Guardians	R. G. Smith, 1, Cogan-chambers, Bowalley-lane, Hull.
" 17	Macclesfield—Painting, Parkside Asylum	Parks Committee	W. Lees, Parkside Asylum, Macclesfield.
" 17	Stockport—Painting of Iron Railings, &c.	Markets Committee	John Atkinson, St. Peter's-gate, Stockport.
" 18	Shrewsbury—Painting, General Market	Guardians	W. Chapple Eddowes Guildhall, Shrewsbury.
" 19	Manchester—Whitewashing	H.M. Office of Works	Poor Law Offices, New Bridge-street, Manchester.
No date.	Woolwich—Painting and Whitewashing		Royal Engineers' Office, Mill-lane, Woolwich.
<b>ROADS—</b>			
May 14	Stockport—Manual and Team Labour, and Materials, &c.	General Purposes Committee	John Atkinson, St. Peter's-gate, Stockport.
" 14	Preston—Paving, &c.	Corporation	Borough Engineer, Town Hall, Preston.
" 14	Buxton—Making-up of New Road	Corporation	W. H. Grieves, Town Surveyor, Buxton.
" 15	Penistone, Yorks.—Construction of Road, &c.	Green Land Society	H. J. Brettoner, Ward-street, Penistone.
" 15	Plymouth—Supply of Granite Setts, Channels, &c.	Harbour Commissioners	James Paton, Municipal Offices, Plymouth.
" 17	Belfast—Supply of about 2700 tons of Setts	Commissioners	G. F. L. Giles, Harbour Engineer, Belfast.
" 17	Kingstown, Ireland—Sewering, Laying Water and Gas Mains, &c.	Town Council	J. Donnelly, Town Hall, Kingstown.
" 17	Saffron Walden, Essex—Tar Paving, High-street	Urban District Council	G. W. Lacey, Borough Surveyor, Saffron Walden.
" 18	Spennymoor—Footpaths	Urban District Council	G. W. Rogers, Silver-street, Spennymoor.
" 18	Frimley—Supplying and Laying Kerbing	Union	W. J. Hodgson, Council Offices, Camberley.
" 19	West Ham—Granite Spalls	District Council	Offices, Union-road, Leytonstone, E.
" 19	Heaton Norris—Welsh Granite Paving Setts	Town Council	Council Offices, 79, Heaton Moor-road, Stockport.
" 22	Batley—Levelling, Paving, Flagging, &c.	Weaver Navigation Trustees	O. J. Kirby, Market-place, Batley.
" 24	Northwich—Construction of Roads	Corporation	Weaver Office, Northwich.
" 25	Dartmouth—Paving, Kerbing, &c.	Joint Committee of the L. and N.W. and G.W. Railway Companies.	T. O. Veale, Borough Surveyor, Dartmouth.
" 29	Bebington, Cheshire—Road Diversion	Urban District Council	Office of the Joint Engineer, Birkenhead.
June 1	Urmston—Paving, Flagging, and Draining Works		C. C. Hooley, Council Offices, Urmston.
<b>SANITARY—</b>			
May 14	Hurst, near Ashton-under-Lyne—Removal of Nightsoil	Urban District Council	Surveyor, Council Office, King-street, Hurst.
" 15	Barnard Castle—Sewers, &c.	Rural District Council	R. Robinson, 6, Dixon-terrace, Darlington.
" 15	London, W.—Wood Paving Blocks	St. Marylebone Vestry	Court House, Marylebone-lane, W.
" 17	Birmingham—Sewer, &c., King's Norton	Corporation	E. Pritchard, 37, Waterloo-street, Birmingham.
" 17	Swindon—Construction of 6in. Sewer (about 1100 yards)	Water Board	Engineer, Newport-street, Swindon.
" 17	Walsall—Scavenging, 1 year, Aldridge	Rural District Council	A. H. Lewis, 1, Leicester-street, Walsall.
" 18	Bromley, Kent—Drainage Works	Urban District Council	Surveyor, District Council Offices, Bromley.
" 18	Bromsgrove—House Connections	Rural District Council	W. Fiddian, Town Hall Offices, Stourbridge.
" 18	Aspull—Removal of Nightsoil, 1 Year	District Council	Chairman of the Council, White Hall, Aspull.
" 19	Abram—Iron Fire Sewers, &c.	Urban District Council	Heaton, Ralph, and Heaton, Engineers, Wigan.
" 19	Mitcham—Construction of Sewer	Rural District Council	Surveyor, Vestry Hall, Mitcham.
" 19	Rochester—Wood Paving (170 superficial yards)	Corporation	City Surveyor, Guildhall, Rochester.
" 21	Bury—Sewage Disposal Works	Corporation	J. Cartwright, Borough Engineer, Bury.
July 31	Oporto, Portugal—Sanitary Improvement Works	Corporation	Municipal Town Hall, Oporto.
May 15	Lancaster—Wood Blocks (1950 square yards)	Streets Committee	J. Cook, Town Hall, Lancaster.

# THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD WITH SURVEYING AND SANITARY SUPPLEMENTS

## A National Monument?

In the present (the Royal Academy Number) of The Architectural Review, by two different writers, there are the germs of a scheme which might well be developed into the most notable and enduring part of the forthcoming rejoicings in June. Mr. Beresford Pite, on page 308 of his admirable and masterly essay on "Design in Drawings" (which, by the way, is pregnant with words of wisdom, and contains rare and original thoughts on a most delightful subject, and is quite a pleasure to read as a literary effort, quite apart from its value otherwise), says "a sad significance attaches to the fact that this year, celebrating as we do an unexampled era of national peace and happiness, we find ourselves incapable of suggesting or promoting any monument or offering of gratitude to posterity as a glorious heritage from a glorious age." These words, we think, suggest an idea which might be taken up with the enthusiasm born of a love of country, and characteristic of a great and warm-hearted people, anxious to give expression to their gratitude for the blessings showered upon them throughout a wise and beneficent reign. That, at least, is the ideal view of it, it remains to be seen whether the love and enthusiasm will be equal to an occasion the like of which is rare in the history of the world. If it is to be done at all it should be done well, that goes without saying. The scheme, whatever it embraces, must be *Imperial*. No one but the greatest National Artists should be employed upon it. That we have such men, here in England to-day, who are capable, together, of producing such a work, a work worthy of the nation's pride and power, happily requires no proof. If the genius and power displayed in this year's Royal Academy Exhibition could be gathered together into one fine building, what a wealth of work we should have. The only thing in doubt, unhappily, is the question of our Statesmanship. Can those in power have their attention diverted for once in a long while from questions with which we are all familiar, and some of us very tired, to a consideration of the possibilities of such an idea which we are about to suggest? Can they not be persuaded that their great abilities might well be brought to bear on a subject really worthy of them, upon an occasion rare in the history of mankind, and towards the realisation of a scheme which ultimately might be comparable to the mighty works of the Middle Ages or to that of the Greeks of old? Such an end as this, the raising of an enduring monument to England's greatness, a symbol of her gratitude, of her whole-hearted recognition, of the privileges enjoyed during this sixty years reign of wisdom and strength; is not that an end worthy of the country's greatest effort in Art at the close of the nineteenth century? Mr. Beresford Pite has made the righteous complaint; Mr. Wilson, in his article in the same number of the Review, curiously enough makes exactly the right suggestion, which we in turn say would be fittingly dedicated to the purpose we have just described. We appeal to our readers to study that beautiful word picture on page 278, of an apparently impossible building which we believe might be made possible by the timely co-operation of our Artists and Statesmen. We hope some of the latter may be persuaded to read that

picture by Mr. Wilson aright and be the means of bringing it "within the range of practical politics." It is a better and nobler aim than many now engaging their attention, and one which would bring to them an abiding name in history as unselfish servants of their country and Queen.

## George Gilbert Scott the Younger.

ALMOST unheeded, wholly ignored, of course, by the daily Press—the latter is more concerned with the doings of trivial Members of Parliament—there passed away last week from our

Gilbert Scott must be great indeed, passing all others on earth. That and the whole-hearted admiration of his friends was his in full measure, and those who knew him best say he desired and worked for nothing more. No man in England this century has done finer work, and yet among the generality of Architects no man is less known, except as bearing the same name as his popular father. To most people it would come as a surprise to be told that George Gilbert Scott the younger, apart altogether from his merits as an Architect, was a literary genius of the highest order, who, in addition to a brilliant University career (being senior

ALL SAINTS CHURCH, WEST DULWICH. G. H. FELLOWES PRYNNE, ARCHITECT.

midst one of the greatest Architects, if not the greatest, of our day and generation. The loss of a great Artist, it is true, is sometimes recognised by the external appearance of a nation's grief, which reflects, doubtless, to some degree popular feeling. Evidence of this has not been wanting, but it is often due more to a sense of his position as a public man than to a true appreciation of his genius. The man who is an Artist first, before all things, must be content to live and die comparatively unknown, except to his brother Artists; his work must be to him his only reward. The pleasure of seeing a former vision wholly realised, his task well done, that reward to such a man as the late George

of his Tripos, and afterward elected Fellow of Jesus), has written one of the most masterly essays on "The History of English Church Architecture" ever penned in the English language. It is already, and deservedly so, a classic work on Art, but, unhappily for men, almost as unknown as his buildings. And yet these latter are fairly numerous and important—important, we mean, in another than an Artistic sense. The Church at Norwich, for example, which he designed and nearly finished for the Duke of Norfolk, attains almost to the rank of a Cathedral, whilst his great Church of St. Mark's at Melverton, near Leamington, is one of the largest parish Churches in the county. This latter is a

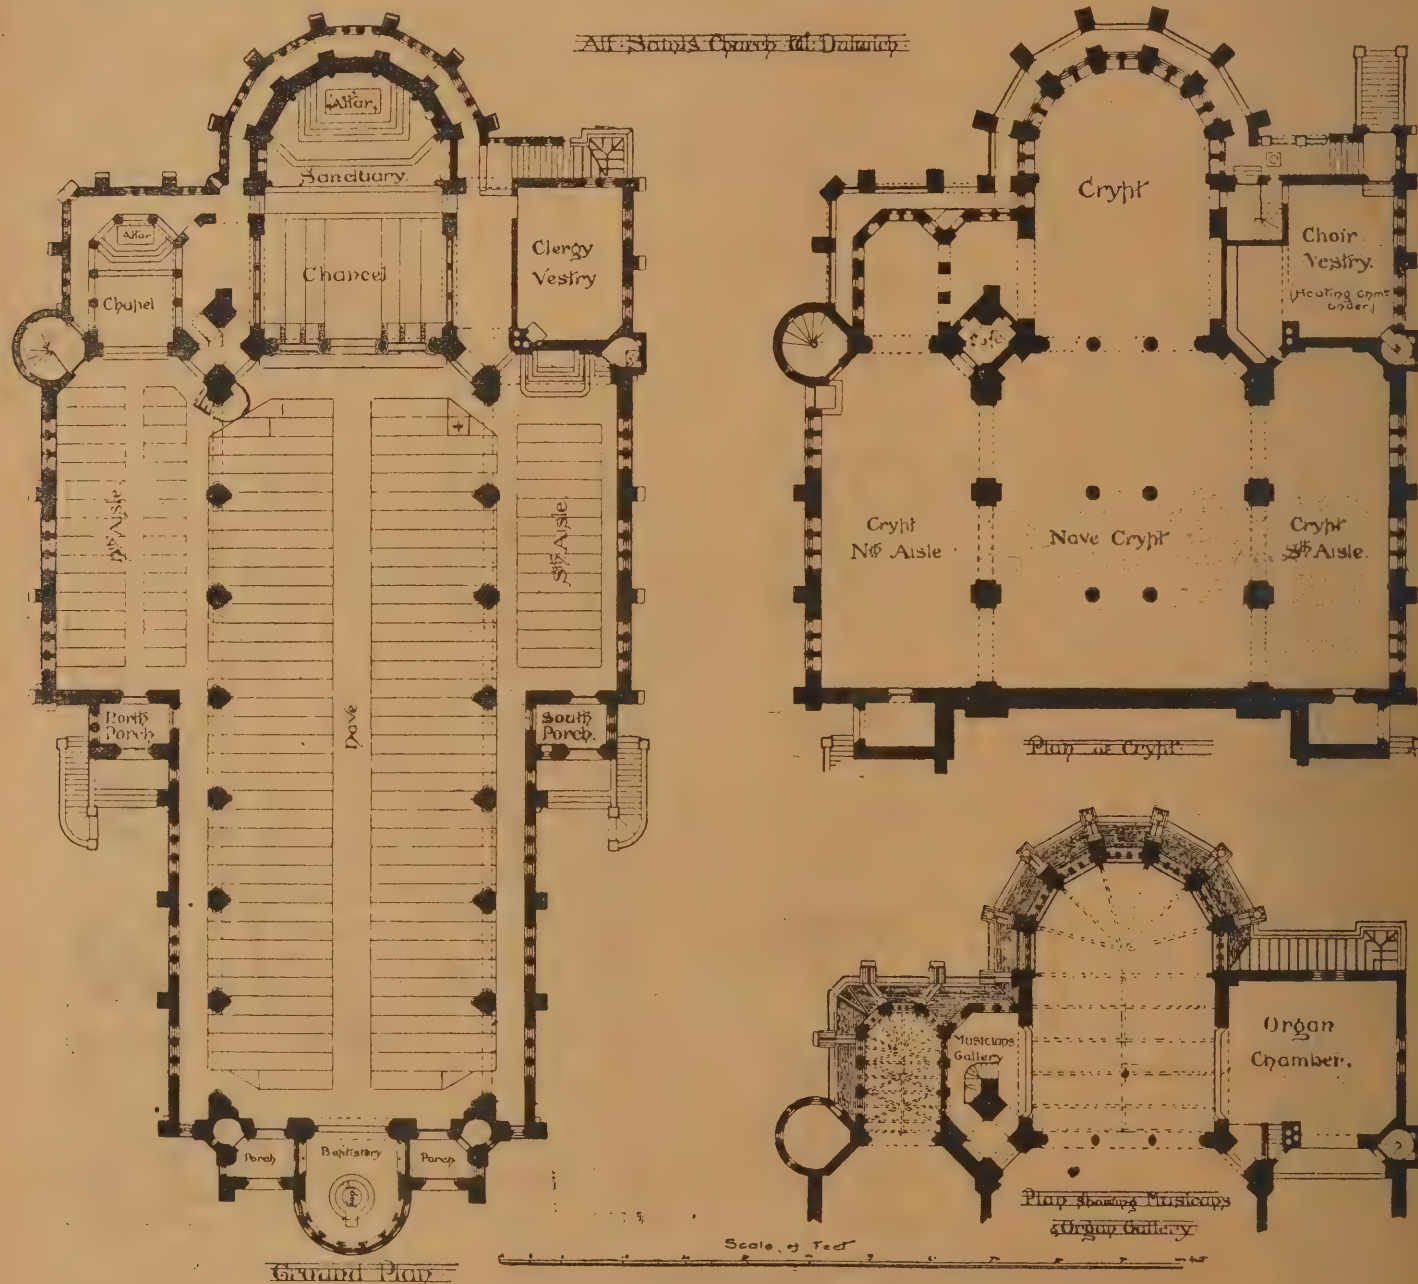

masterpiece of Art, and probably the greatest work (saving that at Norwich) he produced in England. It is a modern Church built—you can imagine—just as an old master would have done it under present-day conditions. Scott, entirely in the spirit of the men of old, seems to have gripped hands with the fellow Artists of every age, and to have wrung from them the secrets of their power which are good for all time. We have said Scott was one of the greatest Architects of our days. Writing now with the memories of the Church of St. Agnes, Kennington Park, or of that other beautiful Church he did in Southwark,

interest that we have at present an appreciation of the "Art of George Gilbert Scott, the Younger" in course of preparation for the pages of *The Architectural Review*, and, although it is perfectly true that no illustrations or writings, however ably done—and we propose commissioning the best Artists and writers of the day to deal with the subject—can ever do entire justice to it, we can, nevertheless, promise that Scott's work shall be treated as it has never been treated before; and, we hope, in a manner worthy of the work. A special announcement concerning it will be made shortly. Meantime we should like to

#### THE AMATEUR ART EXHIBITION.

THE annual Amateur Art Exhibition at 105, Piccadilly, includes a large number of water-colours, specimens of Art needlework, of wood carving, and of artistic work of all kinds. The loan collection, which is exhibited in another room, contains much that is of great interest. A large number of portraits by Count D'Orsay and A. E. Chalon, R.A., have been collected. Among the works by the former artist are the interesting pencil portraits of Dickens, Thackeray, Theodore Hook, Lord Lyndhurst, and other celebrities who flourished in the early part of the Queen's

G. H. FELLOWES PRYNNE, ARCHITECT.

St. Mark's at Leamington, or of that triumph of Architectural Art at Norwich, we no longer hesitate to say that in the production of works such as these he had and has no peer; they are matchless in their beauty and strength and power—incomparable in their reticence of design, and in their Greek-like severity and loveliness of detail. To those who think this talk extreme, let them pay an early visit to any one of the Churches we have named and say where amongst the new or old is work like this to be seen. To those who know and love it—and they, we are afraid, are few—no words are necessary, and the memories of the work appeal in a way no description can. Our readers will, we are sure, learn with

record with pleasure that, amongst all the professional papers, the *British Architect* is the only one that has realised with a true sense of proportion the loss that Architecture has suffered by Scott's death. Other journals think it sufficient to dismiss it with an unsympathetic paragraph, whilst one paper, supposed, until recently, to represent English building, and which used to be looked up to as the authority upon all matters Architectural, passes the event by in complete silence, without even a line of regret or remark. Not, however, that such things matter, for Scott has lit for us and for posterity a lamp of beauty whose light will never fade.

reign. The life-size oil painting of the Queen on horseback is also on view, and the small portrait of Jenny Lind in the character of Norma, which was executed from memory. The statuette of Napoleon by the same artist has been lent by Miss Gurwood. More than fifty works by Chalon are in the exhibition, including portraits of the Queen and the Duchess of Kent, which have been lent by Her Majesty. Fine collections of old English enamels, consisting of quaint little snuff-boxes, étuis, candlesticks, tea-caddies, and other trifles, have been lent by Mr. C. S. Kennedy and Mr. H. R. Fuller, M.D. A case of jewellery contains a number of examples of marcasite necklets and brooches and other ornaments which were once very fashionable.

## Men Who Build.

No. 50.

MR. GEORGE H. FELLOWES PRYNNE.

It is regrettable, but it is none the less true, that to a considerable number of men practising as Architects their profession is their calamity. Thus, in the writer's limited circle of friends, at least four of them are Architects by misadventure. One owes his profession to the fact that his father would not have him "idling about" at home; another became an Architect because he failed for the army; another, because he was the family idiot; and the last because he was deaf, but, it was hoped, not too deaf to draw. No doubt parallel cases might be quoted in other professions, but the anomaly is most common in the practice of Architecture, because, as a profession, its doors stand open, and may be directly entered without those qualifications which embarrass the aspirants to the practice of law and medicine. We all know, too, of those fatuous considerations which pass as plausible reasons for a son being passed from school to an Architect's office. To be "fond of drawing"—to show, for example, capability at hatching horses' heads in chalk, from lithographed copies, with beautiful high lights on the harness done in Chinese white, is popularly a prime qualification for the profession; and the sentiment that attaches in the world at large, naturally enough, to the name of Sir Gilbert Scott, with his knighthood, and his high ascetic associations, and his tomb in Westminster Abbey, has hunted many a young

fellow to the practice of Architecture who better by far had adopted the red coat of his ancestors, or contributed to British enterprise in the Colonies.

Mr. Fellowes Prynne is, however, a notorious exception to any such generalisations. He is quite the other side of the picture. To be passed, as it were, from hand to hand from the school bench to the Architect's stool, has been none of his lot; he has come to his profession, and attained to the position he now holds, from a life in diagonal anthesis to the sentiments of domesticity and Art, and he owes to nothing but his own Artistic convictions, and the inconsistent cultivation and development of his talents in the face of difficulties which very few Architects are called upon to experience.

Mr. Fellowes Prynne, then, who is a Devonshire man, was born in 1853 and educated at St. Mary's College, Harlow; Chardstock College; and Eastman's Royal Naval Academy, Southsea. On leaving school it was his ambition to follow in the steps of his father, who was Vicar of St. Peter's, Plymouth, and take orders; but being disappointed of this hope, at the age of eighteen, he availed himself of an opportunity of joining with a relative in working a farm in the Western States of America. The Western States of America were, in those days—twenty-six years ago—still that literal "wild West" which is now only to be met with decoratively treated by circus troupes, and in the pages of some American writers. The actuality was grim enough. The life of severe physical labour in clearing forest, breaking the virgin prairie, and farming cattle and horses in a temperature that varied between 40 degrees below zero and 100 degrees in the shade; was made

the more arduous and intolerable by rough and brutal surroundings. In those days every man had his bowie knife or his revolver always at hand in his belt, and had to know how to use them. After being himself shot

and put to the torture under the primitive surgical aid that was alone available, and having among other adventures suffered from a shock of lightning, which shattered the barn and the bed in which he was sleeping, and killed a horse in the stable below him; and realising, after nearly two years experience, that a bare living was the best such a country could afford the farmer, Mr. Prynne decided to give up ploughing, and turn his attention elsewhere, and it was with the determination not to return home back to his family "unsuccessful" that he journeyed to S. Catherine's in Canada, and failing employment there, afterwards to Toronto, where he worked in a small Architect's office, and subsequently got an engagement in the office of Mr. R. C. Wyndyer, the best known Architect in the town.

Mr. Prynne was directed in his choice by an old fondness for drawing, a subject in which he had taken prizes in his school days, and by a taste and fancy for Gothic Architecture, roused years before when as a boy he had read in Parker's and Richman's books which chanced his way. Nor was Mr. Prynne altogether ignorant of the reality of practical building, and of some of the ruder methods of construction. His American experiences had included the building of log huts and barns, and even of a rude sort of house constructed of bricks and wood.

In connection with these years of his life, Mr. Prynne always remembers the kindness of Mr. Wyndyer, and the sympathy with which he directed and helped his studies, to this end placing his library and his drawings freely accessible to the young man. Nevertheless it was necessity that stood his hard taskmaster. He had to work for his life, and without any equivocation of the term, for his engagement was that he should work for what he was worth, and it may be imagined that the English schoolboy, fresh from a two years' apprenticeship in the wilds, was worth very little in an Architect's office. During this period Mr. Prynne was perforce an ardent student of Gwilt's encyclopedia, and here we have one of those touches that makes the whole profession kin. In distant Canada, more distant then than now, he enfolded himself in Gwilt in desperation—steeped himself in him; while at home every rightly balanced student was also regularly taking his Gwilt bath before going to bed. So conscientious were his efforts, that after some two and a half years Mr. Prynne won for

ALL SAINTS CHURCH, WEST DULWICH. INTERIOR. G. H. FELLOWES PRYNNE, ARCHITECT.

himself a senior position in the Canadian Architect's office; but this was his last post under Mr. Wyndyer, for very shortly after he was glad to accept an offer made by George Edmund Street of a place in his office. It is of interest that it was Mr. Prynne's father who entrusted Mr. Street with that first opportunity in Church building which started him on his brilliant career; upon its completion, three other commissions for churches fell at once to the young Architect.

Mr. Prynne arrived in London in 1875, and was in Mr. Street's office for two years, afterwards widening his experience by assisting, among others, Mr. R. J. Withers and Mr. Alfred Waterhouse, and he also went through

Mr. Prynne has followed this strong bent of his for ecclesiastical work almost to the exclusion of all other classes of buildings, and he has designed very little even of domestic work. That field of architectural practice wherein the so-called "Specialist" most often looks to find him his bread and cheese in his early days, and from which he is not so eager to escape even when fortune smiles upon him, has been almost ignored by Mr. Prynne. Mr. Prynne is indeed a "Church Architect" in a very much more literal interpretation of the phrase than is usually implied from it, and it is for this reason that the plans and drawings that accompany this article illustrate, with hardly an exception, his Ecclesiastical buildings.

must chiefly remark his wide recourse to the decorative qualities of brickwork, and to effects produced by using it in conjunction with stone; and in face of the attention Mr. Street gave to this subject, and the reliance he placed on the decorative possibilities of this material which he knew how to use so well, one can only suppose that it was in the Architect's office rather than in Italy that Mr. Prynne learned this difficult art of designing richly in brickwork. These remarks apply in chief to his interiors; but in his exteriors Mr. Prynne uses brick with confidence, and dares effects with it which we do not associate with the work of any other Architect. Thus, in the east end of the Dulwich Church this material has been

ST. PETER'S CHURCH, STAINES. BUILT FOR SIR EDWARD CLARKE. G. H. FELLOWES PRYNNE, ARCHITECT.

his term of studentship in the Royal Academy Schools. In these days he read deep in Ruskin, as he is always glad to remember. It was not till 1880, after having travelled in France, Germany, and Italy, where Churches chiefly called for his regard, that Mr. Prynne finally ventured to turn his whole attention to private practice. His first commission was, as he would wish also his last to be, a Church, and consisted in the rebuilding of no other than his father's old Plymouth Church of St. Peter's. Of this, the sanctuary was the work of Mr. Street, and now stands, the rest of the building is Mr. Prynne's design. Since that time he has done a great deal of work in restoration, rebuilding, and the raising of new churches, as will be seen from the list of some of his more important works which we give below. Indeed,

If in viewing these several designs we try to trace the various influences that have combined to form Mr. Prynne's style, we must see that their chief characteristics are personal to himself alone. These distinctive qualities are to be remarked particularly in his well-known Church of All Saints', Dulwich, and in the new Church, Elland, the design for which is now published for the first time. If we were to hazard a guess we would venture that the Architecture that has most appealed to Mr. Prynne has been the Cathedrals of Normandy and the characteristic Gothic of the *Re-de-France*. In comparing his designs with those of Mr. Street, whose office he entered at a susceptible age, and at the receptive period of his return home to a land of Gothic tradition after his New World experiences, we

made without effort to convey some such an impression as we associate with an early French Cathedral.

The most characteristic feature in Mr. Prynne's designs—a feature which we believe is identified with his work—the traceried chancel arch which occurs in so many of his churches, was perhaps the result of the importance with which Mr. Street always regarded his chancel screens, and the amount of attention he gave to his original designing of them; and the forms which Mr. Prynne affects are no doubt an evolution from those of Mr. Street: indeed, one might almost think a reaction on them, for the light, open, lofty designs illustrated in these pages are conceived in a feeling diagonally opposed to that to which we owe the low heavy arcading, and the solid

## St. Peter's Church, Staines.

## Ground Plan.

Scale:

carved Gothic pediments which we associate with the elder Architect. Although his characteristic treatment of the chancel arch originated, and was elaborated entirely from Mr. Prynne's own artistic convictions, he has since discovered that in Essex there are two Churches which have remains of just such a similar decoration, so that this unusual feature of Mr. Prynne's has the authority of tradition. In the interior view of St. Peter's Church, Staines, will be seen a combination of the rood beam with this tracery. This idea Mr. Prynne is developing elsewhere, and if the design be compared with that in the Dulwich Church, it will be seen to be a very distinct improvement on it. The design at St. Peter's has a meaning and importance that is lacking in that at All Saints, and we think that this absence of a distinct intention in a feature which originally had a great deal of meaning, gives the Dulwich design a blankness, and prevents it from being the success it should be.

In the perspective view of the new Church at Elland, which is one of Mr. Prynne's latest designs, the Church being only now building, it will be seen that the Architect has adhered in his plan very closely to that of his well-known Dulwich Church. The ambulatory has indeed been sacrificed to the needs of an English chancel, and the unusual diagonal tower of Dulwich has been omitted, but in other respects the two plans are identical in their governing principles. In the elevations, however, we see at Elland an inspiration from English Gothic, as distinct from the French feeling of the All Saints. Mr. Prynne has, however, held to his pseudo crypt in the new Church, being in this, it would seem, happily favoured by the fall of his site, and he has thus retained an imposing loftiness which compares with that of the Dulwich Church. The following is a list of some of Mr. Prynne's original church designs as distinct from his numerous restorations:—St. Peter's, Budleigh Salterton; St. Peter's, Staines; St. Peter's, Streatham (West End); St. John the Baptist, Horrabridge, Devon; All Saints, Westham, Weymouth; All Saints, West Dulwich; All Hallows, Kea, Cornwall; St. Paul's, Morley. Some now building:—Holy Trinity, Roehampton; St. Saviour's, Ealing. New Church, Elland, Yorkshire; St. John's Church, Sidcup, (new nave); New Church, Battersea.

## RELIC OF OLD NEWCASTLE.

THE proposed scheme of alteration to the Newcastle Exchange was explained to the members a few days ago. Nothing has as yet been definitely decided, but the very idea of

further altering a building that has already seen many changes from, and additions to its original structure suggests many interesting reminiscences. On an ancient plan of Newcastle, by Speed, only one public building is marked on the Sandhill, viz., the old and now demolished Maison de Dieu. Later a proper building was erected for the purpose, and was described by Leland, who visited Newcastle probably in the thirties of the sixteenth century, as "a square haul place for the towne." It was situated on the south side of the Sandhill, and, according to Bourne, was built by the opulent and generous Roger Thornton, who had previously built the Maison de Dieu, to which it was adjacent. But the building was pulled down in 1655, and the present Exchange (or at least a great part of it) was finished in 1658, having attached to it a suite of courts and offices. Robert Trollop, of York, Architect, covenanted with the Corporation, on whose property it stands, to build it for £2000, but Bourne states that he was informed that it cost over £10,000, of which Alderman Weyman gave £1200 by will, the Corporation contributing the rest. Mr. Trollop was presented with the franchise of the Corporation for the skill and ability he displayed in erecting the Exchange, and when he died (being buried in Gateshead Churchyard) the following epitaph was composed concerning him:—

"Here lies Robert Trollop,  
Who made yon stones roll up;  
When death took his soul up,  
His body filled this hole up."

The style of Architecture adopted for the building was a curious mixture of Gothic and Italian, which, in the original state of the

The Annie McDonald has arrived in London with 100 loads of Jarrahdale Jarrah aboard, to the order of McLean Bros. and Rigg, Limited, 1, Fenchurch Avenue, London, E.C.

The building at the entrance to the Maitland, near Inveraray, called the riding school, is being restored, and fitted up as a hall to take the place of the present Castle pavilion.

building, is described as having been very beautiful, though in these days, with our better taste in matters architectural, we should perhaps have thought it incongruous. In the Guildhall are still to be seen some arches and pillars of the original style of the building, but the pillars and arches downstairs had later to be encased in rectangular masonry owing to the signs they exhibited of giving way. The Guildhall was a noble room 92ft. long and 30ft. broad, the floor being laid with chequered marble, and the ceiling adorned with paintings. The windows were all on the south side, and it is noteworthy that so far back as in Mackenzie's time it was suggested that a great improvement would be effected by building up the windows and lighting the place by large domes in the roof. The entrance to the hall was by two flights of steps, each of which ran under an arch from the east and west, and were, on the side next to the Sandhill,

#### ADORNED AND PROTECTED BY BALUSTRADES

such as still exist in the north gallery of the Guildhall. In 1740 the Guildhall received serious damage through the outrages of the mob, in the alarming riot of that year, and in 1791 the west end was damaged by fire. The Council, five years later, determined to repair and modernise the north front, which was taken down, with the old steeple and staircase, and a new front was erected, the pillars in the Exchange and in front of the Court-house being then cased with freestone, and the old windows with stone mullions were replaced with modern sashed windows. In 1809 the south front was treated in corresponding style, and the south side of the Exchange was walled off by the inner range of pillars to accommodate the new subscription news-room. At the east end of the Exchange formerly stood the Maison de Dieu, built in 1412 by Roger Thornton, previous to the erection of the Exchange, and over this was the Merchant Adventurers' Court, but this building with age had grown almost useless, and the hall above became insecure, so that in 1823 it was pulled down, a handsome and classical edifice being erected on the site by the late Mr. John Dobson, the Architect of modern Newcastle. In digging for the foundations, the bottom of the town wall was discovered about 12ft. below the surface and removed. The east part of this beautiful building was semi-circular, and was supported by eight Doric columns, the basement, which was otherwise open at the sides, being converted into a fish market. This splendid market, besides being at that time one of the most splendid

#### ARCHITECTURAL FEATURES OF THE TOWN

—for it was built before the handsome streets were made in the centre of the town—cleared the Sandhill of the lumbering fish-stalls, and widened the entrance to the Quay, which before had been inconveniently narrow. The question has naturally been suggested whether it is altogether indispensable to have the Exchange down on the Quayside; but in answer to this it is pointed out that, while and so long as the coal trade is located on the Quayside and "down street," there the merchants and shipbrokers must remain, and where they are there must be the Exchange. It may yet be shown, however, that Grainger and Dobson were only some 50 or 60 years or so ahead of their time when they proposed to remove the Exchange to the top of Grey Street, and built the magnificent block of the Central Exchange Buildings. The grand staircase to the Merchants' Court was entered from the east piazza of the Exchange, and at the bottom and top were Corporation offices, for the present Town Hall had not then been built, and the Council used to meet in the building, where its chamber still exists pretty much as it used to be, and in which its offices used to be. This Mayor's Chamber is now proposed to be used for the home of the Chamber of Commerce. The staircase was the spot from which John Wesley addressed the crowd from whose violence he was rescued by the courage of a sympathetic fish-wife. The Merchants' Court is a fine square hall on the same floor as the Guildhall, with which communication is obtained through a very

ornate doorway, and is directly above where the old Fish Market was. It has a rich, antique interior, embellished with fine carvings, while the walls bear the coats of arms of famous members of the Guild. Above the fine fireplace are two carvings representing Solomon's judgment and the miraculous draught of fishes, these designs being symbolical of justice and plenty. On the same floor is the old chamber of the Council, with the Mayor's chair and the benches of the aldermen and councillors. This is

#### A MOST QUAIN AND INTERESTING APARTMENT.

Underneath, on the ground floor, is the Exchange, in the vestibule of which is the statue of Charles II., the "Merry Monarch," which it is proposed to move upstairs to the first floor, into what is now the Guildhall; and the suggestion is to throw open the door of the Merchants' Court, thus giving a space for the new Exchange not quite so large as that of the hall beneath, but possessing advantages in the shape of better light and superior facilities for ventilation, in respect of both of which the ground floor is sadly deficient and almost impossible of improvement. The building is Corporation property, and the consent of the City Council would have to be obtained for any steps of the nature proposed. Within the last thirty years several attempts have been made to get improvements effected in the present Exchange, but they have come to nothing. Some years ago there was a scheme to gut the entire building, and build a new Exchange in one large hall from

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

##### PRESIDENT'S ADDRESS.

AT the meeting held on May 12th, Dr. Roward Anderson said: "In the few remarks I have to make before resigning my office of President, I do not feel I can do better than recapitulate, and, if possible, emphasise, some of the questions I have dealt with from this chair—firstly, because if I have anything to say to you, it is better that I confine myself to such subjects as I have thought about; and, secondly, because I consider such questions as I have dealt with are of importance, and should be discussed from time to time by our Association, as an aid to forming public opinion on matters that every community must deal with periodically. When I took office two years ago, one of the questions prominently before the Profession was that of education, combined with efforts to make our occupation a close one. I explained my views fully to you, and I have heard nothing on the other side since to lead me to think differently. At the bottom of this controversy lies a misconception of the nature of our business, as compared with the professions of Divinity, Law, and Medicine. The divine has to subscribe to a creed, his historical and philosophical knowledge of which must be tested. The lawyer has to administer the laws of the country according to the fixed principles and form of those laws, and his qualifying knowledge of such must be

ST. SAVIOUR'S MISSION CHURCH, EALING. G. H. FELLOWES PRYNNE, ARCHITECT.

floor to roof. That was rejected at the time, though no doubt it would have been the most effective and satisfactory way of meeting the difficulty.

ascertained. The physician or surgeon has to deal with disease in all its forms, and none can be successful unless he has acquired an intimate knowledge of the anatomy and

DESIGN FOR ST. ANDREW'S HOSPITAL FOR INCURABLES, WORTHING. G. H. FELLOWES PRYNNE, ARCHITECT.

functions of the body and all its parts, as also of the experience of the past and the various methods used in combating disease. They have not to provide what the public wants, in the same sense as a picture-painter or dealer, or as an Architect in designing a house or other building has to meet the individual wants and desires of a client. You go to men of the professions I have named for what they are certified to possess and to be able to do, and not to dictate to them in what manner you are to be spiritually consoled, or have the law modified and administered, or modified in the settlement of your affairs, or have your physical trouble alleviated, so that in each case your own wishes may be met. The public deal with us on a totally different footing. While it is true that a client may go to one Architect rather than to another because he is known or believed to be a better educated man in his work than others, yet, taken generally, the Architect is but the interpreter of the public's idea of Art at any given time, and he has to provide what the public wants and is prepared to pay for. No compulsory examination or diploma can alter this. The law cannot, and will not, protect the public from bad Art, because the public can and must at all times protect itself, and if it gets bad Art it gets what it wanted, and the only thing it is able to appreciate. The one hope for Art—and I speak of Art in its widest sense—is

#### AN EDUCATED PUBLIC.

When the public is able to distinguish good from bad, and when it comes to look at Art, not as a question of mere ornament and as a thing apart from structural and functional truth, then the bad Architect will naturally disappear, and no artificial aid will perpetuate his kind or find work for him. While little has been heard lately of converting the Architect into a certified professional man, our friend the registered plumber is still well to the front, and he is now asking the Legislature to pass a Registration Bill as a means of protecting the public health against the ravages of the incompetent man. How the passing of such an Act can do this I cannot comprehend. If the Legislature could ensure plumbers good prices for their work, there might be something in it. That registration will prove that a man is competent and be a guarantee to the public that good work will be done is a fallacy; nothing can make a good plumber or any other tradesman but employment on good work and under a competent foreman and master, and receiving proper payment for his work.

c c 2

Stuffing a lad's head with a lot of data about his work will no more make a good plumber than attending a class on navigation will qualify one to take a ship to sea. So far from the public requiring to be protected against the inferior plumber, it is the respectable plumber who requires to be protected against the public. The keen and excessive competition which is stimulated by the demand for cheap work, the pitting of men of substance, experience, and character against men who have not these qualifications, is the real cause of bad work, and, until that state of things is altered, the registered plumber will only intensify the present unsatisfactory state of things. This claim to protect the public health is rather an arrogant one. The plumber is only a link in the chain, and, if registration is necessary for him, it is equally so for other tradesmen. The mason and the Irish labourer who lay the drains are in every respect as important as the plumber, as far as health is concerned. The State cannot protect the public from the incompetent tradesmen unless it controls both parties to the contract—that is to say, the work and the price to be paid for it. To attempt to do this would, of course, be an absurdity. I have looked over the Plumbers' Registration Bill, and all I can see in it is an arrangement for the appointment of secretaries, treasurers, and auditors, and the collection of fees, but nothing whatever that will add to the protection of the public and ensure a higher standard of work; and for this very good reason, which knocks the bottom out of the whole thing, that no provision can be made for ensuring payment for good work. But the State can do and is doing much that is already bearing good fruit in improving everything that concerns public health, and structures of all kinds, by the appointment of Public Health Officers, the passing of Public Health and Police Acts, and by the powers conferred on health officers, borough engineers, and sanitary inspectors. The enforcement by law of these Acts alike against the public, the plumber, and the Architect is the true and only way of bringing about a

#### BETTER STATE OF THINGS.

While I am entirely opposed to all artificial distinction or hall-marking of a man because he has undergone an examination on subjects which are admittedly not those that test the real qualifications that fit a man for his calling, I am all in favour of education. Give every young man a fair opportunity of equipping himself for his life's work, then let him swim or sink on his own merits or want of them.

The young man who has good stuff in him will educate himself up to the standard of his time, because he knows that to do so is the only passport to success. But you must provide the means of his doing this, and, as far as Art work is concerned, that is the reason for establishing our Applied Art School. Every young man cannot get into a workshop or office where good and artistic work is done. He may and often does drift into a place where he learns little or nothing; but that can be to a large extent rectified by attending this school, and, if there is earnestness as well as ability in him, he will get every help and encouragement. This week three students are leaving having been awarded travelling bursaries, and I have such confidence in them that I feel sure they will submit for inspection an amount of work which, both for quantity and quality, will show that the committee has selected the right men. Two of these students are Architects' assistants, and one a furniture designer; and it cannot be too widely known that our system of education makes no distinction between the different occupations of the students—the rewards and prizes at this school can be held by any Art worker. Merit is the sole title that we recognise. Now that I have said something about the student, I have something to say about the public. Our Association does something to educate the public. We do not exist, like other associations,

#### FOR THE BENEFIT OF THE ARCHITECT

only—our strong point is that we exist chiefly for the benefit of Architecture and its allied Arts. The more we can interest the public in Art the better for us and for Art, and, if all other institutes and associations would do as we do, the Architect and his work would be better understood and appreciated. The Saturday afternoon excursions, which are largely taken advantage of by our non-professional members, are most enjoyable, and are always interesting and instructive. The unfailing courtesy with which we are always received shows that the noblemen and gentlemen who throw open their places to us know that we do not come out of idle curiosity, but from a desire to learn from and to appreciate all we see. This year our special thanks are due to the Earl of Hopetoun, Lord Torphichen, Mr. McKelvie of Hatton, Messrs. Scott, Bruce, and Glover, W.S., and Mr. W. W. Robertson of H.M. Board of Works. We have still two excursions before the season closes, and on each occasion I can promise all who come a very pleasant and interesting afternoon. This

is an eventful year in the history of our country; it marks a long period of progress, prosperity, and comparative peace under the beneficent reign of our Gracious Sovereign Queen Victoria, and in all those benefits we have shared. A great

#### ADVANCE IN ARCHITECTURE,

and, indeed, in all the Arts, has taken place during Her Majesty's reign; and much of the improvement may be attributed to the direct influence and fostering care of the late Prince Consort. This Association is, therefore, in common with all the subjects of the British Empire, greatly interested in the question of the day as to the most fitting expression to be given to this thanksgiving and Jubilee for the long and prosperous reign of Her Most Gracious Majesty. I am aware that the suggestion which commends itself most highly at this time is the equipment or endowment of institutions for the relief of the sick and suffering. But, apart from the fact that infirmaries, hospitals, and kindred institutions command at all times national sympathy and support, irrespective of any special occasion like the present, I would like to point out that this is, to a certain extent, beginning at the wrong end. There is a well-known proverb which says that prevention is better than cure. Applying it to this case, I say do something to keep the people healthy and happy in mind and body, and there will be less need for infirmaries, nursing associations, &c., &c. I would, therefore, like in a word or two to repeat what I dwelt on at greater length in a former address regarding the provision of a suitable place of amusement and relaxation for the masses of people whose means do not admit of them procuring such for themselves. In my opinion, nothing could better mark this year of Jubilee, or be more in accordance with the expressed wish of Her Majesty, and the touching letter of the Princess of Wales, in which she pleads that, when schools, hospitals, and other charitable institutions have been properly provided for, the poor should not be overlooked, than the inauguration of a movement to bring into the lives of those whose means are only sufficient for the barest necessities, some of that brightness and pleasure which are the outcome of comfortable and cheerful surroundings and innocent recreation. I think that the institution of a great free place of recreation for the people would be found to have the most potent influence, not only in preserving the people from many habits which lead to loss of health, but in refining and educating them, and in promoting that cheerfulness and contentment of mind which is the enemy to all social disturbances; and I do not think that the municipality could in this year of Jubilee enter on any scheme which would have more far-reaching or more beneficent effects. This evening terminates my occupancy of this chair, and, in saying good-bye to you, I have to introduce to you

MY SUCCESSOR, MR. R. J. ROSS.

Mr. Ross has long been a loyal and active member of this Association, and is well known, not only to all of you, but to a very wide circle outside. His *magnum opus*, which he prepared in conjunction with Mr. McGibbon, another valued friend and member of this Association, will long remain a monument of industry and research. It is now having, and will continue to have, an important influence on Scottish Architecture. When Mr. Billing's work on the Baronial and Ecclesiastical Antiquities of Scotland was published, it disclosed the existence in Scotland of a class of buildings unlike any that had hitherto been illustrated. The publication of this work coincided with a period of great agricultural prosperity and high rents, as a result of which many old houses were enlarged and new ones were built, and all were more or less in imitation of the buildings illustrated in Mr. Billing's work. It cannot, however, be said that this work led to the erection of buildings which mark the recovery of a lost Art, or that the buildings erected at this time were in any way expressive of the social or political state of the time, because all the buildings illus-

trated by Mr. Billing belonged to a time when a house was more or less a castle—a building to keep people out, not one to invite them into—and they were, therefore, not fitting types for buildings erected in a time of peace and prosperity. A great opportunity for a revival of Art was thus lost. The great merit of the work on Scottish Architecture by Messrs. McGibbon and Ross is that it illustrates a large number of buildings not noticed in Billing's work—buildings eminently Scottish, and at the same time eminently domestic in their character. These are the buildings that ought to be studied with a view to their application to present day work, and if we in Scotland are to develop a domestic Art having a distinctly local colour, and we ought to do so, it will be largely owing to the publication of this valuable work."

#### BUILDING AT NEWCASTLE.

AS with other towns, so with Newcastle—as its boundaries are extended many spots with interesting associations are dismantled to make way for new streets and make room for a growing population. The north-east part of the Jesmond Manor House estate, which abuts directly on the Dene, has been bought by Mr. Stephen Easton, builder, who is erecting, from the plans of Mr. J. T. Cackett, Architect, quite a little town of houses. The building of 150 houses in flats (300 single flats) and fifty self-contained houses cannot be without a very great influence upon the house accommodation of the city. The estate is situated east and south-east of the Old Manor House. The new streets are already made. The avoiding of quagmires by the construction of the roads before a single foundation was laid is a very great point, and it is easily to be seen that great care has been taken to give a pleasant appearance and a healthy air-space to the streets, upon which some £2000 or £3000 has been spent. A great public improvement has been made by the widening of Jesmond Dene Road at the bottom of the Estate. Both the flats and the self-contained houses are finished, both externally and internally, in a style very much superior to that of many already existing and larger houses in the neighbourhood. The solid stone bays of the bay windows are built with cornice, frieze, and elaborate mouldings, while the fronts of the houses are built with best Ruabon bricks. The names of the streets of flats are Cavendish Road, Grosvenor Road, and Grosvenor Avenue; and the self-contained houses occupy both sides of Cavendish Place, all of which have back streets. So far as the flats are concerned, each block is in excess of the requirements with regard to space. The sites are all larger than a literal compliance with rules necessitated. In Grosvenor Road the bay windows of the flats are carried up the full height of three storeys, and the upper flats will contain seven rooms each. Opposite the flats on the north side of Cavendish Road will be a row of semi-detached houses in flats just like semi-detached villas, only that there will be one tenant upstairs and another downstairs. Every flat has a proper bath-room, with hot and cold water from a circulating supply. In the case both of the flats and self-contained houses, there is an inspection chamber for the sewers, and a disconnecting trap by which gas from the street sewer is prevented from entering the houses. The roofs are all overshot and handsomely supported by cantilevers, while the masonry of the bay windows is of a very superior order. Without going into details about the internal fittings of the houses (all of which possess the latest conveniences), an instance of the way in which they are fitted is shown by the fact that very substantial and Artistic carved oak mantelpieces are provided in the front rooms of the self-contained houses, a decorative enrichment formerly confined to elaborate mansions. There are gardens at the front and yards behind all the houses, and the flats have three, four, or seven rooms, while the self-contained houses have six, seven, or nine. All the materials used in the construction are of good quality, and altogether the estate is a model one.

#### OLD BRUSSELS.

ONE of the most interesting parts of the Brussels Exhibition will, no doubt, be the quarter where Old Brussels houses have been built up as they appeared in the early years of the present century. A similar idea was carried out at one of the South Kensington Exhibitions, when a street of London houses was built up. The Brussels idea has, however, been carried out on a much more ambitious scale, a series of streets and squares having been laid out on a plot of ground, surrounded by reproductions of the old walls of Brussels. Those acquainted with the history of the city need not be told that it was in 1830 that the Great Revolution broke out, in the course of which a large number of the finest houses in Brussels were destroyed by the infuriated mobs. It has been the aim of the committee to reproduce as many of these houses as possible, so that most of the buildings just reproduced were in existence in 1830 or the decade before. In those days the houses were not numbered, neither was the fancy of the Architect trammelled by the requirements of City Councils or Boards of Works. Consequently the Architecture displays all the pleasing qualities in which experts delight. There being no numbers, the houses were distinguished by the names of the families who lived in them, or by names determined by some idiosyncrasy, or due to propinquity to some public building or well-known landmark. Thus we find houses bearing names such as the "Three Heads," the "Cheval Marin" (which sounds as if the joke about horse marines was of ancient origin), the "Green Dog," and the "Three Virgins." The committee has spared no pains to reproduce with fidelity not only the

#### ARCHITECTURAL FEATURES OF THE PERIOD,

but also the costumes, the attendants in the houses of "Old Brussels" being habited in the styles in vogue early in the century. The gateways of the old town have been carefully copied. In addition to early nineteenth century buildings, there are some old seventeenth and eighteenth century houses, which were still standing in 1830, as well as some which escaped the general destruction of the revolution. One of the finest of the old gates, which was unfortunately destroyed in 1784, was the "Porte de Gand," or "de Flandre." This has been reproduced, as well as the old gateway of the Convent of Jericho, which belongs to the thirteenth century. The house of the "Trois-Têtes" is on the right as the visitor enters the Place Verte. With reference to this, M. Hymans, an authority on Brussels, says that the name was derived from a curious old house of the fifteenth century, which is said to have been used as a place of meeting or refuge by the Jews. Three finely sculptured heads protrude from the upper part of the wall, below them being two niches for statues. The doorway is guarded by two massive caryatides supporting a heavy wooden cornice. Further on the visitor sees the celebrated mannikin fountain. Then comes the Old Butter Market-place, with its series of wondrously diversified little houses, glittering all over with their tinted tiles and slate roofs. In this Market-place stands the "Green Dog," with its belfry in which is a peal of silvery bells. The original "Green Dog" was a sort of public-house and tea gardens, founded in 1705 and pulled down in 1842. In the gardens of the "Green Dog" the people of Brussels were wont to take their pleasure, and indulge in the games of the period. Visitors to the Exhibition will be able to play those same games if they are so inclined, as the "plant" for them has been fitted up just as it was in the early years of the century.

The seawall in front of the Grand Hotel at Lowestoft, which was damaged by the gales in January, has been restored. The new concrete wall is strong and massive. The foundation is taken down 6ft. into the beach, and the structure is strengthened by iron piles driven to a depth of 17ft.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 19th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A REMARKABLE collection of over a hundred paintings and over thirty examples of black and white by Mr. Mortimer Menpes was opened to the public at the Dowdeswell Galleries last week. They represent a year's work in Japan. The painter has not been content with depicting the ordinary everyday tourist aspect of life in Japan—which, by the way, everyone is getting a little tired of, just as they are becoming weary of the third-class Japanese curios, fabrics, and pictures with which England has been deluged during recent years—but he has wandered in the less frequented tracks, he has explored picturesque corners, he has gone behind the scenes and studied the life and character of the people, he has made himself familiar with their country, and has mastered the peculiarities of their race. Throughout the collection one can scarcely fail to be impressed with the fact that the Artist has made a distinct advance in power and colour, in variety of subject, and in vigour of handling since his last exhibition. The whole collection—as well as some thirty drawings in black and white—is full of interest and originality.

THE princely domain of Chantilly, from the Condé branch of the Royal House of France, has been completely restored. The Petit Château, or Capitainerie, had been constructed by Jean Bullant for the great Constable, Anne de Montmorency; the Grandes Ecuries belong to the first half of the eighteenth century; the great saloons containing the pictures—a collection next in importance among French galleries to that of the Louvre—are for the most part entirely new. In these last-named buildings the castellated style of the French Renaissance, as illustrated by Blois, Chambord, Chenonceaux, and other châteaux of Central France, has as much as possible been adhered to. The restored chapel, dating in its origin from the fourteenth century, is decorated with sculpture, wood-carvings, and enamelled faience brought from the Château d'Ecouen; it contains, besides a famous carved altar by Jean Joujon—a name now, alas! having such mournful associations—the Urn in which, according to a fashion that obtained especially during the sixteenth century, the hearts of excessive Condé princes is stated to have been deposited. From Ecouen came, too, that curious series of forty-four stained-glass windows, with the "History of Cupid and Psyche," after Apuleius, which was done for Anne de Montmorency—the cartoons for these being attributed to Michael Cockie.

THE memorandum on the annual estimates issued by the Finance Committee of the London County Council states that the estimates of expenditure for 1896-97 amounted to £2,432,932, and the actual payments in the year amounted to £2,348,225, or £84,707 less than the estimate. The total estimates of expenditure for 1897-98 for the various services on the general and special county accounts show an increase of £19,557 over those of last year. The net charge on the rates for debt

shows a decrease of £40,605. The net debt, which stands at £19,105,942, is less than it was a year ago by £109,459, while an increasing proportion of it is what is known as "remunerative"—for example, the debt incurred for such purposes as tramways and artisans' dwellings. The charge for maintaining Blackwall Tunnel, estimated at £9875, appears for the first time in the estimates, and a provision of £5500 has to be made this year on account of the expenses of the County Council election next March. The Main Drainage Committee contemplate a large expenditure on repairs to sewers, and their estimate is £232,330, as against an actual expenditure last year of £192,384. A penny rate over the whole county is estimated to produce in 1897-98 £150,411.

AN excellent proposal by Mr. J. Spencer Curwen to erect a monument over the grave of the great glee composer, Samuel Webbe, the elder, in old St. Pancras Churchyard, has led to the curious discovery that the tomb and apparently the grave have disappeared. The monument was certainly there a few years ago, and the inscription is likewise preserved in Cansick's "Epitaphs," published in 1869. It is possible that when the churchyard was converted into a recreation ground the tomb was carried away. A subscription has, however, been opened to erect a granite obelisk in Webbe's memory in this churchyard; and the inscription will be identical with that placed on the original monument erected after Webbe's death in 1816.

THE fourth of a series of six lectures on "Ancient and Mediæval Art" was delivered in the Royal Dublin Society's new theatre by Mr. G. Baldwin Brown, M.A., Watson-Gordon Professor of Fine Art in the University of Edinburgh. At the beginning of the lecture Mr. Brown dealt with Hellenistic Art as perfected at Alexandria, and subsequently adopted into the service of the Roman Empire. He described in considerable detail a number of the public works of the Romans, especially in their scientific and artistic aspects. On the screen were shown some beautiful specimens of Hellenistic sculpture, which the lecturer said were specimens of ideal Art. Referring to architectural Art in Rome, he said that Roman buildings were mainly of concrete, faced with various materials, of which marble was the dearest and finest. It was said that Augustus had found Rome brick and left it marble. In reality it was still brick, and only faced with marble. The Romans in their Architecture did not reach the standards of the Greeks. The Roman ornament tended to become florid, yet a good deal of the work of the Augustinian age was admirable. The Romans were consummate masters of the materials which they chose to employ, and their systematic methods enabled them to accomplish an almost fabulous amount of building. Proceeding, he described the modification of Roman building and decoration to suit the needs of the early Christian Church, the meeting-houses of the Christians, and their embellishment. The artistic importance of the early Christian Church was chiefly in its mural designs, most of which were mosaics. The architectural subjects dealt with were illustrated by views, including pictures of the chapels of the catacombs.

THE following is the full text of the memorial addressed to Sir John Gorst on the subject of the South Kensington Museum, and signed by the President of the Royal Academy and many others distinguished in Art:—"To the Right Hon. Sir John Gorst, Q.C., M.P., Vice-President of the Committee of Council on Education.—We, the undersigned, practising various branches of the Arts as a profession, seeing that a committee of the House of Commons, of which you are chairman, has been appointed to report on the South Kensington Museum, venture to address this memorial to you, trusting that you will bring it before that committee, and also that, as the Minister responsible in the House of Commons for the Museum, you will use your influence to give effect to our prayer. The South Kensington

Museum was founded in order that 'all classes might be induced to investigate those common principles of taste which may be traced in the works of excellence of all ages.' The extent to which it has stimulated an interest and educated opinion in Art matters in this country, and the profound impression it has made on the progress and revival of what may be termed the industrial Arts, is well known and acknowledged by all those in a position to judge, not only in this country, but on the Continent and America, where the South Kensington Museum has been avowedly taken as a pattern on which to found various national museums. The extraordinarily valuable collections, which have been enriched by gifts and bequests valued many years ago at more than £1,000,000, cannot, however, be properly arranged or seen, much less studied, owing to want of space; while the external appearance of the Museum is a discredit to the nation. We, your memorialists, therefore earnestly pray that active steps may be taken by Parliament to complete the building; and we share the opinion already expressed that no more fitting national memorial of the sixtieth anniversary of the accession to the throne of Her Most Gracious Majesty could be made than the completion of a museum, which owed its existence to her Royal Consort, and which Her Majesty has declared that she has taken under 'her special and personal protection.'

A CORRESPONDENT writes with reference to the safety of our public halls:—"We have done much, after the terrible catastrophes at the Ring Theatre, Vienna, the Paris Opéra Comique, and the Exeter Theatre, to improve the safety of our playhouses; though maybe the manner in which the improvements have been effected has often been lacking in system, and has even caused much unnecessary friction. It is high time now that the safety of our public halls should also receive more attention, and I would advocate the immediate careful examination of all assembly-rooms before the lesson of the fearful calamity at Paris is forgotten. During this year of celebration our halls are being used to a considerable extent for all manner of purposes in connection with the Jubilee. It would be lamentable indeed if our festivities were associated with any great fatality. Of course the immediate and efficient remedy of the many defects which would be discovered in the majority of our public halls cannot be effected at short notice, but a beginning should at once be made with such small improvements as are feasible. At the very least, there should be no door to a public hall throughout the country that does not swing outwards. Halls having their floors near the ground-level could have extra doors cut, and there is no doubt that supplementary staircases could easily be arranged for in many instances where the floor is on a higher level."

WE congratulate the Select Committee of the House of Commons on rejecting the scheme for spoiling Chelsea Reach. The bill—needless to say it is part of the County Council's scheme of "improvement"—aimed at improving London by depriving it of its most striking bit of riparian foreshore. London has many reaches, as someone has said, but only one bay; and it is a bay in which the brown-sailed barges come and go, and where, not ten minutes' walk from the 'buses and the bustle of the King's Road, you can almost catch a "whiff of the briny," and at least see blue-jerseyed sailormen, on whose tanned faces the spin-drift of the North Sea has beaten not so many hours before. No one who goes down to Chelsea Reach, in the early hours of a spring morning or the late sunlight of a summer afternoon, will ever again say that London has nothing that is picturesque. It was the brilliant design of the County Council to destroy the bold curve of this bay by running a straight line of embankment from one horn to the other. There would be an end of the shingle foreshore, the wharves, the brown-sailed barges. Instead, there would be the usual "walk" on which nobody walks, and several acres of reclaimed land, on which cheap houses, with their cellars in the river ooze,

might be built. Also there would be a very big "job," in both senses of the word, for the Council's famous Works Committee to superintend. On the whole, the House of Commons is wise to return this notable project to its authors.

THE Church of St. Leonard's, Shoreditch, for the restoration of which funds are being appealed for, has considerable value from Artistic and historical points of view. It appears that the very handsome tower and spire require immediate attention, and, as this steeple is the greatest ornament to the neighbourhood, its repair must not be postponed. The present Church dates from the year 1740, and was designed by Dance, a pupil of Wren's. The only portion of the building which is in any way remarkable is the steeple, which, from its height and conspicuous situation, is seen both far and near. There has, it is true, been much debate as to the merits of the design, the writers at the period of its production praising it considerably beyond its deserts—as may be seen by turning to the third edition of Maitland's "History of London"—and later writers condemning it far too severely. Of course, it can scarcely be regarded as an original work, as a much finer design of a very similar kind had been carried out by Wren at St. Mary-le-Bow. It must be acknowledged, too, that the modifications, especially in the way of proportions, introduced by Dance are the reverse of improvements; yet it is a stately work, and one well worth preserving. We have been unable to find out what is the height of the Shoreditch Church tower. Leigh, in his "New Picture of London" (1824), says, "The Church is 75ft. long and 66ft. broad, and the spire is about 70ft. high." This is unintelligible, as it is at least three times that height. The old Church, which fell down, or was pulled down, in 1735, is represented by some engravings in the Guildhall Library. It seems to have consisted of a nave with three aisles, so that its eastern end presented the uncommon features of four gables. It possessed, also, a lofty western tower. Judging from the views it would appear to have been erected in the fourteenth or fifteenth centuries, though there is evidence that a Church stood there in Saxon times.

THERE will shortly be sold, at Messrs. Debenham, Storr, and Sons', in King Street, Covent Garden, by order of the Rhodesia Ancient Ruins Company (Limited), of which Lord Gifford is one of the directors, a collection of ancient treasures, which will excite great interest among archaeologists. It is made up of gold ornaments, such as beads, bangles, rings, necklets, armlets, dagger hilts, and mountings of ancient wands of office, recovered from the ruins of the forgotten cities of Mashonaland and Matabeleland. There are 350oz. of beaten gold, twenty-four carats fine, taken from the ancient tombs and strongholds, much of it from the skeletons direct. Among the most curious of the articles are two rings, with beaded boss in the centre. These rings are, of course, bent out of shape; they are so soft that moderate pressure with the fingers will twist them any way, but they are unmistakable rings, and the singular feature of them is that the skulls of the bodies from whose fingers they were taken were not those of negroes, but were distinctly European. The armlets and necklets are coils of pure gold, from six to ten strands through, and weighing, some of them, as much as 7oz. each. These golden ropes or spiral wires stretch out to any length, quite like ordinary cheap wire. There are two curious gold ornaments whose use is a little uncertain, particularly as one of them was evidently cemented to something else.

IN excavating for new buildings for the Gloucester School of Science, in Brunswick Road, the foundation of the Roman wall has been exposed for a distance of nearly 150ft. There are four courses of huge blocks of oolite from the Cotswolds. The original wall was about 25ft. in height, and must have been of immense strength. It was, undoubtedly, erected before the close of the first century,

for when the second century began the need for it had ceased, the Roman garrison being then moved to Caerleon, in the heart of the enemy's country. Among the objects of Roman date found in the excavated débris are a number of Colchester oyster shells. This delicate bivalve was brought to Britain by the Romans, who, at Colchester, laid beds for its cultivation, and there it has been cultivated ever since. It was essentially an oyster for the officers, not for the common soldiers. At Gloucester its shell is never found west of the Cross, because there the men were quartered, and they had to be content with the native variety; but east of the Cross, where the officers lived, as proved by the richness of the architectural remains, the shells of the Colchester oyster frequently occur.

A COLLECTION such as that comprised in the annual exhibition of water-colours at Messrs. Agnew's Gallery, Dale Street, Liverpool, has a certain quiet dignity very pleasurable to the beholder. Much prominence is still given to rich examples of Peter de Wint, David Cox, Copley Fielding, William Hunt, Prout, Turner, Cattermole, Muller, Birket Foster, Linnell, and the rest; but relatively works by painters like Sir E. Burne-Jones, Mr. Alma Tadema, Mr. M'Whirter, Mr. H. G. Hine, Mr. E. M. Whimperis, Mr. H. Clarence Whaite, and Mr. Alfred Powell are much more prominent. This will commend itself to collectors, for water-colours as a branch of Art is decidedly vigorous, and, with all due deference to the older masters, work is produced now worthy of at least equal respect.

VERY high prices were realised at the rooms of Messrs. Christie, Manson, and Woods, King-street, St. James's-square, when the collections of Early English pictures of Earl Sondes and the Marquis of Normanby were sold. The principal items were:—"Portrait of Mrs. Puget," by T. Gainsborough, 4800 guineas; "Portrait of Mrs. Grove," by G. Romney, 3500 guineas; "Portrait of Anne Kershaw," by G. Romney, 2300 guineas; "Portrait of Mrs. Tickell," by Romney, 2000 guineas; "Lady Anne Fitzpatrick as Sylvia," by Sir Joshua Reynolds, 1800 guineas; "Portrait of a Young Lady," by J. Hoppner, R.A., 1460 guineas.

THE Bishop of London, presiding at the anniversary dinner of the Artists' Benevolent Institution on the 8th inst., proposed "Prosperity to the Artists' General Benevolent Institution." In the old times of the monasteries, he said, some people could spend their days in decorating the walls with frescoes and in illuminating missals, but these places, so necessary to certain classes of the population, were swept away, superseded by the less popular institution of the workhouse. It was impossible to find out the causes leading to success and those to failure. Those who had succeeded best most often wondered how they had done so, and must sometimes think that the public taste was incapable of proper discrimination. The Artist, after filling a canvas with a picture intended to out rival Titian—though it seldom did—found no particular use for the canvas if he scraped the paint off. The statue, which was to convulse the world, could find no place, as fashion changed; even in the garden. It was not everyone who had capacity for illustrating the daily papers, and, as for falling back on teaching drawing, South Kensington produced its own young men, who were adapted for that purpose. Nobody could foretell what the public taste would be. One picture took it, another failed. The Artist's lot was therefore beset with pitfalls from the beginning. Those who had succeeded would frankly admit their great debt to those who had failed. Those who failed in Art through audacious experiments which did not appeal to the public taste were of great value to the Artist himself.

MR. C. B. FOWLER, of Cardiff, under whose superintendence the excavations in the grounds of Cardiff Castle are proceeding, has discovered some very interesting specimens of ancient glass during the progress of the excavations.

Black and white representations of artistically coloured glass must, of course, be very inadequate. This ancient glass found at the Blackfriars and Greyfriars Monasteries, Cardiff Castle, is mostly of fourteenth century period, though several of the patterns are of later date. The glass tints are mostly of jonquil and citron yellow, light greys, browns, and greens, lined with a dark red. The glass was discovered near the foundations of the Churches at the west end, about a yard and a half in area and 3ft. underground, the pieces being piled one over the other in a mixture of clay and old mortar. The glass is very brittle in consequence of its burial for such a number of years, but many of the patterns and tints are still discernible, and represent animals, birds, and foliage, among which are the leopard, eagle, and dove, the ivy, vine, fig, maple, and oak; also the fleur-de-lis. The beautiful Art of glass painting, says Mr. Fowler, is not only restored in our day to the perfect fullness of its ancient splendour, but has also acquired, through the science of chemistry and the great progress latterly made in the Art of design, an amount of technical and æsthetical power far exceeding that which could be formerly called to its aid. Nevertheless, exquisite effects were attained in the olden times, taking into consideration its then more limited capabilities. The early glass painters were very selfish; they worked hard, and experimented a good deal to produce colours, but they not only kept the information they had acquired secret during their lives, they even carried it with them to their graves in preference to leaving it behind to be made use of by their scholars. The colours used in glass painting are oxides of metals or other metallic combinations. The colours laid on, together with the foundations on which they are laid, must, in this Art, be fixed together in a kiln. The proportions of the several ingredients used in the pigments must, in a great measure, be left to the trials and experience of the Artist. The silver, yellow, and red colours are always placed on the back, or the reverse side, of the glass; also illuminating colours and shadows and dark-coloured outlines on the front side, or that which is fixed towards the interior of the Church, the glass being cut with a diamond from cartoons and fired in fire-brick ovens.

LONDON is already being made to look hideous in anticipation of the approaching celebration. Many grand-stands along the route are rapidly approaching completion, although more than five weeks still remain before the great day. This is particularly the case with regard to the Government erections. The National Gallery is made uglier than ever by the erection of a bare timber monstrosity across its front; Palace Yard and Speaker's Green are disfigured by piles of six-inch planks, and Parliament Square is now the battle-ground of builders' labourers. One of the most irritating things is the amount of fine old turf that will be destroyed by the building of these structures. It will take years to restore the lawns of Palace Yard and its precincts.

OF Burke's homes in London, one may point with certainty to the house, No. 37, near to Dryden's, in Gerrard Street, as well as to Nos. 6 and 25, Duke Street, St. James's Square. Whilst lodging in the neighbouring Charles Street he received the memorable letter from Crabbe to which he gave so ready and feeling a response. At an earlier period of his career, having come to London in 1750, and been admitted of the Middle Temple, he lived over Jacob Robinson's shop, at the Pope's Head, next to the Rainbow Tavern, Fleet Street; after his marriage, in 1756, he was in Wimpole Street; we follow him, eight years later, to Queen Anne Street.

MR. RICHMOND, R.A., recently gave an address on "The Mosaic Decorations of St. Paul's Cathedral," in the galleries of the Royal Society of British Artists. The chair was taken by Mr. Wyke Bayliss (President of the Society). Mr. Richmond exhibited a number of full-sized cartoons and smaller drawings to

show the *modus operandi* of his work. He remarked that by this time his experience had become very considerable in a difficult and beautiful Art, and the longer he studied that Art the more enchanting he found its possibilities and the more ennobling its limitations and restrictions. The decoration of the choir of the Cathedral had been finished, and he was now engaged on another part of the building, which he hoped would be completed some time this year. When the Dean and Chapter desired him to submit designs for the decoration of the choir, he was fully determined on certain points. These were, first, that the only material for such decoration was mosaic, because it could be washed without injury—an absolutely necessary precaution under the condition of London's smoke-laden atmosphere. However delightful might be the methods of fresco and tempera painting in the clear air of Italy, or even in country places in England, while London continued to be charged with every destructive acid they were out of the question for St. Paul's. Against pictorial mosaic he resolved to set his face and to adhere to the principles of design and execution which prevailed in Italy, Greece, and Asia Minor during the classical times of the Byzantine Empire, and while adhering in principle to severe methods of design and simplicity of colouring, and making use of the modern spirit of antiquarian research, he decided to follow the precepts of the great masters by being accurate in drawing and, according to his lights, noble in his choice of form. But perhaps his most important point was that our Metropolitan Church must be decorated by English and not by Italian labour. On this point, quite leaving out of consideration any estimate of the qualities of his design, it might in fairness be said that the mosaic work in St. Paul's, laid by English workmen, the materials for it made in England, proved that, however rash it might have appeared to be at first sight to employ them, there need be nothing but congratulation as regarded the choice. He then described in considerable detail the way in which the work had been carried out.

In a few days the Church of St. Mary Woolnoth, in the City, will be handed over to navvies and bricklayers for the purposes of excavation, but no deeper than is necessary for the new subterranean railway. No theological experiment is intended. The value of the ground has now been paid by the company into the hands of the proper authorities, and the workmen will commence operations as soon as possible after next Sunday. It is not proposed to destroy the edifice, but to excavate the station underneath its foundations. This will, of course, entail the closing of the building during the boring operations, which, it is calculated, will occupy nearly two years.

The following letter, signed by four residents at Queen Anne's Gate, has appeared in the Times: "We trust you will permit us to give expression to the feelings of most of the ratepayers of Queen Anne's Gate with regard to the recent arbitrary conduct of the united Vestry of St. Margaret's and St. John's, Westminster. Our street is macadamised; it has been greatly neglected as regards repairs and cleaning; during the long frost two years ago the roadway was much broken up, and has never been properly repaired since. Without in any way attempting to ascertain the views of those living in the street, the vestry announced that the Works Committee had recommended paving with asphalt, and that the vestry had confirmed this. Immediately a protest was drawn up, and numerous signed, showing that streets, neglected as the side streets in Westminster are, become a danger to health when paved with asphalt; that such paving is quite unnecessary in a street where there is no great through traffic; that it tends by resonance to make the street more noisy for those who have offices therein; and that asphalt is very dangerous for horses in frost, in great dryness, and after a sudden shower. After much difficulty this protest was permitted to be read at the general meeting of the vestry on April 28, and it was hoped the matter would be again referred

to the Works Committee for reconsideration, but on the hostile motion of an individual member this reference was negatived by the chairman, without a counting of votes. We feel as ratepayers that our wishes, or at least our protest, should be treated with more consideration by the vestry; and that, if the new system of asphalt for side streets as well as main streets is to be applied throughout Westminster, the vestry should first show that it is capable of organising a proper and constant cleansing of the streets, as otherwise the general health may greatly suffer."

On the Chelsea Embankment, fast approaching completion, stands the edifice erected by Mr. Henry Tate as a gift to the nation. "The gallery," says Mr. Tate, referring to the new building, "is of white Portland stone, and covers about an acre of ground. The date of opening and handing over the building and its contents to the Prince of Wales is not yet fixed, and will not be until H.R.H. has arranged the many demands on his time and decided upon a date. The National Gallery trustees will control the gallery, besides adding to it many of the paintings dating from 1796, and now in Trafalgar Square. There is a possibility of the Chantrey bequest works of Art also being placed in the new building. Only the front portion of the structure will be opened in July. This contains four large galleries, with two smaller ones for pictures, and one room at the main entrance for statuary. At the front apex will be placed an erect statue in stone of Britannia, and a figure of a lion and an unicorn beside it on the front angles. The ground was granted by the Government in accordance with my wish for plenty of room." The collection includes six Millais, six Briton Rivieres, five Orchardsons, and two canvases each of Leighton, Landseer, Alma Tadema, Fildes, and one by Lady Butler.

At a Local Government inquiry held at Bristol, relative to the proposed erection of an infectious hospital beyond the northern boundary of the city, Mr. Charles Kisingbury, divisional inspector of the Great Western Railway Company, objected to the scheme, and indicated important railway developments in the district. The company proposed to make forthwith a new line to provide direct communication between London and South Wales, cutting off Bristol. At Patchway, on the Gloucestershire side of the Severn tunnel, five miles from Bristol, traffic would be concentrated between all parts of South Wales, London, and Bristol. It was likely that 100 engines would be employed at this new depot, requiring a permanent staff of 300 men. The navvies engaged in the construction of the line would be accommodated in huts, but the hands engaged permanently would have to live adjacent to the works. In addition to the houses required, fifteen acres will be built upon for engine sheds. The Duke of Beaufort gave evidence opposing the hospital scheme, and Mr. Parr, solicitor, said it was a cruel invasion, as the district was likely to develop into a second Swindon.

A SINGULAR discovery has been made on Brandon Hill by the workmen engaged in preparing for the erection of the Cabot memorial. In the course of their excavations they met with the bones of two human beings interred in a well-defined grave lying east and west. The Cabot tower is to be placed on the summit of the hill, and will rise from the level platform on which for a good many years have stood the big guns which were trophies of the Russian war. The guns have been moved a little from their former position, and the contractors, Messrs. Love and Waite, began to sink in the middle of the walled enclosure a square pit in which to place the foundations of the tower. For about 10ft. the men cut through "made ground," the natural level of the hill had been raised, and a great mass of earth and rubble piled upon it. But after excavating for 10ft. something far more solid was discovered, viz., the remains of an old wall and outcropping masses of Brandon Hill stone, a material notable for its hardness and durability. To the east of the excavations the workmen still

found they had some earth to deal with, and here they met with the bones forming portions of two skeletons. There appeared to have been something in the nature of a coffin, at any rate fragments of wood were picked up in close association with the bones.

THERE is at present on view at the Grafton Gallery an interesting exhibition of pictures, representative of famous theatrical identities. There you may look upon presentments of the famous ones of the stage, from Mrs. Siddons to Cissie Loftus, from Kemble to Nutcombe Gould, and so on. During the afternoon an elderly comedian, bronzed by Brighton suns, looked in and took up a commanding position in front of Sigismund Goetz's fine picture of John Lawrence Toole. The actor regarded it seriously for a moment, then, turning to a friend, he said:—"Clever, very clever; but has he quite caught the nobility of expression?"

THE coinage of the Latin Union of Europe is to be enriched with a new 20-franc piece, which is something of a fresh departure in the stamp it bears. The new gold piece in question is being struck at the Berne Mint, and for the presentation of Helvetia the artist has chosen a daughter of the people. The head represents a maiden of the cantons, of the strong, free type that may be frequently met with in the mountain villages of Glarus and the Jura. The hair is folded in heavy plaits and fastened in a simple knot over the head, one loose lock falling free over the forehead. The breast kerchief is folded crosswise, leaving the neck open above, and around the shoulders Helvetia wears a necklace of edelweiss, the flower of the snowy heights. To the right and left in the background is the outline of a broken range of mountains, and the stars of the twenty-two cantons are on the edge of the coin. The conception is free, bold, and original, and is said to satisfy the national sentiment, which prefers a daughter of the people as the country's symbol to the legendary William Tell or the temporary President of the Confederation.

"MAY I draw your attention to the state of the picture representing the Martyrdom of St. Thomas a Becket in Canterbury Cathedral?" writes Mr. John Leighton, F.S.A. "It was painted by John Cross, who, it may be remembered, won one of the highest prizes at the Cartoon Exhibition in Westminster Hall. It is not in the bright condition that it ought to be, having hung so long in the Cathedral untouched. It was presented to the Dean and Chapter by a committee, which provided for the widow and children left by a painter of much promise, who was cut off early in his career. As one of that committee, for its protection and conservation I should like to see it as well cared for as the example we gave to the National Gallery. I believe that it is the only picture hung at Canterbury, and I well remember that it had hardly been hung before a pilgrim prostrated himself before it."

THE Exhibition of Dramatic and Musical Art, which has just been opened at the Grafton Galleries, consists of a most interesting collection of portraits, engravings, relics, and play bills illustrative of the history of the stage and music. Our own time is illustrated by some of the finest of modern works, notably Whistler's portrait of Sir Henry Irving as Philip of Spain, Sargent's Ellen Terry as Lady Macbeth, and Herkimer's Beerbohm Tree as Gringore. Collier's Julia Neilson, Tadema's George Henschel, Solomon's Mrs. Patrick Campbell as Paula in "The Second Mrs. Tanqueray," and Edward Long's Henry Irving as Richard, Duke of Gloucester, and as Hamlet—two old Royal Academy favourites—also hang on the walls. France is represented by Madrazo's Coquelin as Don César and Chartran's Sarah Bernhardt. Lord Sackville sends from Knole many of the finest things in the exhibition, notably the lovely portrait of Miss Linley (Mrs. Sheridan) and her brother. It is insured for £30,000. Romney's Sheridan is also here, lent by Colonel Unthank. The Corporation of Stratford-on-Avon has sent Gainsborough's David Garrick, Romney's Titania (whose face is said to have

been done as a portrait of Lady Hamilton), and Phillips's portrait of Mrs. Stirling as Peg Woffington. Sir Henry Irving contributes many interesting pictures from his collection: Sir Thomas Laurence's Madame Vestris and G. F. Cooke, Sir Joshua Reynolds's Jack Bannister, Westall's Imogen, Clint's sketch of Edmund Kean in his dressing-room, Harlow's Trial of Queen Katherine, W. G. Wills's Ophelia and Laertes, and Wageman's T. P. Cooke as Jack Sykes.

THE Christina Rossetti Memorial Fund does not progress as rapidly as the friends of the poetess could wish. At least £200 will be required to cover the cost of the work, which, as has already been stated, is designed to beautify the Church Miss Rossetti attended—Christ Church, Woburn Square. The work, it may be recalled, is to consist of a series of pictures for the reredos, which will be designed by Sir Edward Burne-Jones.

ENGLISH Art is to have a show in Boston in addition to the French Art which is so much sought after all over America. The committee of the Jordan Art Gallery in Boston will, in celebration of Her Majesty's long reign, hold an exhibition of the works of English Painters in both oil and water colour, as a sequel to three previous exhibitions of pictures from the Salon and Champs de Mars. Among the English Painters who will contribute works of their own are Sir E. J. Poynter, Mr. L. Alma Tadema, Mr. Luke Fildes, Sir J. D. Linton, Mr. Hubert Herkomer, Mr. A. C. Gow, and Mr. David Murray.

THE Forth, the Tay, and the Tower Bridges will stand as lasting monuments to the skill of Sir William Arrol, who, by the bye, has rendered valuable assistance in connection with the Royal Institute of British Architects' series of brick-tests. The amount of work he got through during the building of the Tay and Forth Bridges is almost incredible. Rising at four on Monday morning, he was down at the Dalmarnock Works before five o'clock, busy looking over plans and scheming the details of the work in progress there. A hurried breakfast, and he was off to Queensferry. There he met the various heads of departments engaged in the building of the Forth Bridge, and spent the day—and often the greater part of the night—in arranging not only how the more important work, but even how many of the minor details should be carried out, and sometimes personally superintending their execution. Early on Tuesday morning he was over at the Tay Bridge, the work of which he carried on in the same way. Back to Glasgow late on Tuesday night, he was down at the Dalmarnock Works by five on Wednesday morning, ready to start the round as before. On Thursday night he started for London to meet the engineers who prepared the plans there, and to discuss with them on Friday the details of any proposed alterations or amendments. Travelling back to Glasgow on Friday night, he was generally at the work till late on Saturday.

#### ENQUIRY DEPARTMENT.

THE Editor begs to notify that he has decided to open an Enquiry Department for the benefit of professional readers. All questions should be written on one side of paper only, and be marked "Enquiry" on the envelope.

#### ROAD-MAKING.

DEAR SIR,—Can you kindly tell me the difference in the systems of making roads invented by Telford and the system invented by Macadam.

Yours truly,  
S. R.

#### SYSTEM OF MAKING ROADS ADOPTED BY THOMAS TELFORD, C.E., F.R.S.

Telford's plan of making roads was first to level and drain, and then to lay (like the Romans) large stones the round or broad end downwards, as close as they could be set. The points were then broken off, and a layer of

stones about the size of walnuts was laid upon them, and over all a little gravel was spread. In making his great road from Carlisle to Glasgow, which was required to bear very heavy traffic, Telford specified that the bed was to be formed in two layers, with a rise of 4in. towards the crown of the road, the bottom course being formed of whinstone, limestone, or hard freestone, 7in. in depth. These were to be carefully set by hand with the broadest ends downwards, all crossbonded or jointed, no stone being more than 3in. wide on the top; the spaces between were then filled up with smaller stones, packed by hand so as to bring the whole up to an even and firm surface. Over this a top course was laid, 7in. thick, consisting of broken, hard whinstones, none exceeding 6oz. in weight, and able to pass through a ring 2½in. in diameter, and a binding of gravel, 1in. in thickness, placed over all. A drain crossed under the bed of the bottom layer to the outside ditch in every hundred yards.

#### SYSTEM ADOPTED BY MR. MACADAM.

Macadam's plan was to level (and drain, if necessary), and then to lay a bed several inches in thickness of stones, broken into angular fragments; the material best adapted for the purpose being granite, greenstone, or basalt. Upon this a layer of smaller angular stones were laid, and the whole covered with a binding coat of gravel, about 1in. in thickness.

#### GLASGOW TECHNICAL COLLEGE.

##### ARCHITECTURAL PRIZES.

THE list of prizes and certificates awarded in connection with the Glasgow and West of Scotland Technical College, session 1896-97, has just been issued. The Architecture and Building Construction Classes, conducted by Professor Charles Gourlay, A.R.I.B.A., I.A., have been particularly successful. The results are as follows:—

##### ARCHITECTURE.

*Junior Class.*—First Class Certificates: 1, W. F. Finlay (prize); 2, J. A. Ferguson (prize); 3, J. A. McMillan.

##### ARCHITECTURE AND ARCHITECTURAL DESIGN.

*Junior Class.*—First Class Certificates: 1, John Ralston (prize\*); 2, James Mather (prize\*); 3, James M. Alexander (prize); 4, William K. Anderson (prize); 5, Gordon L. Wright; 6, James S. Kay; 7, John Wilson. Second Class Certificates: 8, John McLelland; 9, William J. Lukeman; 10, Hugh McDonald; 11, Alexander Henderson.

*Senior Class.*—\* Prizes in Architectural Design: James McKissack and William S. Moyes. Glasgow Institute of Architects' Prize (value £2 2s.) for Sketches and Measured Drawings (Summer Work): William S. Moyes.

##### BUILDING CONSTRUCTION.

*Junior Class.*—First Class Certificates: 1, James A. Ferguson (prize+); 2, Alexander Craig (prize+); 3, Robert Park (prize+); 4, James W. Martin (prize); 5, John Dunn (prize); 6, David Craig (prize); 7, John McFarlane (prize); 8, John G. Bennett (prize); 9, John R. Johnstone (prize); 10, Thomas Cockburn (prize); 11, Gavin T. MacNaughton; 12, George M. Douglas; 13, John Gourlay; 14, William Kerr; 15, Lawrence J. Lambe; 16, Alexander Livingstone; 17, Duncan Grant; 18, Henry Melville; 19, James McFarlane; 20, Robert Morrison; 21, Alexander Wagstaff; 22, Norman McL. Paterson. Second Class Certificates: 23, Donald McIntosh; 24, Alex. Lindsay; 25, Andrew R. Robertson; 26, William B. Pringle; 27, David Gilchrist; 28, George R. Bryce; 29, John C. Buchanan; 30, George Paul; 31, Julius Bradley; 32, Alexander McLean; 33, William Barr; 34, Murdo Stewart; 35, R. M. Young Hughes; 36, Robert E. Frame; 37, William McFarlane; 38, William Burns; 39, Matthew Steele; 40, Robert McCallum; 41, John McKellar; 42, James R. Twaddle; 43, James Anderson; 44, William M. Taggart.

\* Prizes presented by the Architectural Section of the Glasgow Philosophical Society.

+ Prizes presented by the Glasgow Building Trades Exchange.

*Senior Class.*—First Class Certificates: 1, Colin Sinclair (prize\*); 2, John Ralston (prize\*); 3, Archie Scott (prize\*); 4, Alexander Henderson (prize); 5, James N. Gilmore (prize); 6, James Flett (prize); 7, Malcolm Black (prize); 8, Duncan McKinlay (prize); 9, John Burnside (prize); 10, James Angus; 11, John M. Machattie; 12, James A. Laird; 13, David Martin; 14, Duncan Campbell; 15, Robert Moon; 16, James S. Robertson; 17, James C. Thompson; 18, Robert B. Donald; 19, William H. McLean. Second Class Certificates: 20, James Bunyan; 21, William Young; 22, Robert Craig; 23, John Earley; 24, Charles P. Barrett; 25, Andrew D. Ireland; 26, James Simpson; 27, William H. Murray; 28, James Braid; 29, Alexander Elliot; 30, William Thomson; 31, James Winton; 32, Donald Brown; 33, Alexander B. Kay; 34, Andrew E. Martin; 35, Millar D. Douglas; 36, James Smith.

*Honours Class.*—First Class Certificates: 1, John M. Arthur (prize+); 2, James S. Boyd (prize); 3, John Smith (prize); 4, David Skinner (prize); 5, James H. Mellis; 6, Robert Douglas; 7, John S. Henderson; 8, James Johnstone; 9, Nigel C. R. Howie; 10, James Reid; 11, David M. Girdwood. Second Class Certificates: 12, Archibald Cook; 13, James W. Service; 14, William Aird; 15, William McClelland; 16, George Mathieson; 17, William V. McMahon; 18, Thomas Whyte.

##### QUEEN'S PRIZES FOR SCIENCE SUBJECTS.

*Building Construction* (5 awarded).—James H. Mellis, first place; Wm. K. Anderson, fourth place.

*Light* (2 awarded).—David Robertson, second place.

##### QUEEN'S PRIZES FOR ART SUBJECTS.

*Architecture* (2 awarded).—Thos. A. Moodie, second place.

#### THE BERKELEY HOTEL.

THE Berkeley Hotel has just undergone extensive and important alterations. Adjoining property having been acquired, the proprietors have been enabled to double the size of the restaurant, to increase the accommodation at the hotel by about one-third, and to generally improve the kitchen and offices, whilst the whole of the old building has been redecorated. The restaurant will now consist of a very handsome suite of rooms, designed, decorated, and furnished by Messrs. S. J. Waring and Sons, whose most recent work has been the complete installation of the Hotel Regina at Cimiez, where Her Majesty has spent this year's vacation. The restaurant is now capable of containing seating accommodation for 100 visitors, and the proprietors have adopted the most unobtrusive scheme of decoration and colouring, consisting of half Dutch, half Jacobean treatment, with high oak panelling enlivened by rosewood drops and carving, with gold and crimson leather work above. The whole of the electric lighting work has been carried out by Messrs. Strode and Co., of 48, Osnaburgh Street. The elegant fittings throughout the building are their own design and manufacture. Those in the restaurant and entrance hall are Jacobean in style, and are made in polished bright iron, the reception-room being fitted with handsome gilt Louis XIV. candle sconces. Amongst other works, Messrs. Strode have also supplied and fixed two vertical steam boilers, which are not only the means of supplying steam for all the cooking apparatus, and for heating purposes, but, by an ingenious automatic arrangement, provide a hot-water supply for the hotel of over 1000 gallons per hour if required. An entirely new system of drainage has been laid down by Messrs. Dent and Hellyer, and Messrs. Burke and Company have supplied marble floors and mosaic work. An electric lift has been supplied by the Otis Elevator Company, and Messrs. Shoobred and Company and Messrs. Norton and Company have supplied furniture for the hotel.

\* Prizes presented by the Glasgow Institute of Measurers.

+ Prize presented by the Glasgow Building Trades Exchange.

THE PARTHENON AND THE EARTH-  
QUAKE OF 1894.\*

BY F. C. PENROSE, M.A., F.R.S.

MR. PENROSE said he had undertaken to describe the result of his recent examination of the Parthenon, the object of which was to advise the Greek Minister of Public Instruction, and the Archaeological Society of Athens, as to certain repairs which were required in consequence of the damage done to the building by the earthquake of 1894. Three international consulting Architects—namely, Mr. Penrose himself, Professor Dürm (of Karlsruhe), and M. Lucien Magne (of Paris)—had been appointed to confer with a local committee presided over by M. Cavvadias, the Government Superintendent of Antiquities, and consisting of several Greek members of the Athens Archaeological Society and some associated members, including Dr. Dörpfeld, M. Troump, a resident French Architect, and the Government engineer, M. Balanos, who was to superintend the repairs. Having referred at some length to the principal events which had reduced the building to its present insecure condition, Mr. Penrose went on to say that when he arrived at Athens last year Professor Dürm and M. Magne had already made their reports. The former had gone very fully into the question of the defects and remedies, and his report was a valuable contribution to the study of the subject. That of M. Magne was a brilliant and well-illustrated memoir on the construction and

## ORNAMENTS OF THE TEMPLE

rather than a more technical report on the defects and remedies; but he called attention to one very important detail, namely, the instability of the angles of the pediments. The local committee had already made arrangements for several 14ft. architrave stones being prepared on Mount Pentelicus. The part of the temple which demanded the most immediate attention was the hexastyle portico of the Posticum. The state of the Posticum was such that it was impossible to execute any satisfactory repair without replacing at least five of the architrave stones. Of the six columns composing the portico, four only were free; two of them were more or less embedded in the mass of masonry containing a staircase which was once surmounted by a Turkish minaret. This mass secured the southern columnnade. The architraves supported by the four free columns consisted of twelve stones. Of these twelve, only five were free from very great defects; but if five of them could be replaced with new material, two could be so pinned together to their neighbours that they might be supported sufficiently well.

## THE WORST DEFECTS

were on the eastern side of the portico. With one exception the western stones were sound, which was fortunate, as they supported the portion of the Panathenaic frieze still left on the Temple. With regard to the defective one—namely, that which once connected the north-eastern column with its neighbour—the simplest remedy would have been to replace it with new; but its removal would endanger a portion of the precious sculptures, and it would have to be keyed to a new stone placed alongside of it. Professor Dürm, in his report, suggested that the reason of this part being in so much worse condition than any other, was that the original builders had used for an interior part of the fabric a very much worse material than they had provided for the exterior. It was true that the marble of these architraves was more streaky than could be found on the exterior; but streaky marble of similar quality had endured well on the Temple of Jupiter Olympius. Another and more effective cause could be assigned to it, namely, fire, which had consumed all the inflammable part of the structure, and had very much calcined the whole of the

## SUPERSTRUCTURE OF THE POSTICUM,

as the state of the surface of the marble showed. It had also weakened the lintel of

the great western door, and some of the columns of the Posticum, especially on the eastern side, had also suffered. Many portions of the capitals and of the architrave stones in this part retained traces of iron plugs, which could only have been used to fix some material for the purpose of repairing the surfaces which had been split off by the action of fire. This completely explained why the architrave stones of this portion of the building, although much less subject to ordinary weather vicissitudes, had become so much more cracked than those of the Peristyle. A large piece from the middle intercolumniation fell down in the earthquake of 1894, split off apparently at an ancient flaw. The course of deep stones above the architrave, which formed the back of the Panathenaic frieze, and ranged with it in level, was also very much cracked and dislocated, so much so that only two pieces in the whole length were in a fit condition to be retained. These pieces, however, were neither so difficult to handle nor to replace as the main architrave stones, which had a length of about 13ft. 9in. each. The lecturer then referred to the difficulties attending the removal of the condemned blocks and fixing those which were to replace them, and showed by the aid of diagrams how the operation could be performed. With regard to the lintel of the great western door, the two ends remained in the wall, but the rest was gone, and the place was occupied by

## AN EXCEEDINGLY UNSIGHTLY BRICK ARCH.

This, it was hoped, would be replaced by marble; but there was not the slightest prospect of a 30ft. beam being found, nor could it be brought to Athens with existing appliances. The plan recommended by the lecturer, and accepted by the Athenian Committee, and by Mr. Penrose's French and German colleagues, was explained by a diagram. The insecure condition of the angles of the Temple was to be traced to the great overhanging stones which supported the angular acroteria having a tendency to slip downwards and drag the neighbouring portions of the superstructure with them. The worst crack in the architrave was over the north-west angle column, where, owing to the fall of a large piece at the corner of the abacus, the bearing of the outer stone of the architrave was reduced to little more than a point. Between the fourth and fifth columns, reckoning from the south, a crack through the architrave had been produced by a cannon-shot, and the abacus of the fourth column had been so much shattered that it gave a bearing to no more than about half the thickness of the architraves which rested upon it. The exfoliation of iron cramps connecting the architrave stones at the top had also injured all but one of the vertical joints, but, beyond the breakages of the large splinters which had fallen, the injury at these places did not seem likely to extend. Among the diagrams shown by the lecturer was one illustrating the

## CURIOUS CONSTRUCTION OF PARTS,

and another showing how the angles could be secured from slipping by connecting the great horizontal corner-stones by means of strong gun-metal cramps with the main cornice at a sufficient distance, so as to provide an adequate amount of weight to resist the tendency to slip. Few of the new stones proposed to be introduced would make any difference in the general view of the Temple, and scarcely any of the steel or bronze work; and the new stone could be stained with copperas, so as to be almost indistinguishable from some of the old time-stained marble.—Professor Gardner, who was in Athens at the time of the earthquake in 1894, opened the discussion, endorsing Mr. Penrose's remarks as to the earthquake not being entirely accountable for the damage to the Parthenon, as a minute examination failed to reveal any new cracks, except, perhaps, in one or two minor instances. Therefore he agreed that the earthquake, so far from being an unfortunate disaster, had done good in calling attention to the extremely precarious state of certain portions of the building. The speaker strongly deprecated those mangled remains of columns,

discordant and hideous as they were, being built up again at the north side of the Parthenon. The attempt to build up the old pieces had been very disastrous. Of course, it was quite impossible to rebuild the whole of the Parthenon. There was not sufficient material for it, and to replace the old blocks would simply destroy the symmetry of the building. It was most reassuring to them to hear from such an authority as Mr. Penrose that the repair and restoration necessary was not so extensive as they perhaps had been led to believe, after having noticed the numerous cracks and the seemingly inadequate support of certain of the blocks.—Mr. R. Phené Spiers asked Mr. Penrose if he could explain the

## CAUSE OF THE DISCOLOURATION

of certain parts of the structure—whether it was due to the decomposition of the marble itself, to the discolouration of the iron work, or to lightning. He was sure they all must have heard with very great pleasure that their ex-President had been asked to become a member of the International Committee to deal with the question of the restoration of the Parthenon, and they had the greatest confidence in his judgment. Of course it was a very difficult matter to decide precisely as to how the restoration should be carried out—where they should use iron, where the old material, and where material similar to that which formerly existed; but he did not see why some fresh material should not be used, as it would then become apparent which was old and which was new work. He had pleasure in proposing a vote of thanks to Mr. Penrose. In seconding it Mr. T. J. Willson thought the whole architectural world was to be congratulated on the comparatively small extent of repair and restoration which the Parthenon required.—Mr. John Hebb was glad Mr. Penrose had not favoured a general use of the fragment of columns, the use of which, he was sure, would mean a great injury to the building. He also would have great diffidence in colouring new marble so as to obtain a similarity in appearance with that of the old, though generally he much appreciated the ingenious way in which architraves had been raised, and the way the work of restoration has been carried on in other ways.—Mr. Hugh Stannus wished to ask whether the restoration of the Parthenon might not be carried one or two steps further than had been suggested. Many of the walls at Pompeii were covered with tiles, but in the case of the Parthenon probably cement could be used to advantage in

## PROTECTING THE IRON WORK

from the disintegration of rain and moisture for many years to come. He suggested, further, the advisability of making regular inspection of the Parthenon. Every year, say, it should be someone's duty to examine carefully every wall, and see that there was no crack of any kind through which water could percolate, or the herbage find root, to disintegrate the walls of this noble monument. He submitted for consideration the question whether they might not re-erect some of the old columns. He thought it was a thousand pities that the columns were allowed to lay about as at present. Of course these columns had broken joints, but these defects were equalled by other broken joints up and down the Parthenon. It was melancholy to reflect that the grand building was in two pieces, and he earnestly hoped that they would soon be joined, if even, in the absence of anything better by a sandstone wall.—Mr. A. Payne remarked that the great difficulty as to re-erecting the fallen columns was that they could not be restored to the same condition as those which were at present standing.—Mr. J. M. Brydon wondered how it was that the old Greeks had spent so much time and thought and skill on a frieze which is, and always must have been, so badly seen.—The President spoke very briefly, and the vote of thanks having been carried, Mr. Penrose acknowledged the compliment, and in answering Mr. Spiers, attributed the discolouration of certain parts of the Parthenon to the iron hidden in the marble.

\*Abstract of a Paper read before the Royal Institute of British Architects on Monday night.

## Professional Items.

**BOLSOVER.**—It has been decided to rebuild the Church on the enlarged ground plan, but dispensing with the additional vestry, also abandoning the triforium so far as the seating accommodation is concerned. The triforium arches will remain over the arcade, but there will be no floor, which will dispense with the two turrets that had been provided to get the triforium. The plans agreed upon represent an estimated decrease in the total cost of building of £750, and a decrease in the seating accommodation of 90.

**BRIDLINGTON QUAY.**—The restored chapel of St. Anne's Convalescent Home, which is a brick building, consists of a nave and north aisle, and is in the Early English style of Architecture prevalent in Flanders in the thirteenth century, where brickwork was so largely used. The south windows consist of three lights, and the mullions and tracery above are built of brick without any admixture of stone. The effect is more pleasing than the usual combination of stone and brick. The beautiful arches which separate the north aisle from the nave rest on four octagonal pillars of Roche Abbey stone. The roof is heavily timbered and put together with oak pins, and left plain with tie beams, king posts, &c. The building is lighted by pairs of incandescent lights hung from the roof. The Architect is Mr. C. Hodgson Fowler, Durham; and the builder, Mr. A. Lyons, Norton, Malton.

**CARDIFF.**—The new and imposing synagogue in Cathedral Road was formally opened last Wednesday. The new building provides accommodation for 241 men on the ground floor and 158 women in the gallery. A novel feature of the interior is an arrangement whereby the apse containing the Ark is placed at the same end of the building as the main street entrance, this being the only method of securing the necessary eastward aspect for the Ark. The building has been enriched by two Sephor Torah mantles (Scrolls of the Law), covers, and a cushion.

**CLACTON.**—The Board of Trade has approved of and issued a provisional order for the enlargement of the local pier. The undertaking covered by this provisional order is the lengthening of the pier to such an extent that four large steamers will be enabled to lie alongside at once, a measure of public convenience which is not enjoyed by any other pleasure pier in the Kingdom. The provisional order also covers a scheme for the electric lighting of the new pier and various other improvements.

**EDINBURGH.**—The new club house of the Edinburgh Burgess Golfing Society at Barnton, near Cramond, was formerly opened on the 11th inst. by Lord Rosebery. The club house is two stories in height, and built in the Early English style. On the left of the main entrance is the principal club room, an apartment 51ft. by 31ft., lighted by a couple of oriel windows. Connected with this room are the kitchen, service rooms, and bar. The smoking room is another spacious apartment, the ventilation of which has received special attention. The dressing rooms and lavatories are arranged on the most approved lines. Upstairs a room has been set apart for the use of ladies, who will have access to the balcony by a special entrance. On the same flat there is a billiard room with space for two tables. Hot water heating apparatus, electric bells, and fire-extinguishing fittings throughout, add to the completeness of the building. Suitable accommodation is provided for the resident secretary of the club. The plans were prepared by Mr. R. M. Cameron, Edinburgh, and the premises cost over £6000. Contemplated additions to the course are a residence for the greenkeeper, a caddie's shelter, and stabling.

**ELY.**—It has been decided to build a parish-room in commemoration of the Queen's

Diamond Jubilee at a cost of £800. The room will accommodate 350 persons. The Architects (Messrs. James and Sweet-Escott, of St. Mary Street, Cardiff) have been instructed to proceed with the plans and to invite tenders for the erection of the building upon a site given by Lord Windsor, situate at the back of the post office.

**GAULDRY, FIFESHIRE.**—A building is being erected at Gauldry, in Fifeshire, which is intended as a hall and reading-room. The hall if necessary can be divided by sliding panels into two, giving accommodation for reading-room or like purpose. In addition to the ordinary retiring rooms the block comprises caretaker's house with other offices. The building occupies a commanding site, and is faced with red Dumfriess stone. Mr. Ritchie, Perth, is the Architect.

**GRANGE-OVER-SANDS.**—The Convalescent Home erected by the North-Eastern Counties Friendly Societies at Grange-over-Sands, on Morecambe Bay, has just been opened. The home has been erected at a cost of £4000. It stands in two acres of ground, and commands lovely views of the sea and the mountains of Yorkshire and Westmoreland.

**HASTINGS.**—The Corporation has decided to purchase the works of the local electric light company as a going concern. The price agreed is £58,000, and the plant includes that in use for the illumination of the Front-line and parades.

**HELEN'S BAY.**—The new Presbyterian Church erected at Helen's Bay was opened on the 9th inst. It is built of silurian stone from the Ballygowan quarries, and faced with white granite from Scrabbo. Messrs. Young and McKenzie were selected as Architects, and Mr. Wm. Kerr as builder, and in a short space of time the present edifice, which with the further growth of the district can be enlarged by transepts, was completed. The total cost of the Church was about £1600, and it is proposed to build a tower and new transepts at some future date.

**INVERNESS.**—The alterations to the Free East Church, Inverness, will cost very much more than was at first supposed. Then it was thought that £2500 might cover the alterations, now the cost is estimated at about £4500. The design is by Messrs. Ross and Macbeth.

**KILMARNOCK.**—A design of the building to be erected as a gift to the town for the purpose of a Public Library and Museum has been prepared by Messrs. J. and R. S. Ingram. The style of Architecture adopted is Italian. Taking into consideration the site of Elmbank House, with the trees surrounding it, this proposed building will have a distinctive and characteristic appearance. The building is partly two stories and partly one story in height, the frontage being about 130ft. in length, with a total depth of 114ft. To the right of the entrance hall is the reading-room; adjoining is magazine-room; also ladies' room. On the left of entrance hall is the lending library, corresponding in dimensions to the reading-room; also reference library, librarian's room, with side entrance. Immediately behind the main staircase is placed a lecture hall, 60ft. by 36ft., with platform and gallery at opposite end.

**LEEDS.**—At a meeting of the Highways Committee of the Leeds Corporation on the 12th inst., a deputation attended to urge the desirability of substituting a silent pavement for the granite setts now used in Boar Lane. The noise of the traffic is at present very great, and by the suggested change it would, of course, be greatly lessened, while the committee in adopting it would simply be treating Boar Lane as a portion of Briggate has already been treated. It was decided to accede to the wishes of the deputation, and to put down a pavement of wood, the work to be done when the tram lines are being re-laid in connection with the electric system.

**LOWESTOFT.**—The work of restoring the sea wall in front of the Grand Hotel, at Lowestoft, which has been executed by Messrs. B. Cooke, contractors, of Victoria Street, and the engineer of which was Mr. W. J. Roberts, is now finished. The former wall was not strong enough to resist the force of last January's storm, and was consequently overturned.

**MANCHESTER.**—It is proposed to erect a Church to accommodate a little over 500, at a cost of about £5000, in the new district of St. Aiden. It will, however, be capable of enlargement. Plans have been prepared by Messrs. Preston and Vaughan, Architects.

**MOSS SIDE.**—The public free library and newsroom, recently erected at Moss Side is in every way suitable for its purpose, and has been erected from designs prepared by Mr. Acton, the surveyor to the District Council, the cost being about £3000. It includes a large public room, which may be used for meetings, concerts, &c., a library and newsroom, and, in the basement, class-rooms, in which some of the technical instruction classes held under the District Council may be carried on.

**NORTHWICH.**—The new Technical Schools at Northwich will be opened in July. The schools are the gift of Sir Joseph Verdin, and have been built at a cost of £10,000. They provide for the study of every branch of Art, and rooms will be fitted with machinery to enable practical instruction to be given in mechanical science, plumbing, cookery, and laundry work.

**OXFORD.**—The new block of municipal buildings, which has been in course of erection for the past three years, was opened last Wednesday by the Prince of Wales. The new building stands on the site of the old Town Hall and Corn Exchange; it is 96ft. long by 55ft., and presents a very handsome appearance.

**PAISLEY.**—The plans of the new Drill Hall show a building four stories in height, in the Scottish baronial style of Architecture. Besides the hall proper, which is 130ft. by 80ft., situated on the second floor, the building contains accommodation for the keeper, a room for band practice, storage, officers' rooms, armoury, billiard room, and committee rooms. Entrance is had from the front, but the main doorway is to the west side, immediately adjoining the main building. In a separate erection on the west side of the hall are a gymnasium and lavatories, and on the east side is a Morris tube range, 130ft. long by 12ft. broad. The estimated cost of the whole building, which has been designed by Mr. T. G. Abercrombie, is £8000. It is expected that it will be ready for use by next August.

**PARTICK.**—The new police gymnasium in Meadowside Park was opened recently. The building is a single storey erection of brick with slated roof, 80ft. long, 37ft. wide, and 18ft. high from floor to beams. At both extremities a gallery has been erected of pitch pine. The flooring and ceiling are also of pitch pine, and the entire woodwork has been varnished. At the entrance apartments are provided as library and reading rooms, while at the east-end of the building a dressing-room has been erected containing bath and other conveniences. Adjoining the gymnasium there is a grass plot for outside recreation, with a cinder track encircling it about 180 yards in length.

**STONEHAVEN, N.B.**—Plans have just been sanctioned for the erection of, and additions to, the Episcopal Schools, comprising large classrooms, teachers' retiring rooms, cloak-room and lavatories, also new staircase. The elevation to High Street is of Gothic design, and the front dressings will be of Brechin Stone. The Architect is Mr. J. Augustus Souttar, Aberdeen.

## Trade and Craft.

### "RETENTION" OF A WALL.

The case of *Reg. v. the London County Council* was a motion for a *mandamus* to the London County Council directing it to hear and determine an application. The application was one made by a Mrs. Webster for the Council's consent for the "retention" of a certain wall erected a distance less than the prescribed distance from the centre of the roadway, Pearson's Avenue, Deptford. The facts were these. Mrs. Webster had the wall in question substituted for a wooden fence running between a piece of unoccupied ground and the road. Subsequently on this land she erected stables, the foreyard of which was bounded by the wall. This wall was distant less than 20ft. from the centre of the road, and having become part of a building by reason of the stables being built, the structure became illegal. The London County Council then took proceedings against the builder of the wall, and he was convicted. The wall, however, was not removed, and further proceedings were then taken against Mrs. Webster. After the building was erected she had applied for the consent of the London County Council. It, however, refused to hear the application. An appeal was made to the special tribunal of appeal created under the Act. Objection was taken on behalf of the Council that there was no decision of its given, and, therefore, no appeal would lie. This contention prevailed. The present application was made with the view of being able to get to the tribunal of appeal. The court discharged the rule.

### OVERHEAD TRAMWAY SYSTEM IN GLASGOW.

After a long discussion the Glasgow Town Council has adopted the recommendation by the Tramway Committee that the route from Mitchell Street to Springburn, about two and a half miles in length, should be equipped with the overhead system of electric traction, at a cost of about £20,000. This short route is only to be in the way of an experiment.

### THE GURNEY FOUNDRY COMPANY, LIMITED.

The question of how to apply artificial heat to secure an equable warm temperature at the same time subject to the unwholesome effects of an atmosphere vitiated by the extraction of its health-giving quality, is one which the Gurney Foundry Company (whose agents in Great Britain are Messrs. Samuel, Sons, and Benjamin, 164, Fenchurch Street, E.C.) are doing much to solve in a practical way. Low pressure water circulation—which admittedly secures the nearest approach to the natural diffusion of heat by the sun—is, the Company claims, the key to the situation, and, having combined economy with efficiency, considerable success has attended its enterprise in introducing its new methods in Canada and the United States. It is also claimed that this system of warming will meet every variation of climate, providing a soft, gentle, and adequate temperature, and at a cost, both as regards the original outlay and the cost of maintenance, as low, if not lower, than any system now upon the market. The Gurney Foundry Company manufactures three distinct types of water heaters, and they embrace every modern improvement of value. First of all, the Company manufactures the "Oxford," which is less expensive than the others in original outlay, and is more largely employed in warming medium and small dwellings. The "Double Crown" series works with a direct circulation, and also has the advantage of down draught and long fire travel, the greatest economy ever attained in this class of apparatus being claimed for this heater. The third pattern is the "Defiance," which is adapted for comparatively small work. It is used extensively in hotels, laundries, stables, small conservatories, &c. The same Company also manufactures water and steam radiators in great variety of lengths, widths, and heights. The Gurney heating system has, among other places, been installed at the Tivoli Theatre and Restaurant, the Garrick Theatre, and the Union Bank of London.

### MESSRS. OATES AND GREEN.

We have received from Messrs. Oates and Green, Limited, of Halifax, a copy of their supplementary catalogue containing full information as to their waste water closets and latrines, along with particulars of their general sanitary goods. Messrs. Oates and Green rightly claim special advantages for their patent automatic waste water closet. It is specially worthy of notice that in this system the traps in all cases are fixed clear of the closets and latrines, and that the connecting pipes, increasing in size from the tipper to the trap, provide increased area to allow for friction, retarding the flow, and therefore enabling the whole volume of flush to pass in one solid body. Messrs. Oates and Green's patent anti-fouling cone has proved most efficient—it is made from highly-glazed porcelain—and their overhead tipper boxes with patent concentrating channel are perfectly simple and strong. A specially adapted ventilator for closet and latrine roofs is Smith's patent "Zafila." It is constructed of highly-glazed stoneware, and is impervious to the weather. Messrs. Oates and Green have all the latest improvements in sanitary ware. In drains made with Plummer's pipes solid matter is in continual contact with a stronger and deeper force of water than is the case of a circular pipe of similar dimensions. These pipes are not top-heavy, nor are they inclined to fall to one side. The advantages of strength, &c., are maintained by the circular form of socket. Patent socketless access pipes for making connections or repairs without disturbing the main drain; valve traps; Phillips' patent gully, now made with side inlet; a patent disconnecting channel; the trap of which can be turned in any direction, are a few of the wares illustrated in Messrs. Oates and Green's supplementary catalogue.

### JUBILEE PANEL.

The illustration here given is a reduced facsimile of a terra cotta panel manufactured by Mr. W. T. Chapman, of Cleethorpes. The modelling is in high relief and gives a bold and striking effect, and can be strongly recom-

mended for use in public buildings erected during this Jubilee year. The total measurement is 30in. by 24in., and the panel can be obtained at the low price of twenty shillings. We understand Mr. A. Thacker was the sculptor.

We have received a copy of *Metrical Tables for Engineers, Surveyors, Chemists, Merchants, &c.*, by Frederic Elie Gay, Assistant City Surveyor, Bath. (St. Bride's Press, Limited, 2s.) The book is published to meet the want experienced by readers of Continental technical works "of some concise and portable series of tables that would permit them to rapidly and accurately transpose into the system with which they are most acquainted the values met with, which frequently vary considerably in their expression, according to the professional customs of different countries." The varying standards of metric values have long been a perplexing matter, and a text-book of tables computed on the most universal basis—that laid down by the Standards Commission, 1871-72—ought to meet with a warm welcome. Mr. Gay has accomplished his task with that thoroughness and precision which ensures success.

## SOCIETY MEETINGS.

**London Association of Foremen Engineers and Draughtsmen.**—Mr. A. J. Durston, C.B., R.N., presided at the annual festival of the London Association of Foremen Engineers and Draughtsmen, held at the Cannon Street Hotel. The Society, now widely spread and numerous, was originally formed by a few foremen, not only for comradeship, but also as a means for interchanging knowledge, and it arranges for lectures, followed by discussions, upon mechanical and scientific subjects. Disabled members are assisted, and the unemployed are aided while seeking work.—The Chairman, in proposing the toast of the evening, "Prosperity to the Association," said that the most sanguine engineer at the beginning of this glorious reign would not have dared to predict such an advance as that which had been made.

**Iron and Steel Institute.**—The annual dinner of the Iron and Steel Institute took place at the Hotel Cecil, the president, Mr. E. P. Martin, in the chair. Sir Courtenay Boyle, in proposing "Prosperity to the Iron and Steel Institute," said his connection with the toast showed that there was something more in the relations between the great industries and the representatives of the State than the exchange of despatches to and from Whitehall, and it was a sign of the belief, which was well founded, that the little that could be done by the officers of the State to encourage the commerce and trade of this country would be done heartily, loyally, and zealously.

**Registered Plumbers of Edinburgh.**—The annual meeting of the registered plumbers in the Edinburgh and East of Scotland District was held in the Philosophical Rooms, Edinburgh, recently. Sir Jas. Russell presided.—The report of the Council stated that 62 masters and 54 journeymen had been added to the roll during the year, and that a very successful series of lectures were given during the winter.—The Chairman moved, and Mr. J. W. Wilson seconded the adoption of the report, the Chairman remarking that copies of last year's report were circulated among public health officials, so that there was hope that they might be able to get the public educated to the fact that there was such a thing as a registered plumber. They must hammer into the public that with the registered plumber they had a guarantee that he would practice his craft to the benefit of the public, whereas, with the unregistered plumber, they had no such guarantee.

The Hampstead Guardians have resolved to apply to the Local Government Board for permission to borrow £15,000 for the purpose of erecting the proposed additions to the Hampstead Workhouse.

The opening of the new railway from Tipton St. John's, near Sidmouth, to Budleigh Salterton, took place on Saturday. By this new route to Budleigh Salterton, eighteen miles are saved on the journey from London.

PAINTING with compressed air nozzles instead of brushes is rapidly coming into fashion, because it can be done much more cheaply. As yet the "reform" extends only to the painting of railway carriages.

LORD TOLLEMACHE has undertaken to defray the cost of restoring the chancel of Acton Church, Nantwich. The cost will be £1500, and the work will be carried out so as to preserve the original style of the building, which dates back 900 years.

LORD LLANGATTOCK has offered to the vestry of St. George-the-Martyr, Southwark, a piece of land three-quarters of an acre in size, known as the Paragon, New Kent-road, for £3400 for the purposes of a recreation ground for the parish. Towards this sum he has promised £1000, and the London County Council has agreed to contribute £1700. The Newington Vestry is considering an application to subscribe part of the remaining £700, the site adjoining the parish. The Metropolitan Gardens Association has agreed to lay out the ground.

## Correspondence.

### R.I.B.A. ELECTIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I direct attention to another aspect of these elections?

There are sixteen architectural societies allied to the Institute, but only nine of these at a time are allowed representative seats upon the Council, and this is by an election under the provisions of Bye-law 30. Last year there was no contest; on previous occasions three or four representative candidates were defeated.

If, therefore, four elected President-representatives did not attend even one of the twenty-eight meetings held during their year of office, there is good reason why they should retire in favour of the representatives of other allied societies.

But what those who are acting with me demand is that there shall be periodical retirements from each class of the Council, and that, after his third year of office, each member shall withdraw, unless elected as a vice-president.

We are therefore voting only for the seven new candidates, leaving the present members of the Council and the friends of the old system to decide as to which eleven or more of the present members shall remain in office.

I am, Sir,

A FELLOW OF THE INSTITUTE.

London, May 15th, 1897.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to post postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteen pence.

Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open. Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St  
Strand, W.C.

THE plaster cast of the gigantic statue of Mr. Cecil Rhodes, which is to be erected in Bulawayo, has just been completed, and removed to the foundry at Thames Ditton to be cast.

A NEW organ has been presented to Heaton Parish Church by Mr. Fred Illingworth. The instrument has been built by Mr. Hope-Jones, of Birkenhead, and the action is of the electrical type.

THE plans of Sir A. Blomfield for the restoration of Macclesfield Parish Church, at an estimated cost of £13,630, have been approved, and steps will now be taken to raise the necessary funds.

A FIRE has occurred in Sunderland which destroyed the Mann Quay Works. A plot of land about 150 yards in length was covered by joiners' shops and other workshops, as well as large stacks of timber. The joiners' shop was a very large building, only erected within the past two years, and fitted with the latest and most costly machinery. The damage is estimated at £15,000.

THE Government of New South Wales has finished the large stone dock, which will take in the largest steamers afloat. The Morts Dock and Engineering Company is altering its dock, which, when completed, will be capable of taking in two vessels at the same time.

THE Belfast Chamber of Commerce, after considering the construction of the tunnel between the north of Ireland and Scotland, has passed a resolution that the subject was of national importance, and that the Government should arrange for having borings and soundings made to test its practicability.

## CONTRACTS OPEN.

### URBAN DISTRICT COUNCIL of THAME.

TO GRANITE CONTRACTORS AND OTHERS. The Council invite TENDERS for the SUPPLY of 1200 Tons of BROKEN GRANITE and 120 Tons of GRANITE CHIPPINGS, the whole to be delivered free to Thame Railway Station (G.W.R.) at such times before the 1st of October next, and in such quantities as the Surveyor to the Council shall direct.

The Broken Granite to be 1½ in. gauge, or 2 in. gauge, that is 1½ in. cube, or 2 in. cube (whichever the Council may decide to accept), and no appreciable portion of it to be smaller than the size accepted, or to be composed of flaky flat stones or chippings.

Each person tendering must forward to me with his Tender sample of the material tendered for.

The Council do not pledge themselves to accept the lowest or any Tender. Forms of Tender may be obtained of me, or the Surveyor to the Council, Mr. JOSEPH TOWERS, Chinnor-road, Thame.

Tenders must actually be received by me, endorsed "Tender for Materials," before MAY 26th.

By order of the Council,

Thame, May 3rd, 1897. WILLIAM PARKER, Clerk.

### PARISH OF ST. MARY MAGDALENE, BERMONDSEY.

The Vestry of the above Parish is prepared to receive TENDERS for the SUPPLY of about 30,000 STOCKS, or other Hard Bricks, delivered either in barge alongside the Vestry Wharf, East-lane, or at the Vestry Depot, Spa-road, or in trucks at the nearest Railway Station. Separate prices to be stated in each case.

The bricks shall be sound, hard, well burnt, truly shaped, and free from all defects. Any soft or inferior bricks will not be paid for.

Tenders, endorsed "Bricks," accompanied by sample brick, must be sent to the undersigned not later than TWELVE o'clock on MAY 24th.

FREDERICK RYALL,

Bermondsey Town Hall, Vestry Clerk,  
Spa-road, S.E.,  
May 12th, 1897.

### TO BUILDERS AND OTHERS.

The Streets Committee of the Commissioners of Sewers of the City of London are prepared to receive TENDERS for the CONSTRUCTION of UNDERGROUND CONVENIENCES, for both sexes, in Upper and Lower Thames-streets, according to plans and specification to be seen at the Office of the Engineer to the Commission, in the Guildhall.

Tenders are to be on the forms supplied at the said Office, to be sealed, and endorsed "Tender for Underground Conveniences," addressed to the undersigned, and delivered before TWO o'clock on JUNE 1st, 1897.

Security will be required for the due performance of the contract.

The Commissioners do not pledge themselves to accept the lowest or any Tender.

H. MONTAGUE BATES,

Principal Clerk to the said Commissioners.  
Guildhall, May 12th, 1897.

### HORNSEY URBAN DISTRICT COUNCIL.

#### TO BUILDERS AND OTHERS.

The Hornsey Urban District Council are prepared to receive TENDERS for the ERECTION of WORKMEN'S DWELLINGS (108 houses) at Nightingale-lane, Hornsey.

Plans and specifications may be seen, and forms of Tender and all information obtained, on application to Mr. E. J. LOVEGROVE, C.E., Engineer to the Council, at the offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of Five Pounds being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a bona-fide Tender is not made by the Depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted such sum will be retained by the Council until the contract has been executed by the Depositor, and will be forfeited in the event of his, or his sureties, failing or neglecting to execute such contract, or the bond accompanying same, within seven days after he or they respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form.

Sealed and endorsed Tenders are to be deposited in the Tender-box in my department not later than FOUR o'clock p.m. on MONDAY, MAY 31st.

The Council reserve to themselves the right to decline all, or any, or any portion of the Tenders so sent in.

By order of the Council,

F. D. ASKEY,

Clerk to the District Council.  
Offices, Southwood-lane, Highgate, N.  
May 12th, 1897.

### ERITH, KENT.

#### SEWERAGE WORKS.

##### CONTRACT No. 4.

The Erith Urban District Council invite TENDERS for the LAYING of about 4½ miles of STONEWARE PIPE SEWERS, together with the necessary Manholes, Flushing Appliances, and other Works.

The drawings and specification may be seen, and prints of the estimate of quantities obtained at the Offices of the Engineer, Mr. G. CHATTERTON, M.Inst.C.E., 46, Queen Anne's-gate, Westminster.

A charge of Three Guineas will be made for prints of the estimate of quantities. This sum will, however, be returned to all those sending in bona-fide Tenders.

Sealed Tenders (which must be on the form supplied), endorsed "Erith Sewerage, Contract No. 4, Tender," are to be sent or delivered to me, the undersigned, at the address given below not later than NOON on MONDAY, the 31st MAY inst.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 11th day of May, 1897.

FREDK. PARISH (Solicitor),

Clerk to the District Council.

High-street, Erith.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

## PLANNING OF SMALL HOUSES.

(Continued from page xlii.)

By H. V. LANCHESTER, A.R.I.B.A.

No. V.

THE plans previously published in this series have all been designed for positions in more or less close proximity to town, though some might undoubtedly be adaptable for more open sites; those given this week are intended

all requirements; where, however, the desired spot is lacking in such accommodation, the opportunity arises to erect cottages that are somewhat more suitable.

The plans illustrated have been worked out somewhat on these lines, so as to be adapted either for ordinary occupation, or the occasional use of the town dweller.

No. 11 is a design of about the smallest possible dimensions and simplest construction; the roof would run uninterruptedly from end to end, and the building throughout would be of a very inexpensive character. It would

sort let readily, furnished, in places such as some of the Surrey villages, popular as summer resorts.

All designs intended for country building should study simplicity of design; for example, all unnecessary complications in the roofing should be avoided. Gables are generally to be preferred to hips, especially where the rooms are partially in the roof and dormers would otherwise be required. Chimneys should be grouped together so as to diminish trimming, flashing, &c., to a minimum.

The arrangement of flues in the centre of the building (as in these plans) bring them to the highest part of the roof, thus avoiding the liability to down-blow and the chance of cold and consequently smoky chimneys.

It is not essential that all bedrooms should have fireplaces, but where they are absent, efficient ventilation must be provided.

While it is outside the general scope of my subject to deal in any detailed way with the questions of style and manner of construction, it is as well to remember that with regard to the materials used it is always best to adopt as far as possible local methods and products; these will be much more likely to produce a building harmonising with its surroundings than the forcing of an exotic treatment for the sake of variety. The stone and slate of the north country and the tile and rough cast of the south are both in thorough agreement with the landscape, but would both look equally out of place if their locations were transposed. If timber is plentiful, nothing could be brighter and more satisfactory than good half-timbered work; but it is better to be content with tile hanging or rough cast than to have a shoddy imitation of the timbering with no structural reason for its use. In fact, in all things we must bear in mind that common sense and rational taste will always bring about a more satisfying result than fads and fakements.

SCALE OF FEET

for rural districts. It is difficult for those living in a large city to detach themselves from the rush and bustle of business or social duties without putting a substantial distance between the vortex of town life and their place of refuge. How many men owe their mental and physical well-being to the possession of some little *pied-à-terre* near to river or sea, or else, perhaps, out on the edge of a breezy hill where the wind whistles among the pine trees. As a matter of course, outdoor occupations would fill most of the time, and the housing may be of the simplest, a mere labourer's cottage, if well-built, water-tight, and clean, often meets

unquestionably be a mistake to finish buildings of this class otherwise than in the simplest manner, though of course with good taste and refinement.

No. 12 is slightly larger and would group more picturesquely; laid out somewhat more liberally, it would be suitable for a bachelor's shooting box on a small scale, when the small room on ground floor could be used as an extra bedroom if required.

No. 13 shows a cottage of a class suited for occupation by a bailiff or gamekeeper, but it might also be a convenient size for the holiday retreat of a small family; little houses of this

## RURAL SANITATION.

ABOUT fifty members of the Yorkshire branch of the Sanitary Inspectors' Association visited Dewsbury on Saturday the 8th inst. The Corporation's sewage farm at Southill Nether, where, upon 168 acres, a million and a quarter gallons of sewage is treated daily, was inspected, and afterwards the Refuse Destructor Works, which were described by the Borough Surveyor (Mr. Dearden). Thirty tons of rubbish are destroyed daily at a cost of £11 3s. 1d. per week. The remainder of the afternoon was spent in discussing the subject of cottage sanitation in rural districts and other matters affecting sanitary inspectors and medical officers. Mr. T. Pridgin Teale, the President of the Association, who was in the chair, expressed a hope that certain points interesting to sanitary authorities would be very much advanced at the important Sanitary Congress to be held in Leeds this year. The question of rivers pollution called for serious attention in that

part of the country. He was glad that the West Riding County Council and the county boroughs were seriously endeavouring to prevent the Yorkshire rivers from being stinking sewers. The problem was complicated, and any help the discussion of it in various parts of the country might produce would yield results quite worth

#### NORWICH DRAINAGE SCHEME.

ABOUT three-fourths of the work in connection with the Norwich City Engineer's scheme of main drainage has now been completed. Thirty years ago, extensive sewerage works were initiated and carried out at a very

purpose is divided into six drainage zones, each draining to a pumping station situated underground, and, in all but one case, under the streets. In the low-lying districts the sewers will be on the separate system, whilst the surface-water which runs from the roofs of houses and the streets will flow into surface-water sewers, discharging directly into the river. The intercepting connections between the combined sewers and the new sewage sewers have been specially designed and constructed in such a manner that the ordinary flow of sewage proper, together with surface-water resulting from ordinary rainfalls, passes into the sewage sewers, and thence to the sewage farm at Whittingham. The scheme not only provides for a proper self-cleansing system of sewage sewers in the portions of the city which have been so badly drained in the past, but also for an extensive system of surface-water sewers to prevent the local floodings. Nearly all of the most difficult portions of the work have now been completed. The most difficult was the construction of the sealed main and gravitating sewer across the river at Eyebridge, where the sewers had to be constructed at such low levels as to be below the points or bottom piles supporting the piers of the bridge. In addition to this, the streets through which these sewers had to be constructed were so narrow that great difficulties were incurred for lack of proper room. The same remark applies to the narrow way available for navigation of the river at this point. The works remaining to be done are the construction of the sewage and surface-water sewers in the low level districts. But with the constant extension of the city other works will, of course, be necessitated, which in most cases will simply take the form of extensions of what are provided by the scheme, which has now made such great progress.

#### THE ESTIMATED COST

of the whole was £152,000, and the amount actually spent up to May 4th last, with the amounts which will be due on contracts now in hand, when those contracts are completed, is £112,000, leaving £40,000 for the completion of the works. Taking the works as a whole, very little departure has been made from the lines which were originally laid down in the plans submitted to the Local Government Board and approved by it some twelve months ago. One great change between the scheme which the Council decided upon when it commenced operations six or seven years ago and the scheme which it is carrying

#### NO. 12. COTTAGE

CUBE AT 1° = £40

the trouble. In a paper on "Cottage Sanitation in Rural Districts," he had suggested in the preface, which he was asked to write, the formation of volunteer committees to help small villages to improve their sanitary conditions. Those who thought with him on the matter had outlined a minimum of what they should aim at. Those small rural committees, in their efforts to raise the standard of sanitary habits in small communities, would make mistakes at first, but they would be educated by their work, and become valuable factors in the sanitation of the country.—Alderman Kilburn, the chairman of the Dewsbury Sanitary Committee, thought that the difficulties which property owners and occupiers placed in the way of sanitarians rendered the necessity of educating the people into right ideas of elementary sanitation increasingly important. Though the Dewsbury bye-laws forbade back-to-back houses, modifications allowed dwellings that were practically back-to-back.—Mr. Denham (Tadcaster) feared that the drainage of villages had been much neglected. If all the West Riding treated its sewage like Dewsbury, the River Calder would be much purer. Every village should be drained, and should adopt water-closets. Clergymen were the worst sanitarians. To them an inspector was an intruder. Bye-laws were being adopted for large villages, but every small village should be similarly controlled.—Dr. Watts (Medical Officer of Health for Dewsbury) said that town had great difficulties in dealing with sewage till it got water carriage. Rural sanitary officers who had been beaten with whips should remember that town authorities sometimes used scorpions.—The Mayor remarked that the Corporation had tried to make Dewsbury all that it should be. By means of expenditure upon refuse destructors, sewage disposal works, baths, free libraries, gas, electric light, and other instances of enterprise, it had striven to set an example to neighbouring authorities. He preferred through dwellings to the blocks that were a modification of the back-to-back system, and hoped that, while the sanitary condition of the town was all that it should be, the rates would be reduced and the rateable value of the borough correspondingly increased.

heavy cost, which, whilst generally well designed, having regard to the appliances then available, were, as regards the sewers, badly constructed, and in operation were never successful. The old works consisted, generally, of main outfall and intercepting sewers, with pumping station at Trowse, from which point the sewage was pumped through a cast-iron raising main to the Whittingham sewage farm, which was bought and laid out at that time. The portion of these old works about to be abandoned consists of the outfall penstock and screening chambers at Trowse, the main outfall sewer and most of the intercepting sewers. In

#### NO. 13. COTTAGE OR LODGE

CUBE AT 1° = £52

place of these a new main outfall and intercepting sewer, and an entirely new system of sewerage for the low-lying parts of the city is being constructed, which for this

out now consists in the abandonment of the separate system in certain of the higher levels of the city and the continuance of the existing sewers, where they are in good condition, as

combined sewers. It is very difficult to estimate what would have been the ultimate cost if the original scheme had been carried out in its entirety, but it must have been greatly in excess of what the present scheme will cost. Provision has been made in carrying out the new works for the ventilation of the sewers at points clear of the streets and well away from windows, chimneys, &c., and also for effectually flushing the sewers. Within the past few months a large flushing van, which contains about twelve tons of water, has been brought into use with very satisfactory results as regards many of the old sewers of the city. Improved gulleys of the City Engineer's design are being put in wherever possible, which have the effect of intercepting grit, &c., which formerly found its way into the sewers, and had to be removed by expensive processes. Wherever the new sewers have been completed they have proved most satisfactory, and there will be, when the whole are done, a clear run in every such sewer in the city. The whole of the work has been carried out during the past three years under the supervision of the City Engineer (Mr. Collins).

## Surveying and Sanitary Notes.

ANOTHER section of the main drainage works at Dublin is being proceeded with, the sewer in continuation of that completed in Lower Marlborough Street being gone on with through Lower Abbey Street in the direction of Beresford Place. At present the sewer works extend to the Christian Union Buildings, and excavations to the extent of 21ft. have been made. This sewer will proceed by Beresford Place to Amiens Street, and on to Clonliffe. A large number of men are employed at the works.

CONTINUING the series of sanitary lectures at Cardiff, Mr. E. Foster, chief engineering assistant to the borough engineer, speaking on the "Calculation of areas and cubic space, and the interpretation of plans and sections to scale," explained the methods of measuring various areas and solid figures, and demonstrated some of the formulae used with models. He proceeded to explain the delineation of solids by means of plans and sections, and exhibited drawings of recent public works in Cardiff, including amongst them Clarence Bridge, Sanatorium, Bute Road Police Station, St. Mary Street Market.

THE Bury Corporation Sewage Disposal Works are nearing completion. The top stones of a monster chimney connected with the destructor and sludge-pressing machinery were placed in position a few days ago. The chimney, it is said, will rank amongst the largest structures of the kind in the country. It measures 300ft. in height from the ground line, the diameter at the bottom being 28ft. 6in., and at the top 10ft. 4in. The foundation covers an area of 44 square feet, and is 18ft. below the ground line. The total weight of the structure, including the cast-iron cap and terra-cotta top, is 5000 tons, which gives a pressure of 5631lb. to each square foot of the foundation. About 200,000 bricks were used in the foundation, and 800,000 bricks in the whole structure. The cost is about £3000.

MR. GEORGE MILNE, Sanitary Inspector for Elginshire, has issued his sixth annual report,

in which he says:—The general sanitary state of the county is gradually improving. The removal of abatement of nuisances, the thorough disinfection and cleaning of premises where infectious diseases have occurred, and the remedy of insanitary defects generally, structural or otherwise, have had a beneficial effect on the health of the community. Improvements in the above direction are being accomplished with less difficulty than formerly. People, as a rule, comply more readily with the requirements of good sanitation. Nothing has as yet been done to stop the pollution of the River Lossie and the Tyock Burn by the sewage from the town of Elgin. The condition of the Tyock Burn is a positive nuisance, which can hardly fail to be dangerous to the health of those residing in that locality. For over two years the Town Council of Elgin has had under consideration several schemes for the disposal of the town's sewage, but no practical steps have as yet been taken to carry out any of these schemes.

MR. ROBERT LINDSAY, Sanitary Inspector for Midlothian, has just issued the reports of the various inspectors as to the county and the districts under the jurisdiction of the Midlothian County Council. In his principal report, Mr. Lindsay states that during the year "county affairs have been moving smoothly, and questions connected with insanitary houses, drainage, water, hospitals, common lodging-houses, scavenging, lighting, pollution of streams, dairy improvement, pigeries, consideration of new Public Health Bill, &c., have absorbed much time and received great attention and consideration, and with many of these considerable progress has been made." Perhaps the most outstanding event that the Council had to face was resisting an encroachment upon the county area by the Corporation of Edinburgh. "What effect," says the report, "the city extension may have upon the county, it is impossible meantime to state, but as building is increasing beyond the city boundary, it is anticipated that the loss sustained in that respect may be easier borne than it would otherwise have been." The works connected with the various water and drainage districts throughout the county, it is stated, continue satisfactory, except that there is difficulty in finding sufficient water for three of the water districts, which the committees are anxiously endeavouring to procure.

May 28	Marnhull, Dorset—Erection of New Bridge	Dorset County Council	Clerk, Justice Room, Sturminster Newton.
" 28	Wigton—Erection of Grammar School	Urban District Council	G. D. Oliver, 5, Lowther-street, Carlisle.
" 28	Walthamstow—Alterations, &c., Grosvenor House	Urban District Council	G. W. Holmes, Town Hall, Walthamstow.
" 28	West Ardsley—Erection of Stables, &c., Boyle Hall	Urban District Council	Nelson and Savage, Sun Buildings, 15, Park-row, Leeds.
" 29	Elland Edge, Yorks.—Erection of Stabling, &c.	Urban District Council	C. F. L. Horsfall and Son, Lord-street-chambers, Halifax.
" 31	Hastings—Erection of School	School Board	F. H. Humphreys, 6, Trinity-street, Hastings.
" 31	Levenshulme—Council Offices, Stables, &c.	Urban District Council	J. Jepson, Union-road, Stockport.
" 31	St. Leonards-on-Sea—Erection of Infants' School	Hastings United District School Board	Elworthy and Son, London-road, St. Leonards-on-Sea.
" 31	London, W.—Stables, Lavatory, Walls, &c.	Paddington Vestry	G. Weston, Vestry Hall, Harrow-road, W.
June 2	Knutsford—Additions and Alterations	Guardians	R. J. M'Beath, Birnam House, Sale, near Manchester.
" 2	York—Engine Shed, &c., Haverton Hill	North-Eastern Railway	W. Bell, Architect, York.
" 3	Woking—Erection of New Schools	School Board	Clerk's Office, 4, The Broadway, Woking.
" 7	Morecambe—Erection of Chimney	Urban District Council	J. Bond, Council Offices, Morecambe.
" 8	Balham—Erection of branch Library	Streatham Public Libraries Commrs.	S. R. Smith, 14, York-buildings, Adelphi, W.C.
No date.	Newhaven—Extension of Premises	Indus. Co-operative Society, Limited	E. J. Hughes, Riverside, Newhaven.
"	Brighouse—Buildings at Sewage Works	Corporation	R. M. Fowler, C.E., 1, St. Peter's-square, Manchester.
"	Bircle, Lancs.—Vicarage	Urban District Council	C. H. Openshaw, Architect, Fleet-street, Bury.
"	Painswick—Board School	School Board	W. H. C. Fisher, 6, Rowcroft, Strand.
<b>ENGINEERING—</b>			
May 21	Bury, Lancs.—Eight-Cell Destructor, &c.	Sewage Committee	J. Cartwright, Borough Engineer, Bury.
" 21	Bury, Lancs.—Sludge Presses	Sewage Committee	J. Cartwright, Borough Engineer, Bury.
" 21	Stafford—Supply of Boiler, Royal Brine Baths	Corporation	W. Blackshaw, Borough Hall, Stafford.
" 22	Haslingden—Sludge-Pressing Machinery	Sewage Board	H. L. Hinnell, 41, Corporation-street, Manchester.
" 24	Portrane, Co. Dublin—Heating, Ventilating, &c.	Asylum Commissioners	G. C. Ashlin, 7, Dawson-street, Dublin.
" 24	Northwich—Engineering Works	Weaver Navigation Trustees	Weaver Office, Northwich.
" 25	Alexandria, Egypt—Construction of Iron Swing Bridge	Egyptian Government	Inspector, 3rd Circle, Alexandria.
" 26	London, S.W.—Engineering Works, Grove Hospital	Asylums Board	A. H. Tiltman, 6, John-street, Bedford-row, W.C.
" 27	Carnarvon—Construction of Sea Wall	Harbour Trustees	Harbour Office, Carnarvon.
" 28	Donegal—Construction of Reservoirs, &c.	Guardians	J. L. Devenisty-Meares, Town Hall, Newry.
" 29	Wakefield—Precipitating Tanks, &c.	Corporation	R. Porter, Town Hall, Wakefield.
" 29	Wakefield—Pumping Engine, &c.	Corporation	R. Porter, Town Hall, Wakefield.
" 29	Walsall—Excavation and Erection of Tank	Corporation	J. R. Cooper, Bridge-street, Walsall.
" 30	Hebden Bridge—Construction of two cast-iron Culverts	Urban Council	J. Newton and Son, 17, Cooper-street, Manchester.
June 1	Ashby-de-la-Zouch—Waterworks	Urban Council	G. and F. W. Hodson, Engineers, Loughborough.
" 1	London—Underground Conveniences	Commissioners of Sewers	The Engineer, Guildhall, E.C.
" 2	Petersfield—Construction of Reservoir	Urban District Council	H. T. Keats, Petersfield.
<b>IRON AND STEEL—</b>			
May 21	London, E.C.—Railings, &c.	Shoreditch Vestry	J. E. Dixon, Town Hall, Old-street, E.C.
" 22	Bedwellty, Tredegar, Mon.—Pipes (400 tons)	Urban District Council	J. H. Lewis, Surveyor, Blackwood.
" 24	Tredegar, Mon.—Pipes (405 tons)	Urban District Council	H. F. Wells, Gasworks, Tredegar.
" 25	Brighton—Supply and Delivery of Pipes (1600 tons)	Corporation	F. J. Tillstone, Town Hall, Brighton.
" 25	Cleckheaton—Supply of Thirty-two Retorts, &c.	District Council	J. Armitage, Town Hall, Cleckheaton.
" 25	London, W.—Supply of Steel Girders (about 280 tons)	Great Western Railway Company	Engineer, Paddington Station.
" 25	Willesden—Supply of Pipe Sewers, Manholes, &c.	Urban District Council	O. C. Robson, Public Offices, Dyne-road, Kilburn, N.W.
" 25	Croydon—Wrought Iron Fencing	Urban District Council	Borough Surveyor's Office, Town Hall, Croydon.
" 31	Erith—Pipe Sewers, Manholes, &c.	Urban District Council	G. Chatterton, 46, Queen Anne's-gate, S.W.
<b>PAINTING—</b>			
May 22	Mossley—Painting, &c., Temperance Hall	Urban District Council	J. E. Robinson, 1, George-street, Mossley.
" 22	Willington Quay, Northumberland—Painting, &c., Stephenson Schools	Wallsend School Board	Clerk, Bewicke Schools, Willington Quay.
" 24	Warrington—Painting Iron Rails, Gates, &c.	Cemetery Committee	T. Longdin, Town Hall, Warrington.
" 24	London, W.—Whitewashing and Cleaning Asylum	Central London Sick Asylum	Asylum, Cleveland-street, Fitzroy-square, W.
" 26	Goole, Yorks.—Painting Street Lamps	Urban District Council	C. Chambers, Surveyor, Goole.
<b>ROADS—</b>			
May 21	Kingston-on-Thames—Supply of Flints (3000 tons)	Corporation	Borough Surveyor, Kingston-on-Thames.
" 21	Pattingham, Hull—Supply of Whinstone (annual contract)	Rural District Council	W. H. Snaith, Surveyor, Pattingham.
" 22	Batley—Levelling, Paving, Flagging, &c.	Town Council	O. J. Kirby, Market-place, Batley.
" 22	Bedwellty—Laying of Water Pipes	Urban District Council	J. H. Lewis, Surveyor, Blackwood.
" 22	Grange Town, Middlesbrough—Kerbing, Flagging, &c.	Eston Urban District Council	T. W. Stainthorpe, District Surveyor, Grange Town.
" 22	Hexham—Paving, &c., Cattle Market	Urban District Council	R. T. Surtees, Surveyor, Hexham.
" 24	Morley—Sewering, Levelling, Paving, &c.	Corporation	H. Sykes, Town Hall, Morley.
" 25	Adlington—Seth, Kerbs, Flags	Urban District Council	J. Stanton, Clerk, Chorley.
" 25	Dartmouth—Paving, Kerbing, &c.	Corporation	T. O. Veale, Borough Surveyor, Dartmouth.
" 25	Sale—Excavations, Supplying and Laying Pipes, &c.	Urban District Council	A. G. M. Brath, 4, School-road, Sale.
" 25	Tanfield—Limestone and Slag	Urban District Council	R. Heslop, Burnopfield, R.S.O., Durham.
" 25	Uppingham—Repairing Footways, &c.	Rural District Council	T. Northen, Thorpe-by-Water, Uppingham.
" 25	Wombwell, Yorks.—Sewering, Levelling, Paving, &c.	Urban District Council	J. Robinson, Council Offices, Park-street, Wombwell.
" 25	Church, Lancs.—Supply of Materials (annual contract)	Urban District Council	W. E. Wood, Surveyor, Church.
" 25	West Ham—Pitching, &c.	Town Council	Lewis Angell, Town Hall, Stratford, E.
" 25	Willesden—Road-making and Paving	Urban District Council	O. C. Robson, Public Offices, Dyne-road, Kilburn, N.W.
" 26	Ely—Road Materials (150 tons)	Urban District Council	W. McKelvie, City Surveyor's Office, Ely.
" 26	Hailsham—Supply of Materials	Rural District Council	E. Catt, Jun., Church-street, Willington.
" 26	Thame—Supply of 1200 tons of Granite, &c.	Urban District Council	W. Parker, Clerk, Thame.
" 27	Escrick, Yorks.—Leading Stone, Repairing Roads, &c.	Rural District Council	G. H. Nelson, 1, Museum-street, York.
" 28	Brighton—For Laying Wood Paving	Town Council	F. J. C. May, Town Hall, Brighton.
" 28	Colchester—Supply of Materials, &c.	Rural District Council	J. Ennals, Surveyor's Office, Copford.
" 29	Bebington, Cheshire—Road Diversion	Joint Railway Committee	Engineer, L. and N.W. and G.W. Railway Cos., Birkenhead.
June 1	Carshalton—Road, &c.	Urban District Council	W. W. Gale, Surveyor, Carshalton.
" 1	Folkestone—Road Materials	Corporation	J. White, Borough Engineer, Folkestone.
" 1	Urmston, Lancs.—Paving, Flagging, &c.	Urban District Council	C. C. Hooley, Council Offices, Urmston.
<b>SANITARY—</b>			
May 21	Bury—Sewage Disposal Works	Corporation	J. Cartwright, Borough Engineer, Bury.
" 22	Hexham—Sanitary Pipes	Urban District Council	R. T. Surtees, Surveyor, Hexham.
" 24	Hollingworth—Sewerage Works	Urban District Council	Foster, Son, and Bardsby, 23, John Dalton-st., Manchester.
" 25	Dover—Construction of Sewers	Town Council	H. E. Stilgoe, Town Hall, Dover.
" 26	Uppingham—Building New Culvert, Drain	Rural District Council	T. Northen, Thorpe-by-Water, Uppingham.
" 26	Kersley, Lancs.—Sewering, Bark-street	Urban District Council	T. Nuttall, 20, Market-street, Bury.
" 26	Ramsbottom, Lancs.—Sewers, &c.	Urban District Council	T. Nuttall, 20, Market-street, Bury.
" 27	Featherstone-upon-Hull—Scavenging (annual contract)	Corporation	Inspector of Nuisances, Lowgate.
" 28	Featherstone, Yorks.—Sewerage Works	Urban District Council	G. and F. W. Hodson, Engineers, Loughborough.
July 31	Oporto, Portugal—Sanitary Improvement Works	Corporation	Municipal Town Hall, Oporto.

## COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
June 5	Sheffield—Plans for Proposed New School	£15, £10	Sheffield School Board.
" 16	Morecambe—Designs for Hotel	£100, £50, £25, £15	Baxter and Abbott, Back-crescent, Morecambe.
July 1	Elne, France—Water Supply Scheme	50, 30, 20 guineas	La Marie, Elne, Pyrénées Orientales.
" 31 1898	Bootle—Designs for Technical School	50, 30, 20 guineas	Corporation.
Jan 30	Carlton, Victoria—Children's Hospital	£100, £50, £25	Hospital Governors, Pelham-street, Carlton, Australia.
" 30	Wandsworth—Nurses' Home at Workhouse Infirmary	50 gs. (merged in 5 p.c.), 20 gs., 10gs.	Guardians, St. John's Hill, New Wandsworth.
" 30	Chesterfield—Brewery-street Board School		Managers, School Board Offices, Chesterfield.
" 30	Bexhill-on-Sea—Drinking-fountain and Dog-trough		Hon. Sec. Col. Lane Memorial, Standerton, Bexhill.
" 30	Burnley—Fountain, Queen's Park	£10, £5	Corporation.
" 30	Bury, Lancs.—Art Gallery and Free Library		Corporation.
" 30	Chesterfield—Enlarging Stephenson Memorial Hall	£25, £10	Corporation.

WE hear much complaint from Architects now-a-days, of the unseemly haste in which so much of their designing has to be done. The bad results of working at high pressure are constantly enlarged upon. While realising the inconvenience to himself, the Architect is too apt to show but little consideration in this matter to those working under his control. If a building has to be finished by a certain

building is nearing completion, with the result that the Craftsman has not the chance of doing himself justice. In most cases, when the Architect discovers the time they will take, he contents himself with selecting the most suitable of the stock patterns, and so the building loses in interest. Such work also as polished marble wall linings or staircases should be duly considered, and the detail drawings sent off months before the work has to be fixed. This gives the marble-mason time to select just the right blocks as they come from the quarry, and to let the Architect see and approve of them. Blocks of particularly fine marking can be reserved for prominent positions, and where, perhaps, two or three caps, or other features, are required of a certain colour or grain, there is time to instruct the quarrymen to try and procure what is wanted. When the drawings are delivered at the last moment, the mason has to use such material as he may have in stock. There is all the

delay in its delivery; and if he hurries the quarry owner unduly, that inferior stone is sent; such stone being the only one of the size available at the time. In all such matters as these the Architect can, by a little forethought at the beginning of the work, and with perhaps a little added strain on himself, take care that the pressure of the time limit does not bear so severely on any individual worker as to result in bad workmanship or material. No one knows better than he how destructive haste is to good design; he might bear in mind more often that it is equally detrimental to sound and honest craftsmanship. The Architect always expects to get in his buildings skilful and finished workmanship; he ought, therefore, to do all in his power—and he can do much—to see that the Craftsman have at least the time in which to do their best. The result would, we think, more than compensate for the small amount of extra trouble to the Architect which it might entail. Anyhow there is everything to gain.

GOLD PLATE FOR ST. PAUL'S CATHEDRAL. PRESENTED BY MR. HOOLEY.

MANUFACTURED BY THE GOLDSMITHS' CO. LTD. (SEE PAGE 237).

too early date, naturally all those concerned in its erection must expect to bear their share of the general pressure; but the greater the rush, the greater the need for the Architect to bring all his powers of organisation into play, to see that this pressure does not bear too unequally. There are many ways in which this can be done. For instance, he could make the full-size drawings of the various details, not so much in the order in which the finished work will be wanted on the job, but more in relation to the length of time the various works take to execute after the drawings have been received. On every building there are certain things that can be executed in a few days; the details for these can be kept back, if necessary, till the work is required to be fixed. There are other things, however, such as elaborate brass gas pendants from the Architect's design, for which special patterns have to be made, which take, perhaps, a couple of months after the drawings have been received. In the ordinary way, the consideration of all such fittings is put off till the

difference between a job where every block and slab has been selected to suit its particular position, and time has been spent on the finish of the workmanship, and one where the work has been turned out at a moment's notice, from whatever material happened to be at hand. In stone work there is not, perhaps, quite the same need to be beforehand. Most good quarries can supply at once all that is needed for ordinary work, and there is not the same necessity to select stones for their appearance, though it is necessary to do so for their weathering qualities, &c. Where, however, stones of unusual size and shape are required; it is most advisable to let the masons have details of these—or at any rate the dimensions and purpose for which they are required—as early as possible. The quarrymen can then be instructed to look out for extra large, or extra good blocks. If the Architect at the last moment decides to have, say, a balcony-landing in one stone that was originally taken off and described in the quantities as being jointed in several pieces, he cannot be surprised if there is

#### Peterborough Cathedral and the Protection of Public Buildings.

THE Centralblatt der Bauverwaltung of April 10th, a Berlin official journal relating to Architecture, contains an article by Herr Muthesius, an Architect connected with the German Embassy in London, on Peterborough Cathedral, which may be studied with interest as expressing the views of a dispassionate witness of the recent controversy with regard to the west front of Peterborough Cathedral and restoration in general. Commenting on the scheme put forward by the Society of Antiquarians for preserving the northern gable of the west front, the author compares the scheme to the newly-discovered practice of transferring old paintings to new canvas, by means of which the actual surface of the picture is preserved for centuries by the addition of a canvas backing. After a graceful allusion to the labours of William Morris for the preservation of ancient buildings, the author proceeds:—"English Architects are divided into two hostile camps on the subject of the restoration of buildings. The greater number side with Mr. Pearson,

who has a considerable following among the members of the Royal Institute of British Architects, whilst on the other side are ranged all those Architects who have identified themselves with the new Art-movement. These latter advocate freer and more liberal views with regard to Architecture, and, together with the painters, sculptors, and craftsmen imbued with the new Art tendency, form a considerable body. This body was unanimous in protesting against the pulling down of the gables, and it is pleasant to see the disciples of a new and progressive Art movement holding out the hand of fellowship to the recognised guardians of antiquity—the Archaeologists and antiquarians. Injurious expressions have been indulged in by both parties. Standing aloof from the strife of parties, one cannot but regret the manner in which the question has been solved by the somewhat hasty demolition of the gable in dispute, especially bearing in mind Mr. Pearson's views with regard to restoration. The defeat of the opposing party, it must be borne in mind, is more apparent than real, inasmuch in the course of the controversy they have brought over to their side such a body of public opinion in their favour as will render restorations which are preceded by demolition more difficult in the future. The conflict has, above all things, awakened public interest in the preservation of public buildings to such an extent that it is some compensation for the loss of the northern gable of Peterborough Cathedral. One result of the controversy has been that a Bill was introduced at the commencement of the present Session of Parliament to remove the control of Cathedral Churches from the Dean and Chapter, and vest them in some central authority for the inspection of ancient buildings. The Bill, however, did not emanate from the right quarter, being introduced by a member of a party which is opposed to the privileges of the clergy; the proposal consequently became a mere party question and was defeated. The future of an organised system for the protection of ancient buildings appears to be inseparably connected with the new Art movement, and it is to be hoped that it will steadily progress as that movement has done, and will follow its triumphant course."

#### CELTIC ART.

##### SOCIETY OF ANTIQUARIES OF SCOTLAND.

AT the last monthly meeting of this Society for the present session, the first paper read was a notice of a kitchen-midden at the Den of Dun, Forfarshire, recently excavated by Lieutenant-Colonel H. W. Lumsden, F.S.A. Scot. In the second paper, Dr. James Macdonald gave an account of the discovery of an urn of an uncommon type in Scotland, which was exhibited by Mr. James Mackenzie, F.S.A. Scot. It was found in December 1889 in ploughing a field near the seashore at Craigmond. It stood in the ground upright, the mouth covered by a flat stone, and was nearly full of burnt human bones, the earth round about it being blackened and mixed with charcoal. The burial had been after cremation, and no relics of any kind were found in connection with it. The urn, which is a narrow-mouthed jar, widening to the shoulder, and tapering to the base, stands 14in. high, and is wheel-made, greyish in colour, and unglazed, ornamented only by slightly incised lines running round the shoulder and a band of parallel lines slightly impressed in the clay. It has all the characteristics of Romano-British pottery, of which, during the Roman occupation, there were many manufactories in Britain. In the next paper, Mr. W. A. Craigie discussed the question of the Gaels in Iceland. Mr. Alexander Hutchinson, F.S.A. Scot., Broughty Ferry, read a paper in which he gave notices of several articles of interest which had recently found a resting place in the Dundee Museum. The first was

##### A NATIVE CANOE,

dug out of a single tree which was found imbedded in a sandbank in the Tay in July 1895. It is of oak, 29ft. 2in. in length and 4ft. 3in.

wide at about 6ft. from the stem, and about 20in. deep inside. Like most Scottish canoes, it was fitted with a sternboard inserted in grooves. Indentations on the sides probably indicate the positions of two seats or stretchers, and another in the prow suggested the insertion of a figure-head. The second article referred to was a sharpening stone covered with deeply indented scores or grooves, found in the Sidlaw Hills; and the third was a Beggar's Badge, bearing the arms of Dundee, a pot of three lilies with dragons for supporters and the date 1549, and the legend "Dei Donum." The last article noticed was a flint implement with a peculiar history. When the Dundee whaling vessel Eclipse was engaged in cutting up a recently killed whale in Coutts's Inlet, Davis Straits, one of the knives came in contact with a hard substance imbedded in the blubber about three inches under the surface, which on examination proved to be a lance-head of a dark coloured cherty flint. It is over three inches in length by two inches in breadth, leaf-shaped, with a stem or tang about three-quarters of an inch in length for attachment to a shaft. Flint implements are not now used by the Eskimo, but are still known to have been used, and are regarded as curiosities. In the last paper, Mr. J. Romilly Allen, F.S.A. Scot., discussed the art relations of the early Christian monuments of Scotland with those of Ireland. Referring to the peculiar style of decoration of this period, known as Celtic, which was by some assumed to have had its origin in Ireland, he said it was no doubt true that

#### CELTIC ART

attained its highest excellence in Irish illuminated manuscripts, such as the Books of Kells, Armagh, and Durrow; but it was a relevant inquiry to what extent these illuminators were indebted to foreign sources, and whether the similarities of design on the monuments of the eighth to the eleventh centuries in Scotland, Ireland, England, and Wales might not be accounted for by development on parallel lines rather than by direct derivation. Instancing a series of rubbings taken by Mr. Griffith-Davies from cross-shafts and fragments at Clonmacnoise, which closely resembled the slabs of Perthshire and Forfarshire, he proceeded to point out other resemblances between the Irish and the Scottish monuments generally, alike in their decoration and in the groups of Scriptural figure-subjects which appear on both. The Irish crosses are chiefly found in Leinster and Ulster and are absent from the counties of Kerry, Cork, and Waterford, which contain the Ogam-inscribed pillar stones of the earliest Christian period, and the total number of crosses in Ireland, amounting to about 50, was extremely small as compared with the 300 localities in Scotland, 250 in England, 40 in Wales, and 15 in the Isle of Man that were now on record. The conclusion seemed to be that the pre-Norman crosses of Ireland were later than those of Scotland, England, and Wales, and that this phase of Early Christian sculpture had its origin in Northumbria. The scrolls of foliage on the Irish crosses, and the bird and leaf motives in the Book of Kells, indicated Northumbrian influence. Scandinavian influence had not been detected on the Irish crosses, but was found on the metal work. In conclusion, he considered that the Celtic style was a local variety of the Lombardo-Byzantine style, from which its figure subjects, interlaced work, scrolls of foliage, and many of its nondescript animals were obviously derived.

Mr. C. P. AYRES, of Watford, Herts., Architect and Surveyor, has been elected chairman of the Watford Urban District Council, and has been duly sworn in as a magistrate for the county.

THE St. Pancras Vestry is to erect spacious public baths and washhouses for the north division of the parish. The site chosen, estimated to cost £9000, is in the Prince of Wales Road, near Kentish Town Road, and nearly opposite the site of the projected North-West Polytechnic Institute.

#### THE L.C.C. WORKS DEPARTMENT.

AS already reported, the return which has been presented to the London County Council by the Works Department as to the cost of works completed between March 31st and September 30th, 1896, shows that some very large and serious losses have been incurred. The return relates to fifteen works, in only six of which has the actual cost been below the final estimate, the aggregate saving amounting to £734. On the remaining nine works there has been a total loss of £8260. The most serious loss shown is that upon the execution of some temporary buildings at Colney Hatch Asylum, where the actual cost of the work has exceeded the final estimate by £3827. The original estimate for the work as passed by the Council was £17,500, the final estimate, which included certain additions, £19,114, and the actual cost £22,942. On completion of the job the Works Committee sent in a claim to the Asylums Committee for £2920 for extras, out of which the engineer of the Asylum reported that he could only allow £310. Arbitration was suggested, but ultimately, if the Council consents, the Asylums Committee, in addition to the £310, is willing to pay one-half of the balance for extras claimed. The Finance Committee, reporting upon the application of the Works Committee for an excess vote of £3827, and of the Asylums Committee for an excess vote of £1304 for this work, states that it appears that

#### NO PROPER ESTIMATE WAS PREPARED

or taken out. Another large loss is shown on the Shelton Street dwellings, where the deficiency amounts to £2607, the final estimate for the work being £14,416, and the actual cost £17,028. The lesson, the Works Committee thinks, to be learned from the job is, one of caution in undertaking works which are not of a straightforward character. With reference to the excess vote of £2607 asked for in respect to these buildings, the Finance Committee states that it has already pointed out the exceptional inconvenience attending any excess of cost over estimate in respect of artisans' dwellings erected by the Council, because they are only agreed to by the Council upon carefully-prepared estimates with calculations to show the effect upon the county rate. The excess of cost of £2607 in the present case meant an addition of £103 to the annual charge for interest on the sinking fund for capital outlay which, unless it could be met by increased rents or savings in maintenance and management, would constitute an annual charge on the county rate throughout the loan period of upwards of fifty years. The other losses shown in the return relate to the following works:—Crossness outfall gridiron, where the excess over estimate amounted to £1078 on work estimated to cost £3219; Barking outfall, alterations to pier, excess, £206; Victoria Embankment storeyard wall, £98; Sandy's Row improvement, £345; Battersea river-station causeway, £88. There are also two other minor losses. The aggregate of the fifteen works reported upon shows—final estimate £52,133, actual cost £59,690. This is an

#### INCREASE OF 20 PER CENT.

on the original estimates. In view of the facts disclosed in this report, Lord Onslow has given notice that when the report of the Special Committee on the Works Department comes up for consideration he will move as an amendment to the recommendations:—"That the Council, being satisfied from the evidence submitted and the further report of the Works Committee that work executed for it by the Works Department is not superior in quality to that executed by contractors, and that considerable loss has been sustained in consequence of the operations of the Works Department, resolves that no further work be entrusted to that department, and that it be referred to the General Purposes Committee to consider and report as to the arrangements necessary for the due completion of the works in hand, and for dealing with the central works in Belvedere Road."

## Sheffield New Town Hall.

(By our Special Correspondent.)

ILLUSTRATED.

IN writing a description of the new Town Hall, it should at the outset be stated that the building is not complete. The hall is finished for the present, as far as erection of buildings is concerned; architecturally, however, the Cheney Row front has yet to be continued right along to Norfolk Street, when the somewhat unsightly red brick walls overlooking Norfolk Street courtyard will be shut out of sight. The small range of buildings thus still required bears a very small proportion to the magnificent whole, and, though essential to the artistic completeness of the pile, its absence does not, at present at any rate, detract in any way from the utility of the remainder. At the commencement of his work, Mr. E. W. Mountford, the Architect, was supplied with a complete schedule of the numerous rooms required in the building, but in the five years during which the hall was in course of erection the requirements of Sheffield grew considerably, and it was necessary to depart from the original arrangements in several instances. Bearing this in mind, the architectural incompleteness of the building becomes itself an advantage, for it allows of very considerable extension, while yet keeping within the bounds of the original site.

On the site of the Town Hall there formerly stood New Church Street, and a mass of what in these days would be called slum property. This property was cleared, not to make room for the Town Hall, but as part of a general scheme of improvement, and at first the site was among the surplus lands which the Corporation has periodically offered for sale by auction. The value of the site, which, of course, has not passed through the market

since it was acquired for the purposes of street improvement, is put down at £49,180, and its area is 4920 square yards, so that the land cost almost exactly £10 a square yard.

The general style of the Architecture of the building was described by Mr. Mountford,

century, no existing building having been consciously copied either in whole or in part."

The general idea of the Architect was to obtain the dignity essential for the municipal buildings of a large town, combined with the utmost convenience of internal arrangement and the largest possible amount of light for the interior.

The two principal fronts, to Pinstone Street and New Surrey Street, are separated by a lofty and imposing clock-tower, 200ft. high, at the angle between them; this feature emphasising the long range of the double façade and adding dignity and finish to the whole. On either hand of the clock tower the buildings range away in an effective vista, being grouped together and treated in detail in such a way as to make the general view at once harmonious and picturesque. The design of the building has happily been characterised as "Victorian Renaissance." The details are of Classic form, but as a whole the Architect has aimed at originality, and has obtained it without being either grotesque or archaic. The principal external feature, after the great clock-tower, is the main entrance on the Pinstone Street façade, which is much more imposing and effective than it would have been if Mr. Mountford's first idea had been carried out. Over the semi-circular archway which crowns the steps he originally intended to place two small windows, but the single bold-arched window now appearing there is much more dignified. The archway over the gate is richly panelled, and is flanked by coupled Doric columns supporting a balcony. Octagonal turrets, 7ft. in diameter, flank the lofty gable over the entrance, and in the apex of the gable is a niche containing a statue of the Queen, surmounted by a canopy bearing the Royal Arms. The arms of the city, county, and diocese, and the rose of York, are also introduced into the decoration of this central

E. W. MOUNTFORD, ARCHITECT OF SHEFFIELD TOWN HALL.

when he sent in his designs, as "modern Renaissance, as far as possible English in character and detail, and, so far as he knew, as original as might be in the nineteenth

SHEFFIELD TOWN HALL. SCULPTURE IN VESTIBULE. BY F. W. POMEROY. FROM A PHOTOGRAPH BY BEDFORD LEMERE AND CO.

feature. The entrance itself is 12ft. wide. In the spandrels of the arch are two fine carved figures, representing steam and navigation. Above, over the head of the arch, on the first floor, are carved the City Arms, supported by heroic figures, 11ft. high, representing Thor and Vulcan.

The fitness of internal arrangement was almost the primary consideration which the assessor of the sets of designs sent in entertained when deciding on their respective merits, and the result of this practical criterion is that the designs which came to be actually carried out provide for convenience and utility in a no less conspicuous degree than they provide effectiveness to the eye. There is first the spacious Council Chamber, with Mayoral parlour, reception rooms, and other depart-

feature of the internal arrangement is that each of the municipal departments has its various rooms or offices placed entirely in the space between two of these entrances or adjoining staircases.

Entering the building through the principal entrance, the first feature to attract attention is the pair of fine wrought iron gates, now richly gilded. These are a piece of admirable and artistic work. A very pleasing style of decoration has been carried out, mainly scroll work and foliations, and the grill is treated in the same way as the gates. The work of making the gates was carried out by Messrs. Singer and Son, the well-known Art metal workers of Frome and London.

The principal entrance leads into a vestibule 20ft. wide and 16ft. high. It is paved with

grey Hopton Wood marble, the red Devonshire, the beautiful and lustrous black Ashburton marble from the same county, and the Barrow-in-Furness limestone; the whole presenting a pleasing blend in richness of colour and harmony. The roof of the hall is a dome of enriched fibrous plaster, with a central lantern filled with tinted glass.

Immediately at the head of the staircase is the grand corridor, 150ft. long by 10ft. wide, having marble lined walls, marble floor, and vaulted ceiling. This corridor gives access to the reception rooms on the one side, and to the ante-rooms and council chamber on the other. It is lined, like the central hall, with British marbles, and the floor is a rich floral mosaic. The beautiful groined

SHEFFIELD TOWN HALL: SCULPTURE IN VESTIBULE. BY F. W. POMEROY.

FROM A PHOTOGRAPH BY BEDFORD LEMERE AND CO.

ments. In addition the building contains suites of offices for the Town Clerk's department, the Borough Accountant and his staff, the Borough Surveyor, and the Health, Sewage, and Rivers, and Waterworks Departments. The offices of most of the working departments are on the ground floor or basement floor, and are readily accessible from the street for the convenience of the public. At the same time the uniform corridor arrangement affords every facility for the communication of one department with another. The Council Chamber, Mayor's apartments, and the committee rooms, also the Town Clerk's offices, and several departments whose work is of a more public character, such as the waterworks and rate-collecting offices, are situated on the first floor, while the second and third floors are occupied by numerous offices in relief of the accommodation provided for the various departments below. From the centre of each of the four fronts of the building a staircase leads direct to each floor of the building, and another

marble. The walls are lined with polished Hepton Wood stone—a Derbyshire stone—relieved by columns of Irish marble. Between these columns are arches containing important groups of sculpture, representing the various virtues naturally attributed to the councillors of the city. The vestibule ceiling is handsomely enriched.

Passing through the vestibule into the Central Hall, the grand staircase comes into view. The central hall is pure Architecture. There is nothing in it that is not stone, with the solitary exception of the electrolier, and this is a piece of fine brass work of unique design. The hall is 40ft. square, and, like the vestibule, is paved with white Sicilian marble. A marble staircase 10ft. wide, carried on arches supported by marble columns, leads to the reception rooms on the first floor. The walls of the hall are lined, and the balustrade is constructed with a variety of most beautifully-veined and coloured marbles. Then, in alternate courses up the walls, are the soft

ceiling is left plain for future treatment. On the left of the staircase as one ascends there is a fine marble doorway leading into an ante-room to the Council Chamber. Adjoining the ante-room is a cloakroom, with oak fittings, and an oak cabinet containing sixty-six lockers to be appropriated by the members of the Council. The Council Chamber itself competes very keenly with the Mayor's reception rooms for the honour of being considered the finest room in the building. Its loftiness alone gives it dignity. The dimensions of the chamber are 60ft. by 40ft., by 28ft. high. The ceiling in its ornamentation is most elaborate. On three of its four sides the chamber is lighted by large traceried windows. The walls are panelled in oak to the height of 10ft., and above the oak they are lined with stone. The wood used in the flooring, the aldermanic bench, and the public gallery (which is provided with a separate entrance from Cheney Row) is Baltic oak, which was cut four years before being used. The grand oak canopy

behind the Mayor's chair is supported by four Ionic columns. In the centre of the canopy appear the city arms finely carved, and upon the canopy are also carved the conventional rose, shamrock, and thistle of the three nationalities of the United Kingdom. The carved panels continue along the whole front of the aldermanic bench, the subjects being chiefly floral, with here and there a mask peeping out. The councillors' seats are arranged in the form of three semicircles facing the Mayor; and though each councillor has a chair to himself he has to give elbow-room to a colleague at his desk. Between the councillors and the aldermanic bench are placed one large table for the Town Clerk and his assistants, and two smaller tables, one on each side, for the accommodation of the Press.

The Mayor's reception rooms consist of a suite of three apartments, namely, the Mayor's

moulded in plaster. The chimney-piece stands upon four fine pillars of green Irish marble, above which is a pediment with circular corners, having in its centre a carved alabaster design representing Wisdom and Valour guarding the gates of the city. There are two human figures, with buildings, in the background. In the other reception rooms the salient decorative feature is the carving of the oaken wainscots, doors, and niches. The doors are flanked by fluted columns of oak, with richly ornamented capitals. At intervals along the sides of the rooms are recesses or niches with shallow arches—all in oak—and on the panels above each recess is carved the monogram of a former Mayor of Sheffield, and the date of his term of office. At the tower end of the banquetting hall is a finely carved oaken gallery resting upon cantilevers, and

their fittings differ, but all are in the same material—unpolished oak—and the general appearance is that of simplicity and utility.

There is testimony of the Architect himself as to the ability displayed in the sculptural decoration of the building by his colleague, Mr. F. W. Pomeroy. Most of Mr. Pomeroy's work has the merit of possessing a local meaning; the finest piece of carving in the building, contained on a series of panels on the east side of the grand hall, is a representation of the local legend of "The Dragon of Wantley." Of the outside work, again, probably the best is to be found in the figures of Thor and Vulcan over the principal entrance—these allegorical personages being, of course, those represented on the city arms. One thing that had necessarily to be borne in mind regarding exterior adornment was the inevit-

SHEFFIELD TOWN HALL. SCULPTURE IN VESTIBULE. BY F. W. POMEROY.

FROM A PHOTOGRAPH BY BEDFORD LEMERE AND CO.

Parlour, the dining room, and the reception room. They may be used as separate rooms, or the whole thrown into one large hall for great assemblies by raising the partition screens, which slide into the roof. In style somewhat severe and classical, the effect of this suite upon the spectator is imposing. The rooms are floored and wainscotted with oak, the wainscoting, which extends 8ft. above the floor, being relieved at equal distances with carved niches, supported on fluted columns richly carved on the upper portions, and of the same material. The ceiling of fibrous plaster is ornamented with diamond-shaped figures. There are pairs of fluted columns on either side of the screens, surrounded with carved friezes. When the partitions are raised there is a splendid suite 155ft. long, 35ft. wide, and 22ft. high. In the Mayor's Parlour the principal decorative feature is the large chimney-piece, which rises from the floor right up to the ceiling, and terminates in the city arms

reached by a staircase in the tower. Under the gallery is the entrance to the serving room, which is in the tower, and communicates by means of lifts with the kitchens on the floor above. At the same end of the room there is a door opening towards a small open gallery that will prove useful on social occasions. This fine suite of rooms is capable of receiving and accommodating in comfort 500 guests.

From the grandeur of the reception rooms we pass to the committee rooms. There are three principal committee rooms *en suite*, and three sub-committee rooms located on the first floor, but in different parts of the building. The walls are dadoed in oak, and the floors, tables, and chairs are also of oak—the latter upholstered in red morocco leather, with the city arms emblazoned in gold thereupon. There are scores of offices on every floor, and a uniform style of treatment has been adopted with regard to them. Their purposes and

able obliterating effect of the Sheffield atmosphere upon greatly detailed architectural enrichments. The sculptor's aim in all his work has been to use some symbolism which, although it may not be understood by the man in the street, will always have interest for those who desire to be interested. Passing under the arch into the grand hall, and turning to the east, the sculptor has carved the series of panels in low relief containing the legend of "The Dragon of Wharncliffe," or Wantley. This was a terrible monster that delighted in making a meal of fair maidens, and created havoc until it came to an ignominious end at the hand of Sir Thomas More. The valiant knight is depicted in the act of despatching the dragon with his trusty sword after breaking a spear in the monster's shoulder. The children in the meshes of the tangled wood have been lured there by the blandishments of false promises. At the top of the staircase may be seen, carved in stone over the

door leading towards the Council Chamber, a mystical figure holding a scroll which advises the councillors as they pass in to be "as wise as serpents, and harmless as doves." Among other features the more noteworthy are a series of panels running round the hall under the ceiling cove, which contain trophies of arms, implements, and other manufactures of Sheffield; and on the exterior of the building in Norfolk Street, two fine figures of Peace and War, and several other interesting pieces of sculpture. The entrance in Surrey Street is surmounted by the city arms, while the vestibule inside is decorated with carvings representing the signs of the zodiac. The principal feature in the front towards Cheney Row is the large gable of the Council Chamber, with its flanking turret and traceried windows. In the apex of this gable is a statue of Justice. Scattered here and there about the building are various coats of arms belonging to gentlemen or companies connected with Sheffield, and in a panel upon the Surrey Street staircase is carved a memento of the visit of the Duke and Duchess of York in 1895. Heads of various animals, typical of our Colonial Empire, are carved above the first floor windows in the Surrey Street front.

The tower, rising 200ft. from the pavement, is built on a bed of concrete 30ft. square and 25ft. thick; the concrete itself resting on the solid rock. At the ground floor level the walls are about 5ft. thick, and advantage of this has been taken to locate within them the strong room of the City Accountant. The dome and spire at the top of the tower are covered with copper. The clock in the tower, the work of Messrs. Wm. Potts and Sons, of Leeds, is constructed to strike the quarters and hours on heavy bells.

The heating of the building is carried out on the system of low pressure steam, which is provided by three boilers in the basement. The apparatus has been put in by Messrs. Longden and Company, of the Phoenix Foundry. The heat is spread by the principle of direct radiation by means of Messrs. Longden's "Sunbeam" radiators. The lighting throughout is by electricity, and there are no fewer than 1348 incandescent lamps ranging from 16 to 50-candle power each.

Ten tenders for the building were sent in, and that of Mr. Edmund Gabbutt, of Liverpool, for £83,945 was selected.

MR. GREATOREX, the Borough Surveyor, has prepared a special report for the Sewerage Committee of the West Bromwich Town Council on the treatment of sewage at Friar Park. He submits for their consideration two schemes—the first being chemical precipitation in land and artificial filtration, and the second bacteriological treatment.

THE Waterloo-with-Seaforth District Council has approved the proposal to construct a marine promenade at an estimated cost of £16,152, and has decided to take steps to obtain the consent of the frontagers to the scheme.

A BREWERY of larger dimensions and capacity than any to be found at the present time in the neighbourhood is about to be built by Messrs. Polkinghorne and Company, on the Ashford Estate, Mutley. The contract for the work has been secured by Messrs. G. Shellabear and Son.

PLANS of the new Church of St. Martin, Roath, the proposed memorial to Bishop Smythies, have been prepared. The building will accommodate 1000, and the estimated cost is within £10,000. The subscriptions and promises amount to less than £2000.

WE have received the May number of the Journal of the Royal Institute of British Architects. It contains the official report of Mr. F. C. Penrose's paper on "The Parthenon and the Earthquake of 1894," with illustrations, a letter by Mr. E. Cozens-Smith on "Architects and Reinstatement of Buildings after Fire," memoirs of the late Charles Alfred Chastel de Boinville and the late Arthur Baker, a series of reviews on various subjects contributed by Mr. W. M. Flinders Petrie, Mr. A. E. Street, Mr. A. N. Wilson, and Mr. John Leaning, and other items.

### THE BLACKWALL TUNNEL.

THE Blackwall tunnel is just finished, and the opening ceremony took place on Saturday. For a century the need of some means of direct communication between Greenwich and Blackwall has been greatly felt, and this want became acute in the last decade. A bridge was quite out of the question; so the tunnel was dug. A population estimated at one million four hundred thousand is affected by this improvement. The contract for the construction of the tunnel was given to Messrs. Pearson and Son for £871,000. Over and above this cost of making the tunnel, the County Council has spent £344,000 in acquiring property to enable the tunnel to be constructed, and £50,000 in making the approach roads from Lower Woolwich, bringing up the initial cost of the work to more than a million and a quarter pounds. The line of the boring runs across Greenwich Marshes, and the length of the tunnel proper is 6200ft.—about one mile and a quarter—and its diameter 27ft. This admits of a carriage way 16ft. wide, with footpaths a little over 3ft. wide on each side. The tunnel is level under the river, and is fed by approaches of a degree of incline much like that of the Haymarket. The walls are lined with white glazed tiles, and the whole length underground is to be lighted with electricity, there being three rows of lamps. The tunnel is joined by iron segments, each of about a ton weight, which were placed in position by means of arms attached to the boring shield worked by hydraulic power. This boring shield is

#### ONE OF THE ENGINEERING WONDERS OF THE AGE.

In the first place it is the largest ever made, measuring 19ft. 6in. in length, weighing 250 tons, and costing to build £10,000. Its special features were designed by Mr. Muir, the engineer for Messrs. Pearson and Son. The outer shell consists of four  $\frac{1}{2}$ in. steel plates. There are two vertical plate diaphragms at right angles to the axis of the shield, dividing it into two, and these diaphragms are air-tight, and consequently at the working face of the shield. The portion of the shield that lies against the ground to be cut consists of the outer skin fixed by circular grinders to an inner skin, the two joining to form a cutting outer edge. This cutting edge consists of four floors containing twelve working compartments, and at 6ft. 6in. back from the cutting edge there is a vertical iron screen, at the back of which was a safety chamber in case of any sudden inrush of water. The great shield was pushed forward by means of jacks worked by hydraulic pressure equal to five thousand tons. This majestic mighty mechanical mole, by its use

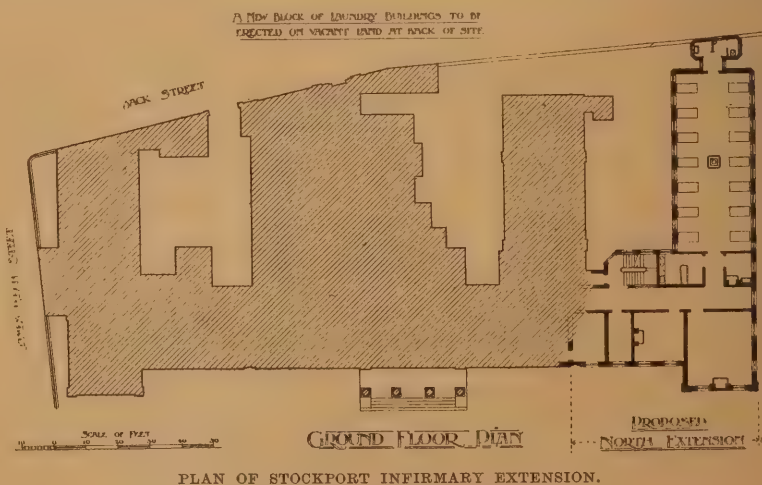

the line of the least resistance, the air bubbled up out of the depths sometimes as much as a quarter of a mile from where, buried in

#### THE SLIME OF CENTURIES,

the huge machine ground its horny head round and round, eating its way to the far shore. The bargeman, resting on the heavy oar of his lazy craft, was many a time startled, if anything ever startled a Thames waterman, at seeing a sudden upheaval of the waters as though a furnace below had made the river to boil. At times the shield approached within 5ft. of the lower waters, and then very often the air was enabled to escape in such quantities as to make it necessary that barges loaded with clay be anchored over the spot, and the cargo dumped into the river to form a proper resistance. To the tunnel there are four ventilating shafts, varying in depth from 75ft. to 100ft. These caissons are of wrought iron, and consist of two skins, the space between, 5ft., being filled with cement. They each weigh about 6000 tons. In grinding and scraping its way under the river the shields came upon a number of curiosities, all of which have been added to the museum. The most interesting and important was a mammoth's tusk, which came out in a good state of preservation; and besides there were finds of lignum-vitæ and stones a hundred feet below the river, showing that the ancient bed of the Thames was so much lower. Various strata of "Woolwich beds" were passed through, some of them so extremely tough as to bend the edge of the shield. But, taking it all in all, the finds were scarcely so numerous as might be expected. In its superintendence of this work of laying out a pleasant stroll under the Thames, the County Council took minute and particular care for the safety and health of the workmen employed. So successful has been this undertaking at Blackwall that already the details of other tunnels under the Thames are being discussed, and it is now almost certain that another huge boring will be begun at Rotherhithe as soon as Parliament can be got to sanction the work.

### STOCKPORT INFIRMARY EXTENSION.

IT has been decided to make an addition to the Stockport Infirmary, in the first place by continuing the present building at the north end, so as to equalise the Architecture of the front elevation, and also by erecting another pavilion of two stories at that end similar to those already existing. These enlargements will permit of a new and ample apportioning of day and sleeping rooms for the nursing staff, and, at the same time, add

of compressed air for forcing back every drop of water that happens to be in the ground at the time being bored, is believed to be able to make a tunnel through any sort of soil, and is not far short of having the ability to construct one in the very waters of the river. The pranks played by the air it blew from its iron lungs were many and curious, for, following

some twenty beds for patients, and room for the children. Messrs. Woodhouse and Willoughby, of Manchester, have been appointed Architects for the work, and we give a perspective view and plan of the design accepted by the committee. It is probable that the expense connected with the proposed additions and alterations will amount to about £8000.

EXTENSION OF STOCKPORT INFIRMARY.

MESSRS. WOODHOUSE AND WILLOUGHBY, ARCHITECTS, STOCKPORT.

## SANITARY PLUMBERS' WORK AND SANITATION.\*

MR. S. S. HELLYER

AT THE ARCHITECTURAL ASSOCIATION.

ON one of the dog-days in July of last year, when everything was in a state of dissolution, I received a letter from the honorary secretary of this Association asking me to read a paper on "Sanitary Plumbers' Work and Sanitation," and being in a melting mood, and it being "the second time of asking," I felt bound to accept the invitation. The subject is too large and the time too short to admit of any adornment, even if I had the power; but in this I am not troubled, knowing well enough how learned you all are in the art of embellishment, and that any deficiency of mine in this respect will readily enough be made good by you. Holding the strings of his client's purse, money naturally becomes an important factor with the Architect. He ever wants to accomplish so much for so little, and somehow money does not increase in value as the years go by—the wages world makes a shrinkage in it. I should like, therefore, to comfort your minds at the outset by saying—speaking obviously apart from the increase in plumbers' wages, which applies to all the other building trades—that the sanitary plumbers' work of to-day costs but little more relatively than did

### THE INSANITARY WORK OF TWO OR THREE DECADES AGO.

The additional cost for better treatment and arrangement for better ventilation of the soil-pipes and waste-pipes is largely met by the adoption of more simple methods, by the use of cheaper traps, smaller waste-pipes and soil-pipes; also by the use of fewer cisterns and cisterns of smaller size and of a less expensive character; and, further, by the difference in the market price of materials, lead especially being much cheaper now than it was a quarter of a century ago. I will give you an instance by throwing upon the screen illustrations

showing the insanitary method of treating a valve-closet thirty to forty years ago, and the sanitary method as generally practised to-day by those proficient in the craft of plumbers' work. The excess of work is so marked in the old method that I need not go into figures to show its greater cost. No doubt the many improvements which have been made in the best kinds of valve-closets have increased their cost, but this is met by the simplification of certain parts, and by the use of plainer basins, a simple white satisfying for most places now; for we no longer require to study colours in our water-closets—we have our art schools for that—nor do we now seek for closet-basins with looking-glass bottoms. I think I ought to say that there are older methods of treating

#### THE VALVE-CLOSET

than the one just shown, that being considered (half a century ago) an improvement upon the treatment it first received in the latter part of the last century and the earlier part of this. For instance, in the illustration just shown the waste-pipe from the safe is trapped independently of the closet trap, a weeping-pipe from the closet service is turned into it for charging the trap with water every time the closet is used; whereas in the earlier method the waste-pipe from the safe was connected with the closet trap, as in fact was also the waste-pipe from the cistern. In the earliest method of all, these two latter dangers were non-existent: the closets having no safes under them no waste-pipes were required; and as the water was generally pumped up into the closet cisterns, where situated above the basements, there was no such need for cistern wastes, especially as the water, instead of overflowing the cistern could run away through the wire-pipe of the service box into the closet-basin, and through the overflow pipe of the latter into the closet trap and out into the soil-pipe. In an illustration later on we shall see how this was done. But I am departing from my subject. In the old method the Bramah closet was supplied by means of a spring-valve, a spoon or shoe-valve, or a round drop-valve soldered to a lead service-box, the latter kind being the one just shown, but such details do not in any way upset our conclusions as to the greater

amount of labour involved in the old method than in the new. That carries us a long way, for it mattered not whether a valve-closet or a pan-closet were adopted; the plumber's work was just the same in both, the service-box only being a little larger in the former case than in the latter. For good houses the best plumbers used to consider the Bramah closet the proper kind for the principal water-closets, and the pan-closet for more common use and for servants' use indoors, and sometimes also for the upper servants' use in the yard or area, though the water-closet in the latter places was generally fitted with the well-known long hopper-closet. I will say nothing about the cost of the latter, excepting to remind you that it was cheap and advertising; but I do not hesitate to say that the insanitary pan-closet, with its D-trap and other belongings, cost more than the sanitary pedestal wash-down closets of to-day. In this reference to the relative cost of the modern method of plumbers' work with that of the old, I am not, of course, taking into consideration the additional comforts and luxuries, if I may so call them—elaborate baths and luxurious lavatories. If people want sitz, spray, and shower baths, they must expect to pay for them, as they do for their motor cars and bicycles. However, I should be sorry to convey the impression that because the prices of certain materials have been reduced, and the work to certain water-closets simplified, that

### PLUMBERS' WORK NOW COSTS NEXT TO NOTHING;

for there is a very important factor yet to be considered—viz., the labour—the crux which generally baffles the best of estimators. Plumbers' wages in London are at the rate of about one-fifth more than they were a quarter of a century ago, and I should think four-fifths more than when the Queen began to reign. The men do not receive this amount of increase in their weekly wage, for they do not work so many hours now. I am saying nothing against this advance in wages. Intelligent, industrious labour should be properly paid for. The first great requisite in a house is its water supply, for, in my opinion, as I said twenty years ago, no house can be considered safe to

\* A paper read at the Architectural Association on Friday last.

live in which is supplied with unwholesome water. If it were possible to get at the actual facts it would often be found that many a case of illness, and death, arose from bad water rather than from bad drains, from water supplied in an impure state, or which had been allowed to become contaminated in its storage. Therefore, when water has to be stored great care should be taken to see that it cannot be rendered impure by its surroundings, cannot be contaminated by the effluvia from water-closets, the emanations from ventilating-pipes, soil-pipes, and drains, or from the vitiated air of bedrooms and living-rooms. One hardly expected to have required any further restrictions, but our accountant actually saw two hobbledehoy's bathing in a cistern the other day. The illustration before you faithfully represents what (I fancied from his face when he told me) amused him as much as astonished him.

#### A PROPER CISTERN-ROOM

should be provided with lights and openings to and from the external air, and the cisterns should be so arranged that they may be readily and periodically cleansed. For this latter purpose—in addition to any overflow-pipe required by the water company—a cleansing waste-pipe should be so fixed that the cistern, or cisterns, may not only be emptied, but rinsed out with clean water from the ball-valve. To prevent the possibility of such pipes becoming conductors of bad air to the cisterns, great care should be taken to see that their discharging ends are kept well away from open traps, sinks, gullies, and places where foul air could enter them. It ought to be superfluous to say this after so much that has been written on the matter, but only very recently I came upon an error of the kind we are now considering in a nobleman's mansion, the work having been done but a year or two ago. I will show it upon the screen. The cistern-waste is taken into the head of a long length of 3in. cast-iron pipe, which, at the time I saw it, was in a very foul state, receiving as it did, the discharges from a general sink. That the waste-pipe from the sink would become fouled was pretty well understood by the authorities, for it was trapped rightly enough, though it was not ventilated; but neither the cistern-waste nor the overflow-pipe from the bath had any trap in them, although they delivered into the same head as the sink-waste. Of course trapping these pipes would be of no value, for there would be no water passing through them to keep the traps charged. I could add to such examples and give others of a more serious kind, we shall see some instances of how the cistern water can be contaminated later on in connection with other matters; but I must pass on to consider the important method of supplying cisterns with water. Apart from the great saving in cost by having a constant supply instead of an intermittent, enabling as it does the use of smaller rising-mains, and cisterns of a smaller size, and fewer in number, there is the great advantage of keeping the communication-pipes from the companies' mains always charged with water, and thus preventing them from becoming communication-pipes in another sense—from becoming, in fact, air tubes or passages for communicating disease germs. In the case of an intermittent supply, under favourable circumstances, directly the water is turned off from the main in the street the lower cisterns on the system would be supplied as they were drawn from by the water left in the mains; and it requires no great effort of one's imagination to conceive of

#### STREETS SUFFICIENTLY SLOPING

for such pipes to be quickly emptied, and to remain so daily for perhaps twenty hours out of the twenty-four. In such cases—the rising-mains in large houses being often of 1½in. bore, and even larger—the air, infected or otherwise, would pass at times even through such restricted passages from one part of a house to that of another; and also from one house to another under favourable circumstances. As the water subsided in the communication-pipes air would enter them through the open ball-valves, nature abhorring a vacuum. And

the air which would be thus sucked into the pipes would come, of course, from the air which surrounded the cisterns, and where such cisterns were in open contact with the air from bedrooms and water-closets, as shown on the screen, which represents a suburban house, of which there are perhaps hundreds like it, it could hardly be pure and might be dangerous. The upper cistern is practically quite open to the bedroom, for a badly fitted door would be no barrier, and the lower cistern is not only exposed to the air of the scullery, but also to the water-closet which opens into the scullery. No doubt any air currents set up through the empty main in the street and the communication-pipes to the houses would be induced by

#### THE DIFFERENCE IN THE TEMPERATURE

of the different houses, one house being often much warmer than another. Fortunately, there is a redeeming point in most things, and notwithstanding that specifications direct that rising-mains shall be laid in a manner to empty themselves, they are not often so treated, circumstances intervene, and "the best laid schemes o' mice and men gang aft a-gley"; the street main, for instance, stands higher than the point of ascension of the rising-main. But in cases where houses stand on much higher levels than the street main, no doubt such communication-pipes would empty back into the main in the street or road, and in streets or roads with a steep fall, as shown, the main with the water turned off would soon become empty. With a constant supply the main and the communication-pipes would practically remain always charged with water, and no such risk as we have been considering would be likely to take place.

#### CISTERNS WITH A CONSTANT SUPPLY

can be of much smaller size than when the supply is intermittent; and generally one cistern in such cases suffices for a house with a fair-sized family. The size, of course, must depend upon circumstances. It should be equal to the keeping of all the services from it going at one time, or the service-pipe to it must be of a bore sufficiently large to supply the water at about the same speed that it can be drawn from the cistern. Where there is only one cistern in a house, and it is also made to supply the hot-water circulation, the cold-water services from it for all other purposes should be so connected that a body of water is always retained in the cistern to keep the hot-water system going, in case the water should be turned off from the main for a little while; especially should this be the case when the hot-water circulation is on the tank system. Also, with a constant supply there is the further advantage of being able to draw directly from the company's main, and the water supplied to the table in this way will be found to be much cooler and nicer in every way, provided that the water in the company's main is pure and wholesome. For this purpose ½in. lead pipe will be found to be quite large enough.

#### WHEN THE WATER IS SOFT,

and would be likely to act on lead, block-tin or tin-lined lead pipe should be used, or tin-lined wrought-iron pipe, if the water company will allow it. Where the water would act on lead it would also act on galvanised iron, therefore the storage cisterns in such cases should be of cast iron or wrought iron lime-whited inside, and the cisterns for storing water for dietetic purposes would be nicer in earthenware, white enamelled inside. Great care is required in selecting the course for the service-pipe—the communication-pipe from the company's main. The pipe should never be laid under or near a soil drain, or in any trench in which bad or surface water could collect; for even though there may never be any restriction in the pipe to allow water surrounding it to be sucked into it, in case of any hole or defect in the pipe such water may find its way into it when the water is turned off from the main, and be forced up into the cisterns when the water is turned on again. Where such pipes cannot be kept at least 2ft. under ground, then, in positions where they

would be liable to very severe frost, they should be laid in a trough or box made of creosoted wood filled up to the top edges of the sides with hot pitch, with which might be mixed a little Stockholm tar and some sharp sand. No lead or iron pipe should be allowed to come

#### IN CONTACT WITH LIME,

and when such pipes pass through clay soil they should be well tarred over or be embedded in ashes or cocoanut fibre, which will also be helpful in protecting them from frost. If plumbers' work inside our houses ended here we should not have much to fear from noxious gases in our homes, but civilisation calls for certain conveniences to be placed indoors, and I must confess that it is most comforting to one's mind, if feeling a little "out of sorts" on going to bed, to know that if taken ill one will not have to light a lantern as in the olden times and go out into the night air. Now I know of no reason beyond that of incapacity why a water-closet should not be fixed inside a house with absolute safety, safer and sweeter, in fact, than a night-stool in one's bedroom, the use of which, when all the servants are in bed, would leave its presence painfully present for the rest of the night. But it is not so much a question of a night-stool *versus* a water-closet, or a privy or water-closet situated out of doors *versus* a water-closet indoors; for the outside convenience, by bad arrangement, may render it and the air surrounding the house

#### MORE UNHEALTHY

than even an insanitary water-closet indoors. The important question is: Can a water-closet be so fitted up that it may be used with absolute safety in any position or place it may reasonably be required, either outside or inside a house? Personally speaking, if I could not answer that question in the affirmative, I should not be here to-night. Living on an island, we naturally believe in isolation. We isolate all clean water-pipes, such as safe-wastes, cistern-wastes, and overflow-pipes, by making them discharge into the open air. We also isolate all dirty water waste-pipes, such as bath-wastes, sink-wastes, and lavatory-wastes, by exposing their discharging ends to the air outside the house, and in this matter we stand ahead of all other nations, not excepting even America. In some cases we also isolate soil-pipes, by "disconnecting" them from old and filthy soil-drains, safeguarding them from the air in the drain, and giving to each soil-pipe a separate inlet and outlet for

#### CONTINUOUS VENTILATION.

We go further than this, for we not only isolate the drain of one house from that of another, by disconnecting both from the common sewer, but in some cases we disconnect one section or wing of a building from that of another, excluding any infected air which may be in one section from another, and providing independent ventilation to each section, taking care, however, that no length of drain shall remain unventilated. And we not only isolate the main carriers, the sanitary wings are now isolated from the general building. And the water-closet apartments are not only isolated, but the water-closets. The "Corbel" and the "Bracket" closets have been specially introduced to isolate them from the floor as well as from the walls, an illustration of which is now before you. But isolation is not everything, our ships of war still count for something. A water-closet may be as isolated as a sentry-box, and yet be dangerous, for in this sanitary age no water-closet can be pronounced sanitary in the highest degree which cannot be used and left in itself and in all its parts as clean and wholesome as it was before usage. To compare various points and features of the great variety of water-closets and flushing-cisterns which now exist would require several evenings, and to attempt this to-night would only tend to the confusion of our minds on a subject simple enough in itself, but which, owing to the multifarious patterns of the many manufacturers, has become a little complicated.

(To be continued.)

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
May 26th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ON the first page of this issue we give an illustration of the service of gold altar-plate which has been accepted by the authorities of St. Paul's Cathedral in commemoration of the sixtieth anniversary of the accession of Queen Victoria, and which will be formally presented to them on June 20. The set, the pieces of which have been designed and manufactured by the Goldsmiths' and Silversmiths' Company, consists of four chalices, two flagons, and four patens, and all the gold used in the making of the service is of 18-carat. The ornamentation of the chalices consists of cherubs of the orthodox type, intermingled with vines and foliage in the style of some of the internal decorations of the metropolitan Cathedral. Very ornate is the relief work executed on the base and stem of the Communion cups, which are Italian in shape, with curved lips, and partly burnished. The patens are without ornamentation, but on the reverse side of each one is the sacred monogram encircled by the crown of thorns. The crosses on the lids of the flagons were modelled after that which surmounts the dome of St. Paul's. The gift is from Mr. Hooley. We understand the work has been done by two English goldsmiths, and no doubt from a point of workmanship leaves nothing to be desired.

As there were no "Old Masters" at the Royal Academy last winter, such an exhibition as that which is now open at Messrs. P. and D. Colnaghi's, in Pall Mall East, is all the more welcome. It is small, but good; a distinct advance upon its predecessor of last year. It consists of thirty-two Dutch and English pictures, including three beautiful sketches by Rubens, who, of course, is not strictly admissible among Dutch masters. Of these last the most important is a fine portrait of the Artist's father, by Rembrandt, signed and dated 1631; one of the not infrequent additions that eager search is making to Dr. Bede's list. It is flanked by two excellent little "laughing boys," by F. Hals, full of the master's characteristic energy, humour, and virtuosity. Two interesting equestrian groups (evidently portraits) by T. de Keyser, of which one is signed, are fine specimens of the later manner of this rare master; and a portrait by A. de Gelder, the latest of Rembrandt's pupils, comes very near to his great teacher. The English pictures include three fine half-lengths, the "Madame Le Brun" (the singer) by Gainsborough, the "Miss Clements" by Sir T. Lawrence, and the "Mrs. Fletcher" by F. Cotes, all as good as they can be in their different ways; and there is also the delicious "head of Gainsborough Dupont," the last work of his illustrious uncle. A charming head by Hoppner, a good small Bonington, Romney's "Mrs. Willett," and the admirable Crome from the James Price sale, are also included in this well chosen group of pictures.

IN all the City thoroughfares along which the Jubilee procession will pass active preparations for the decoration and illumination

of the streets and houses are now being made. Especially is this the case in Cornhill, Cheapside, and Mansion House Street. The arrangements at the Bank of England promise to be of a very elaborate character. The roof of the Bank will be conspicuous by the display of an emblematical group of figures, below which will appear in coloured lights the motto "She wrought her people lasting good." Messrs. Pain and Sons, St. Mary Axe, have, we believe, been entrusted with the decoration of London Bridge, the Monument, and Temple Bar. The decoration of the "Griffin" will be confined to a floral display, as there is a general consensus of opinion that canopies, triumphal arches, and all street erections of an elaborate character will be out of place, so strong is the desire of all concerned that nothing shall be allowed to interfere with the view of the pageant. The Royal Exchange will have its massive columns treated in coloured lamps, while the whole outline will be picked out in white and red lamps. The treatment of the Mansion House will probably be somewhat similar in style, though the illumination will be in greater detail. The contract for the decoration of Cheapside as far as the Mansion House will probably be placed with Messrs. Piggott Brothers, of Bishopsgate.

Nor only the disciples of Turner, but every lover of beauty, will greet with delight the completion of the peerless Liber Studiorum, which the master was obliged, from lack of funds, to leave unfinished. The issue of the engravings hitherto unpublished fittingly signalises the close of the nineteenth century. Mr. Frank Short, in undertaking the reproduction of sixteen important plates, has proved that his work can fairly stand beside that of the earlier engravers, whose proofs were under the Artist's supervision. His appreciative rendering of the spirit and magic harmony of Turner's pictures is the more remarkable from the slightness of the original drawings. The engravings, which are all mezzotint, are on view at the Rembrandt Gallery, 5, Vigo Street.

LECTURING on "Building Contracts" at Bristol in connection with the Master Builders' Association, Mr. F. E. Weatherly, barrister-at-law, pointed out peculiarities which distinguished building contracts from ordinary contracts. The Architect, he said, was valuer, judge, and master of the situation. Moreover, he was agent of only one party of the contract, and his decisions and valuations could not be attacked except for fraud. To counteract this enormous power of the Architect, clauses were inserted in the building contracts limiting the power, and giving in cases of certain disputes the right to refer to arbitration. In Bristol and the West all things no doubt worked smoothly between the Architect and builder, but the powers given to Architects by the common forms of building contracts were precisely what might cause friction—even ruin to builders and disaster to employers in cases where an Architect was young and inexperienced. The Architect did not guarantee that his drawings were correct, that his plans were feasible, that his calculations were accurate. He could not bind his principal by verbal representations varying his contract. The builder had no remedy where an Architect made an error in favour of employers, but where it was in favour of the builder the employer had a remedy against the Architect. The builder was absolutely at the mercy of the Architect unless he could show fraud, which was very properly a terribly difficult charge to support. One point builders had to fight for was that the drawings and plans should be guaranteed by the Architect or his employer. He understood that the Builders' Association had drawn up arbitration clauses which they desired to have adopted, but these had not been accepted by the Institute of Architects.

MANY are the uses—and abuses—of advertising, and those interested in either should visit an exhibition of posters opened last week at St. Bride's Institute, Fleet Street. The exhibition is under the direction of Messrs. Hore and Co., and embraces a wide collection of original designs for posters by Mr. Louis J.

Rhead. Mr. Rhead's skill and taste are essentially decorative, and the esteem in which his work is held in America must be greatly fostered in this country, too, by such an exhibition as that under notice. Massing and balance of colour, the well-defined lines, and other technical virtues that should appertain to that branch of pictorial expression for advertising purposes, are most happily combined in the work of Mr. Rhead, who is equally effective with the most brilliant of positive colours as with quieter tertiaries. A design for a musical magazine suggests a symphony, in its fine scheme of yellows against a green background. Another poster for the Gentleman's Magazine has the central figures robed in red amidst floral surroundings, and their sisters in blue; "Modern Light" is contrasted with an almost poetical "ancient flicker"; "Old Irish Whisky" is green with shamrocks and accompanying emerald tints; a design proposed to advertise flower seeds is really imaginatively conceived; while for the "Seven Ages of Smoking" a row of heads commences with the Indian, and from Raleigh, and the comfortable visage of an old Dutchman, reaches, shall we say, the decadence of the science, in the modern "masher."

A NUMBER of workmen engaged in making excavations in connection with the building operations near to Belfield House, Musselburgh, have unearthed two stone coffins, about 6ft. from the surface, containing human remains. The cists, which were of rude and primitive workmanship, were of angular shape, and measured about 3ft. in length and about 18in. at greatest breadth, and 2ft. deep. The peculiar shape of the coffins is accounted for by the remains having been placed in a sitting posture, in which they were found. The remains were in a remarkably good state of preservation. Sir William Turner, Anatomy Professor in Edinburgh University, believes they are those of Romans, and have lain in the earth for over 1800 years. In December last no less than five coffins containing remains were unearthed at the same spot, which is now believed to have been a Roman place of sepulture.

THE progress of the restoration of the grand Church of St. Bartholomew the Great reached a most important stage last week, when the restored Lady Chapel was reopened and dedicated. In few of the great historical Churches of the land had desolation wrought such havoc as in this, unquestionably the most interesting, after the Abbey, in all London, and but little behind any that could be named in the three kingdoms. Since 1863, the tide of pious restitution has been gradually and steadily filling up the waste places of profanity and vandalism, and now, though the nave has gone beyond hope, the stately choir, something of the transepts, and at last the Lady Chapel have been brought back to a state which is both religiously and Architecturally becoming. Like the grand Norman Church at Shoreham, like the beautiful Abbey Church at Pershore, like scores of the profaned and despoiled fanes that were butchered to make a courtier's holiday in the remarkable secular era of the sixteenth century, St. Bartholomew's Church only begins now at what was originally the entrance to the choir from the vanished nave. But forge and fringe factory have also disappeared for ever, and the massive and imposing remains of Rahere's grand Church no longer do dishonour to the memory of the pious founder, nor to the loyalty of English Churchmen. Between 1863 and 1866 the good work was inaugurated by the lowering of the floor to its original level, the removal of the pews and the completion of the apse on the ground floor level, the story above being occupied by the famous fringe factory. In 1884, the fringe factory, which projected 20ft. into the east end of the Church, covering the remains of crypt and Lady Chapel, was purchased for £6500, the apse was restored, the Church re-roofed, and the blacksmith's forge purchased. The present rector, the Rev. Sir Borradaile Savory, Bart., succeeded in 1887, and has vigorously carried on the work of his

predecessors. Under his auspices good work has been done with the south transept, the boys' school has been removed from the north triforium, and new schools built adjoining the Church; the north transept has been recovered from the blacksmith and turned into a small morning chapel, porches have been built, the triforia opened out, the crypt restored and adapted for a mortuary chapel, and lastly, after many minor but important details of restoration, the Lady Chapel has been restored, after more than 350 years of secularisation. The whole of the restoration has been carried out under the able superintendence of Mr. Aston Webb.

ONE class of painters can have, this season at all events, no cause to grumble. Not within living memory have London decorators been so busy. Other trades will have their turn by-and-by. The house-painters have been the first to reap the Jubilee harvest. Everything has to be finished before May is over. It is depressing to think that of all the thousands that will be thus spent there will be scarcely any permanent advantage to the appearance of London. The house-painting, of course, is good so long as it lasts. We know how transitory is that splendour. For the rest, the work in its result will be literally ephemeral. It is a kind of relief, however, to note that for the occasion the Marble Arch has been thoroughly cleaned. The familiar gateway just now almost looks like marble. One permanent improvement to an important bit of London thoroughfare will henceforth date with the Diamond Jubilee.

DR. DAVID MURRAY, President of the Archaeological Society of Glasgow, has issued his address to the society in the form of a pamphlet, pleading for an archaeological survey of the United Kingdom. Government spends large sums on the preservation and protection of records, or the reproduction of charters, but neglects the monuments which illustrate or supplement these records. For the interpretation of our Runic monuments we have to thank a Dane, Professor Stephens, of Copenhagen; for a record of our Roman inscriptions we have to look to Germany or Canada. Artistic objects are cared for by the Science and Art Department, but other objects, such as Roman altars, are passed by. The provisions of the Ancient Monuments Act have not been applied as they ought, in Dr. Murray's opinion, the Government having declined to accept many monuments which it was desired to bring under the operation of the Act.

AN equestrian statue of Maria Theresa, the famous ancestress of the House of Habsburg-Lorraine, was recently unveiled in Presburg on the Danube, the old Hungarian coronation city, in the presence of the Emperor and almost all the members of the Imperial house. The monument shows the energetic Empress in the coronation robes, with the Imperial crown on her head, mounted upon a fiery steed, and attended by a Hungarian magnate in his national dress, and by a warrior of the Hungarian insurrection. The monument is intended as a historical reminiscence of the memorable Reichstag of 1741, in which the young Empress fled from her enemies to the Hungarians, and with her firstborn in her arms—he who became the popular Joseph II.—appealed to them so successfully that the members of the Reichstag spontaneously drew their swords, and burst into the enthusiastic cry: "Vitam et sanguinem demus! Moriamur pro rege nostro Maria Theresia!" A young Hungarian sculptor—Fadrusz—as yet unknown to fame, is the author of the monument, which is entirely of white marble, and has been placed upon the Coronation Hill upon which the Kings of Hungary pointed their swords in the four directions of the compass, and vowed to protect the kingdom against all enemies.

Nor many people are aware of the existence of the Russell Institution, in Great Coram Street, and yet it possesses literary and artistic treasures of no small value. The ground lease expires this year, and the contents of the building are to be sold.

Among them is Haydon's vast canvas, "Xenophon's First View of the Sea, in the Retreat of the Ten Thousand." There is a peculiar history attaching to this work of the ill-fated painter. It was won by the seventh Duke of Bedford in a raffle during 1836. In that year it was valued, unframed, at 800 guineas, and the lottery consisted of eighty shares at ten guineas each. Among the participators were, it is stated, William IV., the Duchess of Kent, her Majesty the Queen (then Princess Victoria), the Duke of Sutherland, the first Lord Durham, familiarly known in the north as "Radical Jack," on account of his advanced opinions; and Lord Francis Egerton. The Duke of Bedford, who had three shares, won the picture and presented it to the Russell Institution, which was at that time a prominent feature of his Bloomsbury estate. The picture is 11ft. 6in. long and 9ft. 6in. high. It was exhibited, among other canvases by Haydon, at the Egyptian Hall in 1832.

DREUX, where the mortal remains of the Duc d'Aumale were laid to rest, was first used as a place of sepulture for the d'Orléans family by the Duc de Penthièvre at the close of the last century. During the Revolution the mausoleum was razed to the ground, and the remains of those interred in it scattered to the winds. A mortuary chapel in neo-Grecian style was erected on its site by the Duchesse d'Orléans, the wife of the Duc de Penthièvre, on her return from exile. This chapel was enlarged by Louis Philippe. The majority of the numerous tombs the building now contains are of great beauty. The Architecture, as might be expected from the period, affords a confused but not offensive medley of Gothic, Byzantine, and Lombard styles. Statues of saints adorn the porch, which is flanked by two slender towers, and an angel of the Resurrection guards the sanctuary. The dome, topped by a cross, corresponds to the circular shape of the interior, which is broken by two side chapels and an apse behind the high altar. Eighteen oak stalls, in double row, enclose the limited central space, and light is admitted through good modern stained glass, from designs by Ingres.

At a meeting of the Society of Arts, held last week at the Institution in John Street, Adelphi, a paper was read by Dr. Percy Frankland on "The London Water Supply." The lecturer pointed out that, although the conditions of supply were much as they were when he discoursed on the subject in 1884, science had moved onwards, and the discoveries in bacteriology had opened up new fields of investigation. It was now recognised that, at any rate, typhoid fever and Asiatic cholera might be communicated by water, and various questions in connection therewith had to be considered. The results of his investigations led him to conclude that the processes of storage and filtration, as practised on the London supply, constituted two very powerful bacterial barriers which were interposed between the rivers on the one hand and the service mains on the other. Owing to these barriers it must obviously be very improbable that any particular micro-organism, whether harmful or harmless, present in the original river-water, should reach the water consumer. Of late years an enormous amount of new and important information touching the hygiene of water had been collected. This new knowledge had wrought a great change in expert opinion throughout the world, and this change of opinion had been greatest in respect of precisely that type of water which constituted the major part of the present metropolitan supply, viz., river water which has been subjected to storage and filtration. Bacteriological investigation had shown that river waters by suitable storage and filtration could be rendered of excellent quality for the supply of towns, and that the extent to which such surface waters could be deprived by means of these processes of their bacterial life was altogether beyond what was to be expected. Careful search had also revealed the mechanism by means of which this remarkable purification was effected; it had shown what dangers this mechanism was exposed to, how these dangers

might be guarded against, and how the efficiency of the mechanism might be maintained and even improved. Bacteriology has thus become of priceless value to the water engineer.

THE Princess of Wales is exhibiting, at the annual show of the Home Arts and Industries Association, at the Royal Albert Hall, a piece of furniture of very novel design, which can be used as bookshelves or a rack. The beautiful embossed and gilded Cordova leather work which covers each end is her own handicraft, and harmonises admirably with the iridescent golden green with which it is enamelled. Princess Victoria has sent a quaint little stool, of which she has worked the cover in a dainty incised design of birds, cherries, and foliage upon leather, and signed "Victoria, '97." From the Duchess of York comes a heart-shaped occasional table, with the top ornamented by herself in poker-work in a curious but decorative device of grotesque birds and dragons, intertwined with ribbons. With these exceptions, however, the Alexandra School at Sandringham, whose exhibits are always one of the chief attractions of the exhibition, is unrepresented this year, on account of the serious illness of Fraulein Nödel, the accomplished directress.

At the concluding meeting of the Edinburgh Association of Science and Art for the session, held in the Scottish National Portrait Gallery, the President, Mr. George Somerville, read a paper on "Improvements in the Manufacture of Iron and Steel during the Reign of Queen Victoria." Mr. Somerville, in introducing the subject, referred to J. B. Neilson's invention of the hot blast, and the great economy in fuel for melting crude iron, to the demand for a heavy class of forgings caused by the development of railways and ocean steamships, to Nasmyth's invention and application of steam hammer, to Armstrong's successful manufacture of big guns up to 100 tons, to Bessemer's new steel process, followed by Siemens-Martin manufacturing mild steel, and the latest process of manufacturing nickel steel, which had a breaking strain of 50 compared with iron, which was only 20 tons per square inch. A full description was given of the various processes, the visit of the members of the Association to Messrs. Beardmore's Parkhead forge was referred to, where the Siemens-Martin process was seen producing plates and heavy shafts—notably a 70-ton steel forging ready for turning—also a more recent visit to Messrs. Denny's, Dumbarton, where the party saw the plates being used for shipbuilding, and heavy boilers, 1½ in. thick, to stand a pressure of 200lb. per square inch, being four times the thickness and able to bear twenty-five times the pressure of those in operation at the beginning of the Victorian era.

THE Society of Miniature Painters, while declining competition with the exhibition of famous portraits in New Bond Street, affords an appropriate opportunity of actually comparing the work of the present day with the standard of the old masters. Its second exhibition, at Messrs. Graves's gallery in Pall Mall, indicates that there is still a goodly following of the Art in which English painters have always held a distinguished place. Among the exhibits several clever studies by Mr. Lee Hankey are prominent. Mr. A. Williams, the president, shows work noteworthy alike in execution and rendering of character, and Mr. Cecil Quinell has some remarkably fine portraits. The contributions of many other members also repay careful study.

ENGINEER VOSS, of the shipbuilding firm of Blohm and Voss, in Hamburg, Germany, has completed plans for a giant ocean greyhound that is intended (he says) to cross from Southampton to New York in sixteen hours, which means a speed of 190 miles per hour. The inventor bases his calculations on a multiplicity of screws. The greatest number of screws now employed in shipbuilding is three. Voss means to use ten screws, and whereas the existing three-screw steamers carry their

propellers aft, set in the form of a triangle, with the middle screw a little lower than the others, the Hamburg inventor proposes to furnish both sides of his ship with five screws each, distributed at regular intervals from bow to stern. By this means he hopes to give the ship the greatest possible amount of stability and to prevent her from rolling. His plan presupposes that the screws will remain steadily in the water and be enabled to do their work uninterruptedly.

ALL the land required for the new University College Hospital, Gower Street, has now been secured, and the questions of light and air settled with the adjoining owners. The demolition of one-fourth of the houses on the site of part of the addition will be commenced in the course of the week. This will in no way interfere with the usual work of the hospital. Mr. Alfred Waterhouse has succeeded in rearranging the plans, so that a much finer entrance is made for the outdoor patients, this being a particular request of Sir Blundell Maple, who is anxious that sufferers, while waiting to see doctors, should be comfortably provided for.

THE Metropolitan Asylums Board, at its meeting on Saturday, resolved, subject to the approval of the Local Government Board, to purchase from the City Corporation, for the sum of £53,000, the plot of land facing the Victoria Embankment, at the corner of Carmelite Street, with frontages of 93ft. to the Embankment, and 191ft. to Carmelite Street, as a site for offices for the managers.

#### NEW THEATRE AT PLYMOUTH.

PLANS of the new theatre of varieties which is to be built near the dividing line between Plymouth and Stonehouse have now been approved of. The building is designed by Mr. William Henry Arber, of the firm of Wimperis and Arber, of 25, Sackville Street, Piccadilly. It will have a frontage of 140ft. on Union Street, and will run back with a similar length frontage in Phoenix Street. The style adopted is free Renaissance, and it is intended to be executed in chesnut terracotta. The façade is to be highly embellished with rich modelling. Taking the central bay first, the grand entrance is carried up the full height of the building—four storeys—in one composition, surmounted by a pediment containing the amalgamated arms of the Three Towns. The main portion of this gable is richly modelled, and contains two life-size historical figures, supporting a metal shield. Below this there is to be an artistic wrought-iron sign, bearing the name of the house. At the springing of the roof is

#### A FINE OVERHANGING CORNICE,

supported by carved medallions, over an enriched frieze. The three main storeys are composed of three different orders of Architecture. The vestibule and balcony are lighted by three large semi-circular arch openings. The vestibule is two storeys high, and will form a very fine feature of the design. It will contain a handsome double marble staircase, and the walls will be painted in design. The main entrance will be for the stalls and grand circle. It will contain the usual box and managerial offices. Across the full width of the building there is to be an arched portico, supported on cantilevers, so as to cause no obstruction in the street. On the right of the main entrance there is a grand hall, a portion of which will be used for flower and confectionery stalls, whilst on the left will be the entrance to the pit. The gallery entrance is to be in Phoenix Street. On either side of the grand entrance, and on the first tier, will be two large, semi-circular panels, to be filled in with Doulton vitrified frescoes, representing David Law's celebrated pictures, the sailing of the Armada, and its ultimate destruction by the fire-ships of Hawkins and Drake. The building is to be

#### FLANKED BY TWO TOWERS.

One of these is in the shape of a lighthouse beacon, in which there will be accommodated

an electric flash light, which will be visible over the Three Towns. A special feature throughout the construction is that it will be fireproof. The curtain will be of asbestos, the gallery served by three concrete stairways, and there are also to be three staircases for the grand circle, and ample emergency exits in both streets. A pass staircase for the firemen and staff may also be used as an additional emergency exit. The interior is designed with two tiers, gallery and grand circle, the sitting accommodation being estimated at 2000. The two balconies are horseshoe in form, and on both the ground and the first tier there will be eight boxes. The roof, which is also to be fireproof, will be surmounted by an elliptical dome, finely coffered. The style of decoration generally will be painted subjects and trophies, the former illustrative of naval and military progress from the days of the old galleons and armour-clad soldiers down to the present. The proscenium arch will be surmounted by a very fine panel illustrative of a sea fight. The dimensions of the proscenium are to be about 40ft. square, which is as large as that of almost any theatre in London, with the exception of Drury Lane. The stage will be 80ft. wide by 40ft. deep, and is to be fitted with all modern appliances,

#### CONSTRUCTED CHIEFLY OF IRON;

large scene dock, grid, doorways for scenery or for the admission of performing animals, the lighting and ventilation being into Phoenix Street. The top story of the building will contain a board-room or caretaker's or manager's flat, approached by a separate staircase from Phoenix Street, the high-pitch roof being utilised for the construction of painting or workrooms. The Great Western Hotel, which adjoins the site of the new theatre, is to be incorporated in the design, so that the whole façade will be made to harmonise.

THE Fine Art Society has given a commission to Mr. T. M. Henry, the painter of the wreck of the Birkenhead, to paint a picture of the wreck of the Warren Hastings.

AT Wigan it has been decided to obtain £40,000 in voluntary subscriptions for the erection and equipment of a technical school for the town and the surrounding townships, and at a meeting held early in the month nearly £10,000 was promised. At another meeting further subscriptions amounting to close upon £3400 were announced.

THE new swing bridge over the Dee at Queensferry, Hawarden, erected at a cost of £13,000, contributed by the Flintshire and Cheshire County Councils and the adjacent landowners, including Messrs. Herbert and Henry Gladstone, the trustees of the Hawarden estate, is still in the hands of the contractors, but it is expected that it will be completed in time for the formal opening on Whit Monday.

THE King of Siam performed the opening ceremony of the Khorat Railway, recently completed between Bangkok and Ayuthia. The new railway, although only a section of the Nagara Rajasima line, would be one of the most important of all the railways in the kingdom. All the railways to be constructed in the future, both to the north and east of Siam, would converge on that section as the main line common to them all.

CONTRACTS were let, at a meeting of the Leeds Waterworks Committee last week, for laying a 22in. main from the Weetwood filter beds to the Headingley pumping station, and for the laying of a 32in. main from Sheepscar along Roundhay Road to the new Harehills service reservoir. For the former work, the tender of the Staveley Coal and Iron Company was accepted, the amount being £2860. For the putting down of the Roundhay Road main, Messrs. Young and Co.'s quotation of £1338 was accepted. When this work is done, complaints of an inadequate water supply to the higher districts will, it is expected, be heard no more. It was reported to the Committee that the construction of the Eccup embankment was proceeding satisfactorily. Efforts are being made to have it completed by the date of the annual visit of the members of the Council to the waterworks in July.

#### LONDON IMPROVEMENTS.

##### THE HOUSE OF COMMONS COMMITTEE.

A SELECT Committee of the House of Commons, presided over by Mr. Rankin, has just had under consideration the London County Council (Improvements) Bill, the chief objects of which are to empower the Council to make a new river embankment, a new street, and various street improvements. The Bill, which involves the question of betterment, also provides for the widening of the Strand by the removal of Holywell Street.—Mr. Freeman, Q.C., for the promoters, explained that the Bill authorised the London County Council to make four distinct improvements, namely, extending the embankment from Battersea Bridge to the point where Lot's Road and Cremorne Road meet. This would enable Cheyne Walk, which was very narrow and had a great deal of traffic along it, to be considerably widened. The foreshore between the line of embankment and Cheyne Walk at low water was a mudbank, which the medical officer of health had frequently reported to be dangerous by reason of its insanitary condition. The Chelsea Vestry was so favourable to the scheme that it had taken the almost unprecedented course of agreeing to contribute one-fourth of the total cost. The next improvement was that for making a northern approach to the Tower Bridge. The great difficulty was that at the north of the bridge, though

#### THE STREETS WERE VERY NARROW

and congested, they were passed over by exceedingly important railway work, which he believed was now used by the Blackwall, the Great Northern, the London and North-Western, the Tilbury, and the Midland Companies. This locality could not be avoided in any scheme in this direction. The County Council, however, took the advice of the best engineers, and they were informed that the improvement could be carried out, but that it would take a long time, and that the cost would be great. The best street for carrying the traffic was one leading from the bridge, by Little Tower Hill to Great Prescott Street, whence at a subsequent date it would probably be extended, and form part of the scheme of getting to Whitechapel High Street. This street as originally laid out would have taken a large slice of the Royal Mint, which could only be done with the assent of the Office of Works, but he was glad to say that after discussion this matter had been satisfactorily arranged. As to the next improvement he said it was perfectly well known to the Committee that for a considerable number of years past a very prominent question had been the absolute necessity of obtaining a new street from Oxford Street or Holborn to the Strand, and there was a pretty general consensus of opinion that that street should pass into the Strand somewhere near Waterloo Bridge. Up to the present time enormous difficulties had intervened, partly physical and partly financial. In addition to the fact that such a scheme would involve considerable engineering work, and enormous expense connected with theatres and other large buildings, was the fact that there were very large areas of insanitary and bad property to the rear of the Strand and Wellington Street, which, before carrying out the scheme, should be first dealt with under the Artisans' Act. The present proposal, which was rather an instalment, was to sweep away the whole of the island of houses between the churches of St. Mary-le-Strand and St. Clement Danes, and between Holywell Street on the north and

#### THE STRAND ON THE SOUTH.

The present was a very fitting time to carry it out, for it so happened that most of the leases of that island of houses were now falling in. The fourth improvement was of a similar character to the last, but related to the island of houses at the corner of Tottenham Court Road and Oxford Street, known as Bozier's Court, which formed an exceedingly objectionable block to the traffic, and which could be very easily dispensed with. The road was

very narrow there, and there seemed to be no question that it would be an exceedingly desirable thing that it should be removed, the only point being who should pay for it. After discussion with the local authorities, the County Council came to the conclusion that it would be justified in effecting the improvement, and in charging it upon the metropolitan rates. Counsel proceeded to explain to the Committee the part of the Bill relating to the raising of a large proportion of the cost by what was generally known as the betterment clause, which applied to all four improvements. The general principle was very simple, and probably commended itself to everybody, viz., that if particular property of private individuals was improved by the outlay of public money, a proportion, at any rate, of the benefit so conferred upon the property should be returned to the public who had undertaken the expenditure.—Mr. A. R. Binnie, engineer to the County Council, gave evidence as to the objectionable condition of the mudbank at Chelsea, and said his estimate of the cost of the new embankment was £38,000.—Resuming the consideration of the Bill, Mr. Andrew Young, valuer to the County Council, said his estimate for acquiring the property and rights necessary to make the embankment was £26,000. He held that the present case was essentially one for the application of the betterment principle for the improvement in the value of property that had followed the making of Chelsea Embankment to the east of Battersea Bridge.—Mr. Caröe, Architect to the Ecclesiastical Commissioners, living at 94, Cheyne Walk, said from his western window there was a view which he believed was unique, and the loss of which would be

#### A SUBSTANTIAL INJURY,

not only to the neighbourhood, but to London. It was from his house that Mr. Whistler painted some of his best views of Chelsea Reach. The house that Turner died in was in Cheyne Walk, and the balcony he built for observing and painting the Reach still remained. Among the signatures to the petition against the scheme were those of Lord Ripon, Lord Lovelace, Lord Monteagle, Sir Edward Poynter, P.R.A., Sir Alfred Wills, Lady Victoria Grosvenor, Sir Walter Besant, and a number of Royal Academicians, including Mr. Briton Riviere, Mr. Waterhouse, and Mr. Aitchison.—Mr. David Murray said that the Reach should be preserved as far as possible in its present condition; it was very beautiful, and frequently formed the subject of pictures. The embankment would be an obstruction to the foreshore and quite out of keeping with the class of buildings there.—The Chairman said the Committee had visited the locality at Chelsea that morning, and had come to the unanimous conclusion that the preamble of the Bill relating to this part of the County Council scheme had not been proved.—The Committee then took into consideration the second proposal of the County Council for the making of a suitable

#### APPROACH ON THE NORTH TO THE TOWER BRIDGE

by the construction of a road 60ft. wide extending from the bridge to Great Prescott Street. This road, which would involve a portion of the site of the Royal Mint, was intended to form a convenient and wide means of communication between the bridge and Commercial Street, and to relieve the present congestion of the traffic between these two points. Great difficulty had been experienced in designing any new thoroughfare owing to the fact that it must very considerably interfere with the extensive lines, depôts, &c., of several railway companies which existed there. As a consequence there was a great deal of opposition to the present proposal, which was greater in consequence of the fact that it is proposed to raise part of the cost by the exercise of the betterment principle. The cost is estimated at £60,000 for works and £159,000 for land and property.—Mr. John Wilson, engineer to the Great Eastern Railway Company, said part of the scheme was to place a bridge of steel 60ft. wide where a brick arch 40ft. wide, belonging to the Great Eastern Company, now stood.

The bridge at this place carried eleven lines of railway, and in a working day there were some 600 trains passing in and out of Fenchurch Street Station. The traffic was greater here than at almost any other spot in the world, and he did not think the County Council realised all the difficulties of undertaking the work it proposed.—The Committee, having heard the arguments of counsel appearing for the Great Eastern, London and Blackwall, London and North-Western, Great Northern, and Central London Railway Companies, who opposed the scheme, decided to

#### APPROVE THE PREAMBLE OF THE BILL

in regard to the Tower Bridge approaches. They also found that railways, as such, were not to be exempted from the operation of the betterment clauses, except as far as their running lines—those lines which were not sidings—were concerned. Proceeding to take into consideration that part of the Bill which proposes to widen the Strand by removing the block of houses lying between the Churches of St. Mary-le-Strand and St. Clement Danes, the Committee heard the evidence of Mr. Andrew Young, valuer to the County Council, who stated that the owners of the Hotel Cecil had been so impressed with the necessity of widening the Strand that they had promoted a private Bill for that purpose at their own cost, but their proposals did not go so far as those of the County Council.—For the opponents of the Bill, Mr. A. Ventris, surveyor to the Strand Board of Works, stated that unless the whole block of houses on the north side of Holywell Street, which were of poor class, and had small frontages, came to be owned by one person or authority, there would be great difficulty in making them of the character suitable to the importance of the new street. The rateable value of the property to be removed was £10,865; of the island of houses between Holywell Street and Wych Street, £7670; and of the remainder of the betterment area, £74,087. The area of the island between Holywell and Wych Streets was 39,740 square feet, and the property to be removed 32,560 square feet. If the Strand were only widened to 80ft., which would be ample, instead of as proposed, 24,750 square feet of area, at present taken for thoroughfare, would be available to build upon.—Mr. Robert Reid, land agent and auctioneer, said, in his opinion, if this scheme were carried out there would be an enormous expenditure of public money without any corresponding advantage, because it would merely make

#### A LARGE OPEN SPACE

between the two Churches which would narrow down very considerably at each end, and the open space would thus be of little more use than the present thoroughfare. The principle of recoupment rather than of betterment should be applied in the present case. As the block of houses between Holywell Street and Wych Street must be dealt with in the near future, it would be wiser and cheaper to postpone the scheme till it could form part of a comprehensive improvement.—Mr. Robert Vigers, surveyor and land agent, said the present was not a case to which either the principle of betterment or that of recoupment should be applied. He did not think the improvement would benefit the property on the south side of the Strand, because it would cause pedestrians to walk along on the north side. It might thus even damage the southern property. He quoted several instances, including those of New Oxford Street and Queen Victoria Street, in which actual loss had resulted from street improvements. He favoured the promotion of a more comprehensive scheme, embracing the improvement of Wych Street, and obviating the waste involved in the present proposals.—Mr. Blurton, a tradesman, of Holywell Street, said he considered that if the island of houses facing his premises were removed he would be considerably injured.—Mr. Baggallay, Q.C., then addressed the Committee on behalf of the Strand District Board of Works, urging that the present proposal was not the best way, either from a physical or from a financial point

of view, of effecting the improvement which all parties agreed was necessary at this part of the Strand, and that, if they were to apply the betterment principle to this case, it would add very much to the cost hereafter of carrying out any improvements in

#### EXTENSION OF THE PRESENT PROPOSALS.

He asserted that a far better scheme could be devised by which the Strand could be widened to 80ft., which was all that was necessary, and Wych Street to 40ft., there being still left a considerable area which could be used for recoupment. As to the betterment principle, he argued that it was most undesirable that it should be applied in any Bill again until its working under the Tower Bridge Southern Approach Act had been tested and approved.—Mr. Littler, Q.C., for the Duke of Norfolk, then addressed the Committee in opposition, and Mr. Freeman, Q.C., replying for the County Council, said all parties were agreed that in any scheme for the improvement of this part of London this block of houses must go; and on its merits, apart from the question of betterment, he claimed that the present scheme was a proper and reasonable one.—The Chairman said: The Committee consider that the preamble of the Bill, so far as relates to the Strand improvement scheme, has been proved. With regard to the principle of betterment, they are also of opinion that it is not in itself unjust, but in the present scheme they consider it can only be justly and usefully applied to those properties which have a frontage upon the north side of Holywell Street. They also consider that the new street, being of great width, will require refuges in the middle of it in various places, and they also wish to call the attention of Mr. Freeman to the necessary alteration—without suggesting what it should be—of sub-clause 1 of clause 41, which is the definition of the area over which betterment should be placed.—The Committee then proceeded to consider the part of the Bill relating to the widening of Tottenham Court Road at the Oxford Street end by the removal of the island of houses lying between Tottenham Court Road and Boziers Court. By this arrangement the western side of Boziers Court will become the western side of Tottenham Court Road.—The Chairman, after a brief consultation with the other members of the Committee, said: Under the present circumstances the Committee consider the preamble on this part of the Bill has been proved.—The Committee then adjourned.

The Edinburgh committee entrusted with the arrangements for celebrating the Queen's Diamond Jubilee has resolved to proceed with the erection of a special pavilion at the Royal Infirmary, the sum aimed at being £50,000.

A PUBLIC inquiry was held at the Municipal Offices, Harrogate, on the 18th inst., by Mr. Rienzi Walton, on behalf of the Local Government Board, with respect to the application of the Corporation for the loan of £22,500, with which to purchase the Spa Estate.

ARTISTS will hear with regret of the death of Mr. R. A. Brownlie, whose humorous drawings signed "R. A. B." had earned considerable popularity and appreciation. Mr. Brownlie was a Scot with a keen sense of humour, and he translated this humour into a style of draughtsmanship peculiarly his own.

A MOVEMENT for the restoration of the Twickenham Old Parish Church tower, all that remains of the original building, erected, it is supposed, under the superintendence of William of Wykeham, about the middle of the fourteenth century, has been set on foot in celebration of the Queen's reign.

ON account of an unexpected delay in the process of production, the publication of the second volume of Mr. Edwin O. Sach's work, "Modern Opera Houses and Theatres" (B. T. Batsford), due this month, will have to be postponed until June. Owing to this later issue the author has, however, now been able to include some plates of Mr. Tree's new theatre lately opened, and also of the new Opera Comique at Paris, which is nearly completed.

## Professional Items.

**ABERDEEN.**—The Town Council has passed the following plans of new buildings:—Yard and shed at Allenvale, for the Allenvale Granite Company, per Mr. Duncan Hodge, Architect; alterations at No. 14, Stafford Street, for Mr. W. C. Thomson, per Mr. William Ruxton, Architect; stone-polishing mill on the east side of King's Crescent, for Mr. William Rae, per Mr. William Smith, Architect; alterations at No. 51, Fountain Hall Road, for Mr. Peter Morton, per Messrs. James Garvie and Sons, builders; alterations at Nos. 15 and 17, South Mount Street, for Mr. Alexander Riddell, Coull; additions at No. 15, Roslin Terrace, for Mr. William Greig; mason alterations at No. 33, Bon-Accord Street, for Mrs. McLean, Bon-Accord Street, per Messrs. James Garvie and Sons, builders; alterations and additions to St. John's Church, for the Vestry, per Mr. Arthur Clyne, Architect; two dwelling-houses on the south side of Ashvale Place, for Mr. A. J. W. Storie, per Mr. John Cameron, builder; two dwelling-houses on the west side of Forest Road, for Mr. John Morgan, builder; workshop on the east side of King Street, for Mr. John Kirton, per Mr. William Smith, Architect; workshop on the east side of Canal Road, for Mr. William Mollison, per Mr. Duncan Hodge, Architect; locomotive shed in connection with the Gasworks, at Cotton Street, for the Town Council, per Mr. Alexander Smith, engineer; mission hall on the west side of West North Street, for the Belmont Congregational Church.

The committee which has charge of the arrangements in connection with the proposed new Free Church at Mile End has resolved to proceed with the work, and has agreed to consult with Dr. Rowand Anderson, referee as to the designs, as to having the basis of these specifications drawn out in order that offers may be taken in for the work. It has been left for a future meeting to determine whether a hall shall be first built and used for a short time, or whether it will be more advisable to proceed at once with the erection of a Church.

**BALLINTUBBER.**—The foundation-stone of the new Church of St. James at Ballintubber was laid a few days ago. The building is in the Italian style, and will consist of nave, transepts, chancel, sacristy, and organ gallery. The measurements comprehend a building of 102ft. in length, of 61ft. in breadth, and 27ft. across the transepts. There are, in addition to the high altar, two side altars, a three-light chancel window, and ten windows at each side of the nave. The contractor is Mr. John Whelan, of Strokestown.

**BLACKBURN.**—The foundation-stone of new day schools in connection with St. Anne's Roman Catholic Church, Blackburn, was laid a few days ago. The building, which is being erected by Messrs. Keeley and Sons, contractors, Blackburn, from plans prepared by Mr. Oswald C. Hill, will be of two stories. The infants' and boys' departments, and two classrooms for boys, will be on the ground floor, which will be fire-proof, while upstairs will be the girls' school. Accommodation will be provided for 1000 scholars, and, including furnishing, the building will cost £7000.

The new organ just erected in the Primitive Methodist Chapel, Montague Street, was opened recently. The organ has been erected by Mr. Edwin Smith, of Blackburn.

**BLAIRGOWRIE.**—Estimates have just been accepted for the erection of a block of self-contained dwelling-houses in David Street, from plans by Mr. Robert Reid, Architect. The following are the contractors:—Mason work, Bailie Hill; joiner, Mr. David M'Ritchie; slater, Mr. William Craigie; plumber, Mr. Robert Kidd; plasterer, Mr. Joseph Bell; all of Blairgowrie.

**BRISLINGTON.**—The directors of the Great Western Railway have decided to erect a passenger station on their main line at St. Anne's

Park. The station buildings themselves will consist of "up" and "down" platforms, 400ft. in length, having booking-offices, waiting-rooms, covered footbridge, and every modern convenience. The main approach will be by a 36ft. road turning out of the public highway at the southern end of St. Anne's Wood, and approaches are to be given by two specially-constructed footways leading to the upper parts of the estate, which is being laid out in broad avenues for the erection of a most attractive class of small villa residences. The contractor for the new station is Mr. Samuel Rober'son.

**CARNOUSTIE.**—The Police Commissioners decided some time ago to erect new Municipal Buildings at the corner of High Street and Lochty Street, and invited several Architects to send in competitive drawings. The result was that those prepared by Mr. James P. Bruce, Commercial Street, Dundee, and Carnoustie, were selected. The main entrance to the building will be from High Street. On the ground floor accommodation is provided for all the burgh officials, and also for the Inspector of Poor. Here, too, is the strong room, and on the same floor is also a large lavatory, isolated from the main building. On the first floor, access to which is got by a large handsome staircase, is situated the council chamber, a commodious room measuring 30ft. by 20ft., and also a committee-room, 14ft. by 20ft., and a retiring room for the commissioners. Rooms, with all conveniences, are provided here, too, for the caretaker. The elevation to High Street is a free treatment of Renaissance.

**COLNE.**—Mr. W. P. Hartley, J.P., of Aintree, has offered to build and furnish a cottage hospital for Colne, the cost of the land and building to be about £3000, on condition that the people of Colne subscribe a similar amount for an endowment fund.

**DARLINGTON.**—An inquiry has been held by an Inspector of the Local Government Board with reference to a proposal of the Darlington Corporation to borrow £30,000. The evidence of the Borough Accountant and Borough Surveyor was that the gas supply was becoming inadequate to the town's requirements, and permission was sought to the borrowing of the above amount for present and future enlargements. The works had cost up to the end of last year £105,267, of which £30,267 remained unliquidated. The works had been built to produce 600,000 cubic feet of gas per day, but they had produced as much as a million and a quarter cubic feet in one day.

**DUNDEE.**—Two of the principal buildings in course of construction in the centre of Dundee are now nearing completion. The masonry of the new Post Office should be practically completed within the next ten days. That of the west front is already finished; the corner towers are ready for their domes; and the south face requires but little additional work. The joiners have begun the roofing of some of the back premises, but the roofing of the main structure will not be commenced until next week. At the new Prudential Assurance block in Meadowside, the offices on the upper flats will be ready for occupancy at the approaching term. The Company itself, however, which is to occupy the ground floor, will not enter the new premises until August at the very earliest. Progress at the Pearl Assurance buildings is meantime delayed on account of the non-arrival of the granite. A large amount of the stonework has already been hewn in the builders' yard, so that when the granite comes to hand operations will be rapidly pushed forward.

**EDINBURGH.**—Mr. James Gillespie is the Architect for the St. Andrews University new medical building, the plans of which have been passed. The building provides accommodation for the departments of materia medica, practical physiology, botany, and anatomy. Each department consists of a laboratory, lecturer's room, and museum. In the front block there are also cloak-rooms for the students, lecturers' common room, and a room for the janitor. The anatomical section occupies the most of the

back block, and comprises a lecture theatre, a large practical anatomy room, a preparation room, cellars, and a lift to the preparation room. Ample cloak-rooms for the students are also provided. The building is to cost about £10,000, and the funds are being provided by the Marquis of Bute.

The building of a new fever hospital at Colinton Mains has been commenced. This hospital is designed to give accommodation for 600 patients, and the cost is calculated at £400 per bed, so that exclusive of the site the building will involve an expenditure of about a quarter of a million pounds. The area proposed to be occupied by the hospital and the administrative offices extends to over 30 acres, but there is a desire on the part of some members of the Corporation that this area should be considerably extended. The hospital has been arranged on the pavilion system, something similar to the Edinburgh Royal Infirmary. There will be about a score of pavilions, seven of which will be set apart for scarlet fever patients, who form the largest number of infectious cases. The Architect is Mr. Robert Morham.

**FARSLEY.**—The Farsley District Council has adopted a plan and particulars, prepared by Mr. W. D. Gill, Architect, for the proposed widening of the main street of Farsley, which is crooked, and in some places narrow. The scheme provides for the widening of the street on the west side, and the cost is estimated at £10,872.

**GOMERSAL.**—Memorial stones have been laid in connection with the erection of new classrooms for the Wesleyan Sunday School, West Lane, Gomersal. The new class-rooms, together with a fence wall to the extended burial ground, and a few other improvements, are expected to cost about £1100, towards which £500 has already been raised.

**GRAYS.**—A new elementary school is about to be erected at Grays from the designs of Mr. Christopher M. Shiner, of Walbrook, E.C.

**LEEDS.**—The Meadow Lane Gas Committee has approved of plans for an extension of the exhaustor-house, and for additions to the station meter-house, in order to accommodate another meter. It has also been resolved to obtain tenders for hydraulic mains for the new retort-house. The tender of Messrs. Clayton, Son, and Company, Leeds, for travelling cranes and lime elevator has been accepted at £620.

Builders are very busy in Leeds just now. New houses are in course of erection in every direction, and still more are in contemplation. The Building Clauses Committee had recently no less than 116 plans of new dwellings to consider. These were chiefly for cottage property in Bramley, Beeston, Hunslet, Holbeck, Headingley, and the other suburbs. The plans also included several semi-detached villas that are proposed to be built in New Leeds.

The plans for the erection of the proposed Empire Palace Theatre, two arcades, and a number of shops upon a site on the east side of Briggate have now practically received the approval of the Leeds Building Clauses Committee. At a meeting of the committee, Mr. Batley, the chairman, stated that the promoters of the scheme had expressed themselves willing to amend their plans in any reasonable way in order to meet the wishes of the committee. He had suggested to them a few detail alterations which would render the music hall safer for visitors in case of an outbreak of fire. The committee endorsed Mr. Batley's action, and, subject to the suggestions being adopted by the promoters, the plans were passed. It is expected that the work will be commenced at once, and that it will be completed with all possible expedition.

**LEITH.**—Among the improvements which the Leith Dock Commission is at present carrying out is a building for the marine police. The structure, which has been erected at the Constitution Street entrance to the Albert Dock, takes the form of a cottage surmounted by a turret. It is built of red freestone, and

contains an inspector's room, muster room, and cell accommodation. Messrs. J. Lamb and Son are the contractors.

**LLANDAFF.**—It is the intention of the Dean and Chapter to provide a new organ at Llandaff Cathedral, conditionally on their effecting the sale of the one at present in use. The old instrument is of the Gray and Davison make, and was erected in the Cathedral about thirty years ago. It is a three-manual organ, and is in good condition.

**MARSDEN.**—The enlargement of premises and new suite of vestries at Marsden Wesleyan Chapel is rapidly progressing. The present building was erected in 1871, and consists of a chapel 54ft. by 42ft., with small north gallery, with an assembly-room, and five small class-rooms on the ground floor. It is proposed to lengthen the chapel 15ft., the sitting accommodation being increased about 130 sittings, and to add an organ recess, minister's vestry, choir vestry, and lavatories. The increased school accommodation will be for 220. The new buildings will be substantially built of local stone, in character with the existing chapel. The work is being carried out by the following contractors:—Masons, Whitehead, Fielding, and Bradbury; joiner, James Schofield; plasterer, painter, and concreter, John Bottomley; plumber, F. Goodall; ironfounders, R. Taylor and Sons, all of Marsden; and slaters, Pickles Bros., of Huddersfield, from the plans and under the superintendence of Messrs. John Kirk and Sons, Architects, Huddersfield and Dewsbury. The total outlay will be about £2000.

**NOTTINGHAM.**—The buildings of the Prudential Assurance Company, Limited, which form the junction of King Street and Queen Street, Nottingham, are now open. The principal entrance, surmounted by a tower and spire, occupies a commanding position. The steep gradient which affected both the plan and the elevation has been cleverly utilised by the Architects, Messrs. A. Waterhouse and Son. There are spacious entrances to the building on each side of the upper end of the slope, from King Street and from Queen Street; and in King Street is the entrance to the high-class restaurant now opened to the public by Messrs. Spencer. This restaurant, which is fitted in the latest and most comfortable style, is in the basement of the building, and has a most attractive approach. The triangular hall, access to which is given from the main entrance, is covered by a glass roof, and galleries run along the sides of the hall to the various offices. Mr. J. Hutchinson is the builder.

**SHEFFIELD.**—The new premises of Messrs. Nicholson, Greaves, Barber, and Hastings, occupy a prominent position at the corner of Fargate and High Street. The frontage of the premises is in the French Renaissance style. The entrance vestibule is paved with marble mosaic of bold design, and has a handsome tile dado. The system of ventilation adopted comprises a Blackman's 50-tube heater and a fan driven by an electric motor, capable of supplying 150,000 cubic feet of fresh air per hour at any desired temperature. Messrs. Flockton, Gibbs, and Flockton designed and planned the building, and Mr. James Fidler is the contractor.

**STONEHAVEN.**—The Stonehaven Golf Clubhouse, now being erected on a very picturesque site almost directly opposite the old Cowie Church, is to be built of timber, lined outside with 9in. by 3in. plowed boarding, with fillets on joints with hollows on edges, and the walls and ceilings inside will be lined with narrow, bevel-jointed linings with wooden cornices. The dimensions of the clubhouse are 42ft. 6in. by 18ft. 6in., having clubroom, ladies' room, and ample lavatory, &c., accommodation. The roof will be slated with red slates, having buff terra-cotta ridging and terminals. Contractors for the work are: Masons—William Smith and Co., Stonehaven; carpenters—Robert Thomson and Sons, Stonehaven; plumber—Alexander Mathieson, Stonehaven; slater—George

Davidson, Aberdeen; painter—Edward Copland, Aberdeen.

Plans have been sanctioned for the erection of additions to St. James's Episcopal School, Stonehaven. These comprise new class-rooms, retiring-rooms, cloak-rooms, lavatories, also new staircase. The elevation, which is of Gothic design, will be a decided Architectural addition to the town. The work, which is to be commenced at once, will be carried out by the following contractors:—Masons—Messrs. William Smith and Co., Stonehaven; carpenters—G. Mitchell and Son, Stonehaven; slater—C. Maitland, Aberdeen; plumber, E. Pithie, Stonehaven; plasterer—A. Cormack, Stonehaven; painters

THE COLOSSEUM PORTABLE FOLDING STAND. OPEN.

and glaziers—Barron and Son, Aberdeen. The Architect is Mr. J. Augustus Souttar, Aberdeen.

**WALTON.**—The foundation stone of the new Presbyterian Church of England, Walton, was laid on the 15th inst. The building scheme includes the purchase of the site, erection of the lecture hall, with requisite committee rooms, &c., and Church. The lecture hall, where the services are at present carried on, has been completed at an inclusive cost of about £2000, and the new Church will be completed by the contractors on or before the 1st of March next. The cost of the Church and hall is estimated at £5500, the acquirement of the site and the probable purchase of an organ bringing up the total to £6600. The sole contractors are J. and G. Chappell; Mr. J. MacDermot is the mason, and Mr. R. G. Sykes the Architect.

**WHEATLEY.**—Mr. S. Meacock, Chairman of the Wheatley School Board (Doncaster), recently opened new schools at Wheatley. The land cost £675, but owing to a quarry having to be filled up the net cost was £993. The contract amounted to £3060, which is equal to £6 16s. per scholar. The builders were Messrs. Mullins and Richardson, and the Architects Messrs. Athron and Beck, of Doncaster.

The foundation stones of a new Wesleyan mission hall were laid at Derby on Saturday, the 15th inst.

The contract for the construction of the railway extension by the Barry Company into the Rhymney Valley has been let to Messrs. Price and Wills at an estimated cost of £300,000.

The engineering experts called in by the Tyne Commissioners to report upon the damage to the North Pier at the mouth of the Tyne, caused by the severe gales last winter, assert that it will be necessary to reconstruct the whole pier at an estimated cost of £300,000.

## Trade and Craft.

"THE COLOSSEUM" PORTABLE FOLDING STAND.

The accompanying illustrations represent a patent folding stand which has just been opportunely brought out by Messrs. S. J. Waring and Sons, Limited, of Oxford Street. It is the invention of Mr. C. Dexter Barker of their staff, and is designed for use in shop windows for the accommodation of persons viewing the Royal Procession. The benches, as one illustration shows, are arranged one behind another with a gradual ascension, and attached to each bench is a hinged footboard capable of being folded against the front of the bench. Each bench with its footboard is mounted to turn upon pivots formed in diagonal side-frames, the extremities of

which are also pivotted in vertical supports. Thus the erection or taking down of the stand, even to an unskilled person, is a matter of only a few minutes, the whole structure, when folded, occupying a height corresponding approximately with the width of the benches, and only slightly exceeding in length that of the diagonal side-frames—a stand which will, therefore, pass through any ordinary door or window without difficulty. They are perfectly rigid and strong when open, and being a durable structure, can be used subsequently as grand-stands in tennis courts or recreation grounds. Messrs. Waring supply them in various sizes, in deal—plain, stained, painted, grained, or covered in baize. The cost of a stand to seat twelve is £3 12s. The use of "The Colosseum" will, at any rate, obviate the necessity of having workmen about, and prevent the disappointment consequent upon labour and materials—which will certainly be at a premium when the Greater Jubilee draws a little nearer—being not forthcoming.

STUART'S GRANOLITHIC STONE COMPANY, LIMITED.

A work which should reach the hands of engineers, Architects, and others interested in the construction of fire-resisting buildings, has just been issued by Stuart's Granolithic Stone Company, Limited, which indicates the extent to which this system is now being adopted in all classes of buildings throughout Europe and America. Mr. P. Stuart, F.R.S.A., inventor of the system, and the managing director of the Company, in developing the production of the granolithic material, has obtained the most widespread recognition of its merits as a light, strong, fire-resisting flooring, and the fact that over three million feet of the material has been used in constructions of one kind or another indicates in a practical way its value in building works. Numerous illustrations are given in the work under notice of the Company's extensive premises at Limehouse, London, and of various remarkable tests to which the material has been subjected. Those interested

in the foundational part of the operations will note some excellent views of the crushing mills at Dalbeattie; and thence will pass conveniently to the elaborate views of buildings in which granolithic flooring, staircases, &c., have been laid—the great Jenner block in Princes Street, Edinburgh, being a notable example, whilst the City of Manchester Municipal Technical Schools, Birmingham Municipal Technical Schools, and the new Town Hall, Brighton, may also be mentioned. The later illustrations take one to the Continent and to America, where also the granolithic stone is used for many purposes, from street paving to the elaborate internal decorations of imposing public buildings.

## FIREPROOF WOOD.

The Prince of Wales recently witnessed a trial of a fireproof wood on the waste ground behind the Tate Museum, where Millbank Prison formerly stood. Two model houses of wood were erected, precisely similar in design, but whereas one was constructed of ordinary material, the other was made of wood treated by the process it was intended to illustrate. On the windward side of each a pile of faggots was heaped and saturated with paraffin oil, so as to make a good blaze, and at the appointed hour a light was set to each simultaneously, with the result that the ordinary wooden building was soon ablaze, and collapsed in about twenty minutes, while the other suffered no more harm than the blistering off of the paint and the charring of the woodwork immediately in contact with the flames. We believe this is the first time that wood treated by the non-inflammable process has been tried in England, though, according to the printed history which was distributed, it has long been used in America, and has become compulsory in the United States Navy, and for many kinds of buildings. The process seems to consist of first extracting mechanically all the natural sap and gases of the wood, and then replacing them under pressure with some non-inflammable chemical substance, possibly silicate of soda or an ammonium salt. The wood has a caustic taste due to the substance with which it is impregnated, but is otherwise indistinguishable from ordinary wood. It takes a perfect polish, as the panels which were exhibited show, and it is said to work without difficulty or injury to tools.

## ELECTRIC TRACTION FOR GLASGOW.

When the Glasgow Corporation took over the tramways it was on the understanding that

Now the report from twelve cities in the United States showed, for the electric overhead system, a cost, with one exception, of 2d. per car-mile; in most cases it was really from 1½d. to 1¾d. per car-mile, while two of the more recent companies formed—in Montreal and North Chicago—were working for ¾d. per car-mile. Even at 2d. per car-mile Glasgow stands to save £60,000 per annum, while at the same time increasing the receipts, for instead of forty-passenger vehicles there will be used electric motor-cars accommodating eighty passengers. The Corporation has decided to have a separate station rather than generate the current at the lighting station.

## MESSRS. WINSTONE AND CO. LIMITED.

That important feature of the ordinary room, the fireplace, has, within recent years, been the subject of considerable experiment, with the view of obtaining the best means of simple common-sense combustion. The success which has been attained is emphasised by the catalogue of Messrs. Winstone and Co. Limited, Finsbury Pavement, E.C., containing as it does illustrations of almost every pattern of stoves, mantels, and ranges. The designs vary in their degree of beauty, for of course the great point with cooking-stoves and the like is to ensure a quick, clear, red-hot fire with the greatest economy of fuel, and the minimum of smoke and dirt. At the same time Messrs. Winstone and Company have happily combined "modern Art" with their modern improvements, and a great number of their mantels and stoves cannot fail to impress one with their beauty, and often with their novelty. Fancy glazed tiles and enamelled decorations are pleasingly introduced in carrying out what in themselves are pleasing designs. And we would specially mention the wooden chimney-pieces, the material of which has undergone special drying process to prevent otherwise possible shrinkage. These wooden chimney-pieces are made in pine, mahogany, walnut, &c., and at prices far below what was at one time thought possible. Heating stoves, radiators, &c., are also catalogued by Messrs. Winstone and Company.

MR. ROBERT WILLEY, 33, New Bridge Street, is the Architect whose plans have been adopted for the enlargement of St. John's Schools, Ealing Dean, for the Educational Association of Ealing.

AN inquiry was recently held concerning the application of the Keighley and Bingley

THE COLOSSEUM PORTABLE FOLDING STAND. SHUT.

some means of mechanical traction should be adopted. The improvements almost daily reported in electric traction suggested caution, and in August, 1895, a committee of the Corporation was appointed, and it sent deputations over the Continent, and afterwards to the States, with the result that all opposition to the trolley system was dissipated in their minds. Sheffield, Belfast, Leeds, Blackburn, Dublin, and other places have been even more active, but now the Corporation has agreed to fit an independent line from the centre of the city through St. Rollox to Springburn, at a cost of £20,000, so that the efficiency and economy may be tested. Horse haulage in Glasgow cost, as a rule, 4d. per car-mile, but a failure of the crop in the States runs up fodder charges.

Joint Hospital Board to borrow £1900 for the removal of the temporary smallpox hospital. The new site has cost £1000.

At Cliffe, near Rochester, the Parish Church of St. Helen, which has been restored at a cost of nearly £3000, was opened on Saturday, the 15th inst.

MR. SKEUTT, of Belper, is about to erect a tower and clock at that place, in commemoration of the Diamond Jubilee. They are to cost about £4000.

The foundation stone of a new Church at Walton has been laid at the corner of Rice Lane and Orrell Lane. About £5500 has already been collected, but another £1000 will be required to cover the cost of the erection of the Church and the lecture hall.

## SOCIETY MEETINGS.

**The Architectural Association.**—The scrutineers' report on the election of officers for 1897-98 was read at the meeting of the Architectural Association—the last of the present session—held under the presidency of Mr. Beresford Pite on Friday night. They stated that 305 voting papers were used, and of this number 4 were invalid. The officers were elected as follows, the figures representing the number of votes:—President: Mr. Hampden W. Pratt, 292. Vice-presidents: Mr. Banister F. Fletcher, 288; and Mr. Arthur H. Hart, 295. Committee: Messrs. Beresford Pite, 237; G. H. F. Prymne, 222; R. S. Balfour, 219; F. G. F. Hooper, 214; F. T. W. Goldsmith, 182; W. H. Seth-Smith, 176; H. B. Creswell, 163; C. de Gruchy, 159; T. W. Aldwinkle, jun., 144; and W. D. Caroe, 142. Hon. treasurer: Mr. Hampden W. Pratt, 297. Hon. librarian: Mr. C. H. Freeman, 297. Hon. secs.: Mr. E. Howley Sim, 294; and Mr. G. B. Carvill, 295. The above will form the committee. The other officers elected were as follows, each having received 301 votes: Hon. solicitor, Mr. W. H. Jamieson; hon. assistant librarian, Mr. E. W. M. Wonnacott; hon. auditors, Mr. M. Carbutt and Mr. H. P. G. Moule; assistant secretary, Mr. D. G. Driver.—A vote of thanks was accorded to the scrutineers, whilst similar compliments were paid to Mr. E. T. Hall, who had granted the Association permission to inspect the Park Hospital, Lewisham; to the Entertainments Committee and to Messrs. Carvill & Co. for the soirée play; and to the Royal Institute of British Architects, it having, it was announced, for the sixth year made a grant of £100 towards the educational scheme of the Association.—The President also announced the award of the travelling studentship of the Association, the Prizes Sub-Committee "having unanimously recommended that Mr. E. H. Evans should be elected, for, though the finished drawings of Mr. Evans and Mr. Waring show great care, yet Mr. Evans's drawings made on the spot were so superior that the decision could not be doubtful. Mr. Waring is commended for his care in finished work, but is advised in future to devote more time to study on the spot." Messrs. S. Bridges, J. S. Collings, and G. L. Elkington were elected members of the Association, and Messrs. Arthur Cates and S. C. Baker were reinstated members.

**Devon and Exeter Architectural Society.** The members of the Devon and Exeter Architectural Society recently visited the extension works at Keyham. Some little time was spent in looking over the plans. The two basins will measure 35½ acres and 10 acres respectively, the larger being the closed basin, and the smaller the tidal basin. There will be three docks, the largest of which will be a foot or two short of 750ft., and capable of docking the largest ship at present afloat. The other two docks to be built will measure about 500ft. long. The work is, as yet, in its initial stage, having only been commenced in March, 1896. The extensive nature of the excavations and the system of "timbering" proved deeply interesting features.

The annual meeting of the above Society was held at Devonport on the 15th inst., Mr. Arnold Thorne, President, in the chair. The Hon. Secretary (Mr. Harbottle Reed) presented the annual report, which, among other matters, referred to the Plymouth, Devonport, and Stonehouse Branch having received the support of the Society in its action with regard to paid officials undertaking private work. It was encouraging to be able to report that the Council were asked to make suggestions with regard to a competition for designs for a drinking fountain and clock tower at Exeter, and several of the suggestions had been adopted. The Plymouth, Devonport, and Stonehouse Branch had made a vigorous start, and during the year past several lectures have been given to its members. The roll of membership now stood as follows:—Members, 1897, 48; 1896, 43; associate members, 1897, 11; 1896, 13; associates, 1897, 16; honorary members, 1897, 4; 1896, 3; total, 1897, 79; 1896, 75. One member and one associate member had retired. The

adoption of the report was moved by Mr. Cole, seconded by Mr. King, and carried. A satisfactory balance in hand was shown in the statement of accounts presented by the hon. treasurer (Mr. O. Ralling). A prize, given by the Society for measured drawings, won by Mr. J. H. Vincent (Plymouth) was presented by the president (Mr. Thorne), who then gave an address, in which, after traversing some questions of professional practice, he said he would ever remember with gratification his experience of the last two years, and he was glad that upon him devolved the pleasing duty of proposing as his successor Mr. James Hine, of Plymouth.—Mr. Luff seconded the nomination, and Mr. Hine was duly elected.—Mr. Hine thanked the members for electing him.—Mr. Priestley Shires proposed that thanks for his past services be tendered to the retiring President, who had shown so much interest in, and worked so hard for, the benefit of the Society, and especially in attending so many meetings.—Mr. King seconded, and the vote was accorded.—Mr. Thorne briefly replied.—Mr. Cole seconded the hearty vote of thanks, which Mr. Harbottle Reed acknowledged.—Messrs. C. King, Chairman of the Three Town Branch, Plymouth, Mr. G. S. Bridgeman (Paignton), and Mr. C. J. Tait (Exeter) were elected members of the Council. Luncheon was partaken of at the Royal Hotel, Devonport. A visit was made to the harbour extension works at Keyham, where the members were received by Mr. Elliot, Superintendent Civil Engineer, who conducted the party over the site, and explained the works being carried out by Sir John Jackson, whose contract will probably amount to about £3,000,000. Some idea of the extent of the operations in progress was gained from inspecting the excavations, which are sunk in the rock to a depth of over 60ft., for the dock walls adjoining the large basin. The latter will have a water surface of about 35½ acres.

**The Surveyors' Institution.**—At a meeting of the Surveyors' Institution last week, held under the presidency of Mr. Daniel Watley, Mr. H. Chatfeild Clarke moved the following resolution:—"That this meeting desires and trusts that the Council will forthwith consider the advisability of presenting a dutiful address on behalf of the Institution to the Queen's Most Excellent Majesty to congratulate her upon the completion of the sixtieth year of her glorious reign." Mr. Clarke remarked that it was hardly necessary that he should say much in support of the resolution, the terms of which, he felt certain, would meet with entire approval. They, one and all, both as surveyors and Englishmen, were proud of their Queen, and rejoiced that Her Majesty's glorious reign had been prolonged for so many years. He submitted a draft of a suitable address.—The motion was seconded by Mr. Philip E. Pilditch and unanimously agreed to.—A discussion afterwards took place on the paper read by Mr. J. H. Redman on "Some legal incidents of tenancies of urban property as illustrated by recent decisions." Those taking part in the discussion were Messrs. P. E. Pilditch, F. K. Murton, H. Chatfeild Clarke, Howard Martin, T. W. Wheeler, Q.C., J. H. Sabin, C. H. Bedells, and W. H. Warner.

**Essex Archaeological Society.**—The Essex Archaeological Society visited Mersea a few days ago to inspect the remains of a large Roman building, recently discovered near West Mersea Hall. East Mersea Church, with the remains of the large earth-work surrounding it, was inspected, and a short paper on the early history of the moat was read by Mr. H. Laver, F.S.A., who also pointed out the supposed site of the camp to which the Danes retreated after their defeat by Alfred, A.D. 897. West Mersea Church was also visited, and attention was directed to the evidences of the Saxon character of the tower and to its position on the site of a Roman villa, and to the probability of the base of the font being formed of a portion of a column of a Roman building, and also to the fact that much of the stonework of the building is certainly of Roman masons' work. After this inspection a move was made to the recently uncovered Roman building, which is of extreme interest from its

size and the solidity of its construction. It is suggested that upon the recently discovered foundations a private theatre was built somewhere about the second century by the owner of the villa near by. The site of the theatre is said to be the only one discovered in the country.

## Correspondence.

### ROYAL ACADEMY EXHIBITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Owing to a clerical error, Mr. Arthur R. G. Fenning's name was omitted from the catalogue of architectural illustrations now in the Academy, as being joint Architect with me of the design for the new Presbyterian College at Cambridge.

In justice to him, I shall, therefore, feel greatly obliged if you can find space to insert this letter in your next issue.

Yours obediently,

W. HOWARD SETH-SMITH.

46, Lincoln's Inn Fields, W.C.

May 11th, 1897.

### R.I.B.A. ELECTIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to a letter published last week by one of your contemporaries in which my candidature is mentioned, kindly permit me through your columns to state that I gave up practice, not two years ago, but so far back as 1888, and further that it is incorrectly stated that I am engaged by the London County Council in a capacity inconsistent with the profession of Architecture; were it otherwise I should have been liable to suspension or expulsion under the provisions of bye-law 22 of the R.I.B.A.

The Register of Fellows and Associates contains the names of about sixty Architects who are officials in Her Majesty's service or engaged upon the staff of County Councils and other public authorities (exclusive of Metropolitan District Surveyors and members in public employment who give private addresses); it is not at all unreasonable to find that some of these prefer to be represented by one of themselves on the R.I.B.A. Council, rather than exclusively by practising Architects.

Two allied societies of the R.I.B.A. have each only three members of the Institute on their lists of members, and yet each society may return a member for the Council; Architect-officials in public service, therefore, should have further representation.

Yours faithfully,

Hampstead, N.W. GEORGE H. BIBBY.

May 22nd, 1897.

### THE LATE GEORGE GILBERT SCOTT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR—I am sincerely glad to find from your kindly notice of my late friend, Mr. G. Gilbert Scott, that his works are to be illustrated in the Architectural Review. I have been more than surprised at the way his death has been passed over in the architectural papers. It seems incredible that so great an Architect should have been allowed to pass away without a word of recognition.

I have not had the good fortune to see his Church at Norwich, but I know the others you name, and entirely agree with your estimate of them, and I also know several of his works in village Churches which are equally vigorous, refined, and original.

I am, Sir, yours faithfully,

C. HODGSON FOWLER, F.S.A.

The College, Durham,

May 20th, 1897.

### CHELSEA EMBANKMENT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It would be curious to enquire whether it was sentiment or a desire to administer a rebuff to the London County Council which induced a Committee of the House of Commons to decide that so much of the preamble of the Bill promoted by the Council for the extension of Chelsea Embankment was not proven. The

Bill, at the outset, encountered considerable opposition from Artists, who, in the friendly columns of the Times newspaper, vented their griefs, and complained that the Council was about to deprive them of a happy hunting ground for the picturesque, but the *coup de grace* was given to this part of the Bill by Mr. W. D. Caröe, who, in his evidence, explained that he had taken the house in Cheyne Walk formerly occupied by Mr. Whistler solely on account of the view from the windows, which, he considered, would be destroyed if the proposed Embankment were carried out, and produced a sketch taken from his house the day before by Mr. W. L. Wyllie, which appeared to convince the Committee, as they at once threw out that portion of the Council's Bill relating to the Embankment. Who will say after this that the House of Commons is indifferent to sentiment? Lawyers aver that there is no property in prospect, but the House of Commons Committee appear to hold the doctrine that the people of Chelsea are entitled to retain their present prospect from Cheyne Walk, in spite of the London County Council and the Vestry of Chelsea.

The action of the Council and the Vestry recalls the adjuration in Mason's heroic epistle to Sir William Chambers:

Haste, bid yon livelong terrace re-ascend,  
Replace each vista, straighten every bend;  
Shut out the Thames.

and it is a matter for congratulation that this action has been defeated.

H. J.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS and SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St  
Strand, W.C.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—For the construction of pipe-sewers, &c. Walker-road and several other roads, for the Town Council. Mr. Wm. Dyack, Burgh Surveyor, Town House, Aberdeen.

R. M'Kay, Abergeldie-road ... £84 15 9

R. M'Kay ... Orchard-street ... 43 15 6

Morningside-road ... 536 1 1

AUDENSHAW.—For sewerage, kerbing, flagging, and paving Whitehead-street, Church-street, and West-street, for the Audenshaw District Council. Mr. J. H. Burton, Surveyor, 2, Guide-lane, Hootley Hill.

T. Cooper ... £912 5 9

H. Kinder ... 868 1 2½

R. Fish ... 844 1 10

Worthington and Pownall, Manchester ... £238 9

\*Accepted.

BANSTEAD.—For erecting new schoolroom and alterations to girls' school at the Banstead Schools, Surrey, for the managers of the Kensington and Chelsea School District. Mr. Cecil A. Sharp, Architect, 39, Fenchurch-street, E.C. and 24, Grainger-street West, Newcastle-on-Tyne. Quantities by Mr. S. B. Beale, 3, Princes-street, Westminster.

General Builders, Dashwoods, Ltd. ... £1,983

Ltd. ... £2,350 0

F. Smith and Son ... 1,975

Stevens and Sons ... 2,050 0

S. Hart ... 1,967

Balchin & Shopland ... 1,997 0

Akers and Co. ... 1,967

E. T. Burnand, Wallington, Surrey ... 1

J. B. Potter ... 1,985 0

\*Accepted.

**BELFAST.**—For the erection of the West Belfast Orange Hall and caretaker's residence, Shankill-road, for the Committee. Mr. Wm. Batt, Architect, Garfield-chambers, Royal-avenue, Belfast:—  
 J. Kidd ... £2,550 0 0  
 J. Killen ... 2,500 0 0  
 W. Campbell and Son ... 2,500 0 0  
 Fitzpatrick Bros. ... 2,400 0 0  
 M. Hearst ... £2,450 0 0  
 J. Hemmingway ... 2,413 0 0  
 Campbell and Sowry ... 2,301 9 6  
 \* Accepted.

**HELPER.**—For the erection of an isolation hospital, Cricklane, for the Corporation. Mr. M. Hunter, Architect, Bridge-street, Belper. Quantities by Mr. John Watson, Cognin-chambers, Hull:—  
 Gwom and Co. ... £7,170 0 0  
 Attingley ... 7,132 7 0  
 Bodell and Sons ... 7,008 15 0  
 Ford and Co. ... 6,850 0 0  
 Walker & Slater ... 6,800 0 0  
 J. F. Price ... 6,780 0 0  
 H. Robinson\* ... £6,466 5 6  
 W. Moss and Sons, Loughborough ... 6,480 0 0  
 H. Jordan ... 6,123 10 0  
 W. Shaw\* ... 5,550 0 0  
 \* Withdrawn. \* Accepted. \* Excluding heating. \* Excluding roads, drainage, and heating.

**BLSTON (Staffs).**—Accepted for the erection of four houses, Willenhall-road, for Mr. W. Bishop. Mr. J. Mason, Architect, 86, Darlington-street, Wolverhampton:—  
 Benj. Guest, Wolverhampton ... £1395 10

**BLACKBURN.**—For the erection of a laundry at the workhouse, for the Union Guardians. Mr. Jas. Aspinall, Architect, Victoria-street, Blackburn:—  
 Masonry and Bricklaying.—R. Webster, Blackburn ... £1,409 0 0  
 Joinery.—J. Highton and Son, Blackburn ... 304 0 0  
 Slating.—W. Foster and Sons, Padham ... 174 0 0  
 Plumbing.—P. Walsh and Son, Blackburn ... 105 0 0  
 Painting.—W. Dickinson, Blackburn ... 40 14 6

**BLACKBURN.**—For the erection of chimney at electricity works, Jubilee-street, for the Corporation. Mr. E. M. Lacey, Engineer, 10, Delahay-street, S.W.:—  
 R. B. Hilton and Son ... £1,545 0 0  
 James Hilton ... 1,445 14 0  
 Mylce & Warner ... 1,234 0 0  
 John Cronshaw ... 1,150 0 0  
 W. J. Woolf Cronshaw, 28, Montague-street, Blackburn\* ... £950 0  
 \* Accepted.

**BLAENGARW (Wales).**—For the erection of an hotel, for Mr. J. T. Salathiel. Mr. S. J. Williams, Architect, 23, Montague-terrace, Aberdare:—  
 Evans Bros. ... £4,420 0 0  
 Griffiths and Co. ... 4,173 14 4  
 John Lees ... 3,700 0 0

 Painting.—E. Whitehead and Co., Soverby Bridge

STONEHAVEN.—Accepted for additions to Episcopal Schools, Stonehaven, N.B. Mr. J. Augustus Soutar, Architect, 42, Union-street, Aberdeen. Quantities by Architect:—  
 Maitland.—W. Smith and Co., Stonehaven £203 15 0  
 Corporation.—R. Mitchell & Son, Stonehaven 130 3 0  
 Plastering.—A. Cornack, Stonehaven 32 6 11  
 Painting and Glazing.—Barron and Son, Aberdeen 14 18 0  
 Slating.—C. Maitland, Aberdeen 27 17 8  
 Plastering.—E. Pirnie, Stonehaven 27 10 0  
 Slating ... 48 18 0  
 £538 8 7

TWERTON-ON-AVON.—For erecting a school, for the School Board. Messrs. Silecock and Reay, Architects, Bath:—  
 W. Cowlin and Sons ... £5,500 J. Long & Sons, Bath\* £7,665  
 Hayward and Wootter ... 7,500  
 \* Accepted.

WALLINGTON.—For the erection of a pair of cottages in Taylor-road, for Mr. G. Rogers. Mr. C. E. Salmon, Architect:—  
 F. J. Barnard ... £204 W. Brown ... £417  
 Howe and White ... 89 H. Clark accepted 745

WARRINGTON.—For the erection of two houses, &c., Oxford-lane, for Messrs. J. and T. Edwards. Mr. L. O. Williams, Architect, 10, Victoria-street, Liverpool:—  
 F. W. Winst, contractor, Latchford amended quantities £570

WESTCLIFF-ON-SEA.—For the erection of superstructure of "Queen's Hotel," for Mr. Wazstaff. Mr. James Thompson, Architect, Bank-chambers, Strand:—  
 R. Gosh ... £2,054 15 3 F. Dunsen ... £20,000 0 0  
 E. West ... 21,000 0 0 Davis & Leancy 20,724 0 0  
 T. Mitchell ... 21,000 0 0 A. E. Symes ... 20,000 0 0  
 Paterson and Sons 21,000 0 0 Stratford\* 20,000 0 0  
 Jones and Sons 21,000 0 0  
 \* Accepted.

WEST HAM.—For making-up, paving, &c., Balmoral-road and five other roads, for the Town Council. Mr. Lewis Ansell, Borough Engineer, Town Hall, Stratford, E.:—  
 T. Adams ... £2,008 0 2 J. Jackson, Plaistead ... £1,735 15 3  
 W. Griffiths ... 1,875 5 5  
 \* Accepted.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by Correspondence. No books are required. For particulars and testimonials apply CERTIFIED COACH, 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION.—personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library, Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

## McNEILL'S FELTS (Roofing, Inodorous, Sarking, Dry Hair, Damp Course, etc.) McNEILL'S SLAG WOOL (Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

Lists, Samples, and full particulars free on application to

F. McNEILL & CO., Head Office, Bunhill Row, London, E.C.; Slag Wool Works Kirkintilloch, near Glasgow.

## THE SUNBURY LINCRUSTA-WALTON. WALL DECORATION.

NOVELTIES for 1897—DADOES, FRILLINGS and CEILINGS at 1s. a yard, 2lin. wide.

CHEAP DECORATIONS, DELICATE COLOURINGS, supplied by all Decorators, Furnishers, or Builders in the United Kingdom.

LINCRUSTA WALTON, tested and triumphant, "King of Wall Hangings," the only Wall Decoration on the Market.

SOLID in colour, SOLID in relief, and SOLID in value.

Write for Price List, Illustrations of "JUBILEE" and "NATIONAL EMBLEMS," &c., to

testimonials), stating age, present occupation, and past experience, written on the application form, must be addressed to me, and endorsed "Assistant County Surveyor," and delivered at The Castle, Winchester, on or before MONDAY, JUNE 14th, 1897.

The Candidate elected will be required to enter upon his duties on SEPTEMBER 1st, 1897.

Personal canvassing is prohibited.

The Castle, Winchester, H. BARBER,  
May 17th, 1897. Clerk of the Council.

**CITY of SHEFFIELD.**

The Highway and Sewerage Committee require the SERVICES of a competent BUILDING INSPECTOR in the City Surveyor's Office.

The salary will be £120 per annum.

Particulars of duties can be obtained on application to the City Surveyor, Mr. C. F. WIKE, C.E.

Personal canvassing is prohibited.

Applications, accompanied by testimonials and addressed to the Chairman of the Highway Committee, are to be sent to the City Surveyor's Office, Town Hall, not later than FRIDAY, JUNE 4th, 1897.

Preference will be given to those candidates who have passed the examination of the Incorporated Association of Municipal and County Engineers.

By order,

H. BRAMLEY,

Town Clerk's Office, Sheffield,

May 19th, 1897.

**BARKING TOWN URBAN DISTRICT COUNCIL.**

An ASSISTANT REQUIRED in the Surveyor's Department to act as Time and Storeskeeper, and Accounts Clerk. Applicants must have had similar experience.

Salary £100 a year, increasing by annual increments of £10 to a maximum of £120 per annum.

The person appointed must be between the ages of 25 and 40 years, and will be required to reside in the district and devote his whole time to the duties of the office. Applications, with copies of not more than three recent testimonials, must be sent in to the undersigned on or before MONDAY, MAY 31st.

Definition of duties can be obtained upon application to me.

Public Offices,  
Barking, Essex.E. H. LISTER,  
Clerk to the Council.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

(Continued from page 1.)

By ALEXANDER DREW.

No. V. OF SERIES.

WE have now seen how the scantlings, or section of the simple struts and ties can be determined, but in turning to the case of compound members, as they may be called, or members which have to resist bending as well as tension or compression, the matter is found to be more complicated, and demands very different treatment. Here the question of Bending Moments and Resistance Moments must be introduced, and it may be well to consider these for a little. If we imagine the case of a wooden beam resting horizontally on supports placed at either end, and any load be applied in the centre of the beam, the tendency of this load will be to bend it downwards in the centre. The amount of bending, or the value of this bending tendency, will depend on the value of the load, and also on the manner in which the load is applied; when this is a single load and placed in the centre of the span, it exercises a greater bending tendency than if it were applied at any other point, or than if it were more or less distributed over some length of the beam. Fig. 27 shows three variations of this loading, and one of these, or a combination of two, will meet almost any variation likely to be required. The three variations are marked (a), (b), and (c), and alongside each is noted the simple formula by which the maximum bending tendency for that particular loading can be at once determined; any combination of these will simply mean the addition of the separate maximum Bending Moments to get at the total required.

Returning to a consideration of the wooden beam first noted; when a moderate load is applied, say at the centre, it is found that the beam yields to a certain extent, and if the load be removed, it recovers itself at once. The resistance which this beam offers to being bent is due to the Resistance Moment which is called into play by the application of the load, and we must now turn our attention to its value, and to some means of calculating this. Fig. 28 represents a very simple form of beam or cantilever, supporting a single load W, and an examination of the condition of affairs in this case will probably help to explain what is meant by Bending and Resistance Moments. Let this beam be assumed as connected to the wall by two spikes, marked A and B, at the upper and lower edges only; the depth over all being represented by D; the distance from the centre of the beam to the outer edges by y and x, and the total length from wall to centre of weight by L. For purposes of calcu-

lation this beam may be considered as consisting of a strong rod with a short tee end, as represented in heavy lines on the diagram; and taking moments about the point O, midway between the spikes A and B, the moment of the weight about this point will be equal to  $W \times L$ .

This value then is the Bending Moment of the weight W, and L being the full length of the beam, this is the maximum Bending

spikes only as above assumed, will be kept the full section throughout. Here complications are introduced, and a full explanation would require more time and space than can possibly be allowed to it at this time; a brief description will be attempted, but the student is referred to some of the numerous theoretical text-books which treat this point fully. Keeping the condition shown in Fig. 28 in view, it will be readily perceived that should

Fig. 27. - Loading. -

- Bending Moment (B.M.) -  
(maximum)

$$= \frac{W \times a \times b}{L} \dots (x)$$

$$= \frac{WL}{4} \dots (y)$$

$$= \frac{WL}{8} \dots (z)$$

Moment. The tendency of the weight W is to draw out the upper spike A, and press the lower one B further into the wall; or it may be said that the weight is supported by reason of a certain tension and compression resistance exerted by the upper and lower spikes respectively. In a simple case of this kind the resistance offered by these spikes can be readily calculated by taking moments about the point O, for we have already seen at Fig. 14 that where equilibrium occurs, the sum of the moments must be equal to one another; so that the moment of the stresses in the spikes about this point O must be equal to, and of opposite

another pair of spikes be introduced half way between the points A B and the centre point O, these will to a considerable extent assist the outer spikes to resist the Bending Moment of the weight W; and of course should a further number of spikes be added, they in their turn will also assist. In no case will any of these have so great an effect, or be strained to such an extent as the two original outer spikes; in fact, the stress or strain on any spike will be proportionate to its distance from the centre, at which point no strain such as we are considering will occur at all. Thus the real condition of affairs may be best imagined by

Fig. 28.

value to the Bending Moment due to the weight W. Thus if the stress on the spikes A and B be represented by F and f, the moment of each of these about O would be equal to  $F \times x$  and  $f \times y$ , and the equation for a simple case of this kind becomes

$$WL = (F \times y) + (f \times x) \dots (6)$$

But a simple case such as that just noted will seldom if ever occur in practice, where the beam instead of being connected by two

considering the whole section of the beam at the wall to consist of an innumerable number of these imaginary spikes, each being strained to a greater or less extent, and so helping to resist the Bending Moment due to the weight W. Where the section of the beam is symmetrical, and the material is such that its tensile and compressive elasticity may be practically assumed as equal to one another (this latter condition is generally assumed as

\* A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the Builders' Journal.

directly the case for steel or wrought iron), the neutral axis occurs at the centre of the depth; the tension and compression strains begin on either side of this imaginary line, and gradually increasing to a maximum at the outer edges.

To accurately determine the total Resistance Moment for such a beam as is now being examined, it would be necessary to consider the section at the wall as consisting of an innumerable number of these imaginary spikes, to calculate the stress of each of these as has just been indicated by equation (6), and add all these values together. Such a calculation would be extremely tedious, even to arrive at an approximate result, if gone about in this detailed manner; but by making use of a certain mathematical value called the "Moment of Inertia," the calculations for most practical sections are considerably simplified.

Taking the section of the beam as rectangular, the neutral axis (or axis where no strain occurs) would be represented by a straight line drawn horizontally through the centre of the section; if now this section be assumed as divided up into a number of small rectangles, and the area of each of these little rectangles be multiplied by the square of its perpendicular distance from this neutral axis, and all these values added together, the result will be a certain number, which will be more or less proportionate to the total stress which takes place when a beam of that section is bent. The smaller these rectangles are taken the more approximate will be the result, and if it were possible to take each of these little rectangles as infinitely small, an accurate result would be arrived at. By the use of higher mathematics, a simple formula has been arrived at for many of the simpler sections met with in practice, by means of which this accurate

allowable, the section of the beam must either be increased, or the load diminished to keep this value within its correct limit.

Fig. 29 indicates the manner in which the rafter of a roof truss would tend to yield under such intermediate loadings as are being now considered. Referring to the several skeleton outlines shown in Fig. 26, the rafter in No. 1 would yield in the manner shown at A; that is to say, assuming, as is very likely to be the case in practice, that the rafter at apex and shoe is more or less free to turn, the curve may be assumed to be roughly that of an arc of a circle. In such trusses as sketched in Nos. 2 and 3, where the rafter would be in one length, the curve assumed would be somewhat as shown at B; here it will be noticed that at the centre support the rafter is bent in the opposite direction to that near the outer supports, and the whole length is thus thrown into three curves, the outer portions being bent downwards, while the centre portion is bent in an upward direction. This being so, it will be readily seen that the strains throughout such a rafter must vary considerably; for a considerable distance from either end the upper portion is in compression, while the lower portion is in tension; but for some distance on either side of the centre the bar is strained in the reverse manner, that is to say, the upper portion is in tension, while the lower is in compression. There is necessarily some point between the centre support and each end where these opposite strains meet and change sign or condition, these points are generally known as the *points of contrary flexure* (change in direction of bending). Here the Bending Moment is zero, but increases steadily on either side of this point, reaching a maximum for the whole bar over the centre support. Could these zero points be accurately determined, the calculation for the maximum

fectly straight, and the supports rigid; any deviation from this, or yielding in the points of support, very materially altering these figures; and as it is most unlikely that this exact condition will be met with in practice, where the rafter is often by no means accurately straight, and the points of supports are sure to yield to a greater or less extent under these loadings, these considerations cannot be accurately applied.

If the distance between the supports at A be the same as that between each support at B, or at C, and the same load per bay be assumed in each case, it will be found that the maximum Bending Moment, which occurs in the centre of the span at A, will be roughly equal to the maximum Bending Moment at B or C, which occurs in these latter cases over the intermediate supports, so that for *practical purposes it is sufficient to consider the rafter as jointed over each support, and calculate the maximum Bending Moment under such conditions, treating this value as the maximum possible Bending Moment for the actual rafter*; this calculation would, of course, be gone about in the manner indicated in Fig. 27.

(To be continued.)

KELSO has been much exercised of late over the proposed new water supply from Heatherhope, in the Cheviots, by gravitation. The scheme, for which the Local Government Board has been pressing, was brought forward some five years ago; and at a recent meeting of the Commissioners it was moved that the time had now come for proceeding with the works, the cost of which is estimated at £20,000. Mr. James Johnston, convener of the Water Committee, opposed it. Further delay was ultimately agreed on, in order that Mr. Johnson might prepare an alternative scheme for the better distribution of the present supply, and it was also agreed that fresh analyses be taken, so that, should the analyses again turn out unsatisfactory, the way would be clear for the new scheme without troubling with that for a better distribution of the present supply. The water has since been again analysed, and it has been agreed to submit all reports bearing on the matter to an expert for his advice.

At a meeting of the North-western and Midland Sanitary Inspectors' Association on Saturday, the 8th inst., Mr. W. Urquhart, the Chairman, after congratulating their former secretary (Mr. E. Worrall) upon his preferment to a more lucrative appointment, said that the past year of the society had been most successful; not the least pleasant feature had been the amalgamation of the Stafford Association with their own. The society now numbered over 200 members, and would be known in future as the North-western and Midland Sanitary Inspectors' Association. Regret was expressed that no progress had been made towards federation with the London Association, and he was afraid that so long as that body assumed the high-handed position it did there would be considerable difficulty in doing so. Sanitary science was making rapid progress, and it was absolutely necessary for the members to keep themselves up to date. Local governing bodies had largely ceased to look upon medical officers of health and sanitary inspectors who deviated in the slightest degree from the beaten track as cranks or faddists. He hoped that before long the Education Department would insist upon at least the rudiments of hygienic science being taught in every elementary school under their control, which, in his opinion, would be a much more deserving "grant-earning subject" than the glorified mud-pie making yclept "modelling in clay." The speaker next alluded to the small remuneration paid to sanitary inspectors compared with the risk and importance of the work which they had to perform, to the Scotch Public Health Bill now before Parliament, the Plumbers' Registration Bill, and to the proposed amendments in the Food and Drugs Act, and, as these measures all tended in the right direction, they must wish them success.

value can be at once got at; this is known as the "Moment of Inertia" for the cross section. If, then, the "Moment of Inertia" (or, as it is generally represented, I) be proportionate to the total stress throughout the section, and consequently to the total resistance which this section can offer to bending, this value, divided by the distance from the neutral axis to the outer edge of the section will give a number proportionate to the maximum stress occurring in that section—whether this maximum stress be tension or compression will depend on whether the distance be measured towards the compression or the tension side of the section. If this maximum distance from the neutral axis to the edge of section be represented by y, and the maximum stress which can safely be allowed per square inch for the material of which the beam is composed be represented by S, then:—

$$\text{Safe Resistance Moment} = \frac{S \times I}{y} \dots (7)$$

This Resistance Moment (R M) must be equal to the Bending Moment (B M) if equilibrium is to be maintained, so that should the section be known and (consequently the value for I and y also known) this may be equated with the Bending Moment, and the maximum stress on the beam (S) got at, as here noted:—

$$S' = \frac{B M \times y}{I} \dots \dots \dots (8)$$

It is hardly necessary to point out that if S be taken as the breaking stress in equation (7) the result will be the breaking Resistance Moment; the value of S' got by equation (8) gives the stress due to that particular condition; should it be in excess of the safe stress

Bending Moment would be comparatively simple; but unfortunately, these points are by no means fixed, and vary not only with any alteration in the manner of loading, but also with that of any variation in the section of the bar itself; and any attempt at accurate calculations on these lines would involve much more time and trouble than is likely to be given to it in practice.

There is another point that may be here noticed. Assuming the points of contrary flexure as at x x in sketch B, we may imagine the rafter to be formed to three lengths, with hinged joints at these points x x, and theoretically the bending stress would be unaltered. This being so, if it should happen that the load is distributed over the full length of the rafter, the centre support will be called upon to carry considerably more of this total load than if the rafter were made in two lengths and jointed at the centre; for the load over the centre portion will be entirely carried by the centre support, while one half of the load on each of the end portions will also be borne by the centre support; in fact, there will be, theoretically, 2/3ths of the total distributed load supported on this centre bar, the remaining 1/3ths being divided equally between the outer supports. Sketch C illustrates generally the manner in which the rafter of such a type of truss as that of No. 4 or 5, in Fig. 26, would yield under the conditions at present being considered, and the same argument will to a great extent hold good in this case, except that it may be noted that the extra load to be theoretically borne by the intermediate supports, though greater than if the rafter were joined over each support, is not now so much in excess as in the case of the two-span represented at B. These arguments, however, only hold good where the rafter was originally per-

MATERIALS AND CONSTRUCTION.

No. I.—TIMBER.

DEALING with the first part of this subject — materials — we must first see what those materials used in the building trade are, and then deal separately with each item. Principally they are timber, stone, bricks, terra-cotta, tile, slate, metals, glass, colours, oil, paint, varnish, lime, and cement. First of all, then, we have timber. That part of a tree which is used in building is the trunk and large branches. When we look at the section of a trunk or branch of a tree, we find it is composed of three parts—the bark or outer covering, the pith or core, or centre, and a woody substance lying between the pith and bark. In the woody substance there are two thicknesses; the one which envelops the pith is the greatest and hardest, and is usually called “heart wood.” The growth is in rings round the pith, which some assert are annular, each year producing one ring. Others say that two rings are produced annually; but the opinion generally accepted is that the layers are annual, and from this fact the age of a tree can be ascertained. The best time for felling trees is either in mid-winter, when the sap has ceased to flow, or in mid-summer, when the sap is temporarily expended in the production of the leaves. Trees should be stripped of their bark in the spring and felled in the winter. The kinds of timber suited to carpentry and joinery are amongst the hard woods. Oak is the strongest of the forest trees in this country. It is to be found in temperate climates, and not in either the torrid or frigid zones. There are two sorts of oak in our own country—the common and sessile-fruited. The former has its fruit upon long foot-stalks, and the other upon short stalks, or, as it is called, sessile. It grows slowly—it has been known at the age of one hundred years to be only one foot in diameter—its growth becoming less and less appreciable after the age of forty years. The chestnut next claims attention. Of it there are but two varieties in Europe. The mean diameter is 37in., and its average height is 44ft. It is very much like the oak, and is liable to be confounded with it. The elm is a large tree common to Europe. Its mean height is 44ft.; its mean diameter 32in. There are fifteen species. It is subject to attacks of worms, but it is not liable to split, and bears the driving of nails or bolts better than any other wood. When kept constantly wet it is exceedingly durable, and is much used, therefore, for keels of vessels, and for wet foundations, &c.. Its toughness also specially fits it for use in the manufacture of

naves of wheels, shells for tackle blocks, and for many uses in turnery, as it bears rough usage without splitting. The weight of a cubic foot when green is about 70lb., and when dry about 48lb. Walnut is a native of Persia, and is of great size. In this country it is grown chiefly as an ornamental tree. It is seldom used in England for works of carpentry, but it is highly esteemed by the cabinet-maker. The British walnut when young is white, and in that state is liable to attacks of worms. As it grows older it darkens, and also increases in strength and solidity. The walnut chiefly used is of two varieties found in America, and of the two, the Nigra, or brown walnut, is the most appreciated. According to Sandon, it weighs, when green, 58lb. 6oz., when dry, 46lb. 8oz.; but its weight by another authority is given at 42lb. Its strength to that of oak is as 74 to 100, its toughness 111 to 100, its stiffness 49 to 100.

THE BEECH.

The beech grows to a great size, and has only one variety in Europe. The colour varies from white to pale brown; it is now seldom used in carpentry owing to its tendency to cleave and its liability to be attacked by worms. The former is believed to be owing to injudicious felling. It is suitable for piles, weirs, sluices, flood-gates, and the timbering of embankments, being peculiarly adapted for works under water. The weight of a cubic foot when green is 65lb. 13oz.; when half dry, 56lb. 6oz.; and when dry, 51b. 3oz. Its strength, as compared with that of the oak, is 103 to 100, its stiffness 77 to 100, and its toughness 138 to 100. The ash, which we now come to consider, being hard and heavy, is little used for carpentry. It is white in colour, veined longitudinally with yellowish streaks, and, besides being liable to attacks of worms, rots rapidly when exposed either to dampness or to alterations of dryness and moisture. Its toughness and elasticity fit it for resisting sudden and heavy shocks, but it is too flexible and not sufficiently durable for carpentry. It weighs when green 64lb. 9oz., and when dry 49lb. 8oz. Its strength, as compared with oak, is 119 to 100, its stiffness 89 to 100, and its toughness 160 to 100. Teak is of very quick growth, and in colour it is of light brown. In its fresh state it is more or less impregnated with an aromatic oily substance, and to this it owes much of its value. It is largely used in carpentry and shipbuilding. The best kind is obtained from Malabar. Greenheart is a native of Guiana, where it is in great abundance. The trees square from 18in. to 24in., and can be produced from 60ft. to 70ft. long. It is adapted for all purposes where great strength and durability are re-

quired. The weight of a cubic foot is from 61.15 to 61.13. The wood of the poplar is soft, light, and generally white or pale yellow. Its principal use in construction is for floor boards, but it requires to be seasoned for at least two years before it is fit for use in this way. It is adapted for all purposes which require lightness and moderate strength, such as making large folding doors for barns. When kept dry it is tolerably durable. It weighs, when green, 58lb. 3oz. per cubic foot, and from 24lb. to 38lb. 7oz. when dry. It shrinks and cracks in drying, and loses about a quarter of its bulk. When seasoned it does not warp, and will not readily take fire. The wood of the maple is moderately hard, compact, and more or less veined, and is used in various departments of Architecture. It is durable when kept dry, and some of the finer varieties take a fine polish, and are used by cabinet-makers. The wood of the sycamore when young is white, but becomes yellow, as the tree grows older; sometimes it becomes even brown in the centre. It is liable to be attacked by worms, and its chief use is for dresser tops. The willow serves many utilitarian purposes. It is sawn into boards for flooring, and into scantling for rafters; in this capacity it has been known, when kept dry, to stand for a hundred years. Acacia is the locust-wood of America. In colour it is yellow, with brown veins. Experiments in England have shown that it is heavier, harder, stronger, more rigid, and more elastic than the best oak. It is used largely in America for sills of doors and for posts nearest the ground used in the framing of half-timbered houses. The acacia wood is difficult to get in large sizes, for, in districts where it thrives best, nine-tenths of the trunks do not exceed 1ft. in diameter and 40ft. in height. Its strength to that of oak is as 135 to 100. The horse-chestnut is white and soft, and unfit for work requiring strength and durability. Now we come to mahogany. The trunk of this tree is about 50ft. high and 12ft. in diameter. It takes probably not less than 200 years to reach maturity, and abounds the most, and is found in the greatest perfection, in the islands of the Carribbean Sea, Cuba, St. Domingo, and Porto Rico. St. Domingo yields the finest mahogany of the lot, that obtained from Cuba being next in point of quality, and Honduras third.

A PUBLIC inquiry has been held at Rawmarsh relative to an application by the Urban District Council for sanction to borrow £4500 for purposes of sewage disposal works. This is in addition to the sum of £22,320 which has been already spent.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
May 28	Celbridge, Ireland — Additions and Alterations, Workhouse	Guardians	Office of the Workhouse Master, Celbridge.

" 31 1898	Bootle—Designs for Technical School		Corporation.
Jan 30	Carlton, Victoria—Children's Hospital	£100, £50, £25	Hospital Governors, Pelham-street, Carlton, Australia.

**The Influence of Colour.** OF late years, following the lead set by medical men who started the theory of ameliorating, if not curing, certain forms of insanity by means of blue glass windows in asylums, a considerable amount of attention has been given to the psychological influence of colour, not only in our nature, but in other respects. As colour must ever be a prime factor in the thoughts of an Artist, be he painter or musician, we purpose, in the following lines, dealing somewhat briefly with the subject of the influence of colour. As there are many upon whom music has no effect, and to whom melody is an entirely lost charm, so there are many whose faculties are entirely dulled by the influence of colour, which exercises an influence which has now been developed by scientists into a well defined fact. There are many instances on record in the medical world where diseased brains have been treated with very good result by the proper and judicious employment of colour in the home surroundings of the person affected. It is not, however, with the medical side of the question of the influence of colour that we have to deal here, but rather with its general effect in the decoration of the house walls with which we are daily brought into contact. It is a fact beyond all contradiction that the influence of colour in health is not understood as it should be by the general public. It is not so long since that a writer called attention to the impropriety, not to say stupidity, of employing great expanses of depressing and cold French grey on the walls of schoolrooms and other public buildings, protesting that this tint exerted a bad and undesirable influence on the mind, and that it had not cheapness, neatness, nor cleanliness to recommend it over some half-dozen other colours that might be employed. If the public were rightly educated in the proper employment of tints, such a circumstance would be almost a matter of impossibility. As most of our readers may perhaps be aware, French white is composed of a mixture of white, Prussian blue, and vermillion, or, alternately, of white, lampblack, and Indian red, with, of course, the blue or black in the largest proportions. Blue, as the merest art or decorative Artist knows, possesses the quality known as coldness in colouring, and this is communicated in a more or less degree to all the colours with which it is compounded or surrounded, or in any way brought into connection, whether in compounding or otherwise. The complementary of the cold blue is the warm orange, which represents the maximum of heat attained by the gradually ascending series of warm tints. Midway between the cold blue and the hot orange the medium is found at purple yellow and yellowish green. Simple as the matter ought to be, when once it has been ascertained what are the colours which are hot and which are cold, to arrange suitable colourings for the interiors of buildings of any kind, it yet seems almost a matter of impossibility to impress this very wholesome and elementary fact upon the minds of the majority of our decorative Artists. A room decorated in warm or hot colours always presents a cheerful and inviting appearance, while if it is done in blue, grey, or other cold tones it appears cold and uninviting, and a person never longs to stay for any length of

time in such rooms save on a very hot, sunshiny day, when at noon or the afternoon the cool effect is inviting; and this fact has been demonstrated by experiment to be true, as great a difference as four degrees having been found in the temperature of violet and red by passing the prismatic colours slowly and gradually before a finely graduated thermometer at the bulb. Light is the natural stimulus of the healthy eye, and is more pleasing to it than any single colour, no matter what the conditions under which it is seen. It is composed of the three primary colours—yellow, red, and blue—in such finely graduated proportions as to neutralise each other. Now, experience has demonstrated that if a single colour, say red, be alone presented to the healthy eye, the organ soon

more fatigue than blue and yellow, and these again more than grey and white. Balzac, as we all know, had some curious speculations respecting colour as denoting a woman's character. He says that quarrelsome women prefer orange or green; those who wear yellow hats or don black without cause are not to be trusted; white is worn by coquettes; pink by gentle and thoughtful women; pearl grey by those who consider themselves unfortunate; and lilac by over-ripe beauties. These are only speculations, but there is really a basis of fact in them. The influence of colour is a subject which should far more engage the attention of our students in Art industries than it does at the present day, and we hope that these few lines will be of some service in that direction.

SHEFFIELD NEW TOWN HALL: CHIMNEYPiece IN MAYOR'S PARLOUR. E. W. MOUNTFORD, ARCHITECT. PHOTOGRAPH BY BEDFORD LEMERE AND CO.

experiences a very uneasy feeling—as of irritation, heat, and annoyance, when it needs to have presented to it such other colours as will neutralise its effect. This is, of course, not possible with paint, but the Art decorator can and should, produce the equivalents of the yellow and blue of the prism in green. Hence the two colours which will harmonise with red are yellow and blue, or their equivalent, green, if only one colour is admissible. Thus it will be seen that the primary colours would be very suitable in sick wards if only they were properly employed. The cool greens and greys are restful, but they are likewise wearying and monotonous, as all flat colourings are apt to prove. M. Kolbe, a Russian doctor, writing on this subject of the influence of colour, states that red and green produce

#### The late Mr. Charles James Phipps.

DEATH has just deprived theatre Architecture of one of its best-known exponents. The late Mr. Charles James Phipps, during a life extending over sixty-two years, erected many monuments, both in London and the provinces, which will serve to perpetuate his memory. For a period of over forty years he followed his Profession with credit and distinction, and the news of his death, which occurred a few days ago, will be received with widespread regret. It is theatre Architecture which has principally claimed Mr. Phipps' professional time and skill, and a melancholy interest centres in the fact that what is perhaps the greatest achievement of his busy life has only been accomplished at its close. Born at Bath in the

year 1835, Mr. Phipps was articled to Messrs. Wilson and Fuller of that city. He remained with them until 1857, when he commenced to practise on his own account, his first important work being the rebuilding of Bath Theatre in 1862, after its destruction by fire. He gained the commission in a competition, which, seemingly, had a most important bearing on his future career, for from this by no means humble start he rapidly came to the front in the practice of Architecture as exemplified in our theatres. Her Majesty's Theatre in the Haymarket is, no doubt, his largest work. Among his other works in London may be mentioned the Carlton Hotel, adjoining Her Majesty's Theatre, and still in course of erection from his plans; the Lyric Club and Prince of Wales's Theatre in Coventry Street, the Gaiety, Savoy, Comedy, Shaftesbury, Princess's, the Queen's (Long Acre), the Vaudeville, Strand, Sadler's Wells, and the Variety (Hoxton) Theatres; and the Queen's Hall (conjointly with Mr. Knightly). The most prominent of his work in the provinces includes the Royal and Lyceum Theatres in Edinburgh, and theatres at Dublin, Belfast, Cork, Londonderry, Bristol, Plymouth, Exeter, Northampton, Nottingham, Worcester (two), Liverpool, Swansea, Torquay, Leicester, Portsmouth (two), Brighton, Eastbourne, South Shields, Leamington, &c. And it is amongst this work in the provinces that, generally, Mr. Phipps' best designs are met with, as, owing to advantages of sites offered by the provincial towns, he was able to erect more imposing buildings and show their Architecture to better effect. The deceased held the appointment of Architect to the Company of Proprietors, Drury Lane Theatre, and was a Fellow of the Royal Institute of British Architects, having joined as an Associate in 1860. He took a warm interest in the welfare of the Institute, and on more than one occasion read papers at its ordinary meetings. We understand Mr. Blomfield Jackson, who has been in partnership with the deceased, and has been associated with him in his more recent works, will carry on the practice.

#### NEW GOVERNMENT OFFICES SCHEME.

THE Committee on Government Offices (Appropriation of Sites) held its first sitting under the presidency of Mr. Akcr.-Douglas, the First Commissioner of Works, on the 26th ult.—The Right Hon. G. Shaw Lefevre, a former First Commissioner of Works, said he approved of the scheme for erecting public offices in Parliament Street and widening that thoroughfare for the purpose, and of taking all the property up to Delahay Street and in Great George Street up to the new buildings of the Institution of Civil Engineers. He had propounded a similar scheme in 1881 before suggesting the Spring Gardens scheme. The Cabinet of that day had not assented to the plan, partly because of the cost of the site and partly because it was considered inexpedient for the Government to monopolise property near the Houses of Parliament. It was only when this scheme had been rejected that he had proposed a plan for taking the Spring Gardens site for both the Admiralty and the War Office. He also approved of the scheme for erecting a new War Office on the Carrington House site, and considered it to be of the utmost importance that the War Office should be in as close contiguity as possible to the Admiralty. In the scheme of 1882 it was proposed that both the Admiralty and the War Office should be provided for on the Spring Gardens site. Parliament had approved of that plan, and, as was known to the Committee, a design had been obtained by competition for carrying it out by the erection of one great building for both Departments. That scheme, however, was subsequently upset by the Committee of 1887, mainly on the ground of expense. It was thought that by main-

taining the existing Admiralty buildings, and by adding two wings to them of an inexpensive character, the Admiralty could be provided for at a moderate expense, and that the work might be completed within two or, at the utmost, three years. It was considered that a large saving in the cost of building might be thus secured. Ten years had since elapsed, only one of the wings had been completed, and instead of having been completed at a moderate cost, it was now certain that the expenditure on the two wings would amount to £340,000. He thought it was now clear that, having regard to the necessity of providing a new site for the War Office, and the long delay which had taken place, the effect of the Committee of 1887 had been to entail upon the public a loss of half a million of money. It was now too late to remedy the mistake, and the best course to be pursued would be to

of the First Lord of the Treasury. Dover House was very ill-adapted to serve as public offices, but its reception-rooms were extremely convenient for residential purposes, and the building would admirably serve as a convenient residence for the Prime Minister. This part of the scheme, however, might well wait until the other proposals were carried out. Mr. Shaw Lefevre added that the architectural effect of the new extension of the Admiralty buildings was most unfortunate. The added wing was much too low, and was wanting in dignity for such an important site. He understood also that the building was now too small to meet the wants of the Admiralty, and that in the near future additions would have to be made to it.—Mr. Scott, son of Sir Gilbert Scott, who had designed the Home Office and the India Office buildings, gave his opinion as to the different sites proposed.—Some further

erect a new War Office on the Carrington House site. He did not approve of the scheme of the Institute of Architects for widening Whitehall for the reason that, to his mind, it would be a very costly undertaking. It would necessitate the purchase both of Drummond's Bank and of the intervening houses at a very great cost. He thought that if Whitehall was to be widened at this point it should be at its eastern side. With respect to the proposals for erecting new offices next to the official residences in Downing Street and extending further into St. James's Park, he deprecated any further curtailment of the Horse Guards' Parade. In his judgment the better course would be to pull down the official residence of the First Lord of the Treasury in Downing Street and to erect offices in its place joining the Treasury buildings. In such an event he would propose that Dover House should be devoted to the purpose of the official residence

evidence having been taken, the Committee adjourned.

PLANS have been prepared for the proposed restoration of the ancient Parish Church of St. Michael, at Shap, Westmoreland. About £1200 has been already subscribed towards the cost.

THE South Staffordshire Waterworks Company is constructing a capacious storage reservoir on the summit of Barr Beacon for the purpose of supplying the higher parts of West Bromwich, Walsall, and adjacent towns. Within the past two or three years the company has sunk new wells near Bourne Pool, and have found a good supply of water. It is proposed to pump this water into the new reservoir and lay pipes to the places mentioned. The reservoir is being constructed from the designs of Mr. H. Ashton Hill.

## AN IMPRESSION.

IN attempting to arrive at any estimate of this building, the somewhat peculiar shape of the site must be noticed, and continually borne in mind. This triangular shape of the site lends itself to many beautiful and characteristic treatments, and we can imagine with what enthusiasm a medieval Architect would have seized the opportunity. It is a question whether such a shape is suitable for such a building as this, but, being given, it should surely have been

what he would like to do, are not the same things as what he has been allowed to do by the force of circumstances, and that he is often hampered from the start by foolish conditions and regulations, and official ideas as to the arrangement of accommodation, which, in this case, have probably had some influence on the general disposition of the plan.

But we cannot help thinking that something more architectural in general conception, something more organic, might have been made of this scheme, which, though apparently most convenient and workable, is yet lacking in grasp and artistic expression.

However hampered an Architect may have been in the general arrangements of the plan,

whether it has a sufficient *raison d'être*, whether its usefulness is such as to justify its expense, and whether the money could not have been expended to greater advantage elsewhere on the building. We are inclined to think that the accommodation for a clock and a water tank, which is usually all that is to be found in these towers above the roof line, is hardly sufficient justification for their existence.

There are, however, those who think otherwise, and the feature has certainly plenty of precedent to rely on. In this case it strikes us as being made a little too much of, and the top part above the main cornice seems lacking in definite form and outline. In the view which we published last week it has rather the

SHEFFIELD NEW TOWN HALL: THE MAYOR'S PARLOUR. E. W. MOUNTFORD, ARCHITECT. FROM A PHOTOGRAPH BY BEDFORD LEMERE AND CO.

frankly accepted and made the most of. One would naturally expect to see the general idea of the plan of the building, and so also the disposition of the grouping, holding some definite relation to the shape of its site. It is perhaps a pity that in this instance something of the sort was not attempted.

As it is, one feels that the general idea of the plan is not one for a triangular site, but rather a plan for a rectangular one, which has had to be squeezed in on the return frontage as best could be managed, as if it would have gone further in that direction if it could. This suggests a mutilated and undignified effect, which robs the building of that unity of conception, and that appearance of being exactly appropriate to its position, which are characteristics of artistic productions. It must, of course, be taken into consideration that what an Architect might do, or even

he is usually allowed a free hand on the elevations, and in this case the Architect would probably be willing to accept the responsibility for the projecting wings on the main entrance front.

We think these features are to be regretted, as they do not truly express the plan, and do not seem sufficiently warranted by the requirements of the case, thus giving a false effect and suggesting cross walls and internal arrangements that do not exist. We cannot help thinking that they are in the wrong place, and are not required. This main entrance elevation has too much of the appearance of having been designed for its own sake, without due reference to the plan—as though it did not grow out of the necessities of the case, though in itself it is a pleasing composition.

It is always a question whether a tower is required in a building of this description,

effect of dwarfing the main front. However, this is largely a matter of personal taste.

There is much that pleases in the detail of the building, both inside and out, though some features, such as the recessed window over the main entrance, are unhappy.

In the insane rush, however, with which so much of the Architect's work has to be done, it is not to be wondered at if some of the details of so large and complicated a building occasionally get overlooked. And again, in a building which, like this one, is the outcome of a competition, arrangements get adopted and features introduced in the hurry of the moment which the designer himself, on mature consideration, would not approve of. But once there, there they have to stop, as often as not, little encouragement or opportunity being given to the Architect to recast his scheme by the light of his previous experience.

## SANITARY PLUMBERS' WORK AND SANITATION.\*

(Continued from page 236.)

By S. S. HELLYER.

IN passing over many water-closets which have been introduced during the last ten or twenty years we shall not miss much, for the majority of them are as noisy and as unsightly as some of the new motor-cars, and to the olfactory nerves are just as objectionable as the pan-closet they were meant to supersede. I propose, therefore, to confine my remarks to a few kinds, viz., the valve-closet, the "Syphonic," the "Wash-down," and the "Wash-out," but before doing so let me mention the several points which I consider

### ESSENTIAL TO A GOOD WATER-CLOSET.

1. It should hold a body of water large enough and deep enough to quite submerge the faeces.
2. It should have no parts or places in it where faecal matters could cling to or accumulate upon.
3. It should have a water-seal of at least 1½ in. for trapping off the soil-pipe.
4. It should be so constructed that the whole of its contents may be changed by a flush of two gallons of water, and its interior parts well washed.
5. And in the case of earthenware closets having their basin and trap in one piece, its connection with the soil-pipe or drains should be readily seen. Now, if we examine the general kind of "wash-out" closets, we shall see that they all more or less fail in some one or more of these important points. In the majority of such closets, if not in all of them, it will be found that the water held in the bottom of the basin is too shallow to cover the faeces, the consequence being most disagreeable. So pronounced is this, that on making an examination it is rarely necessary for a sanitarian to do more than put his head into an apartment where this kind of closet is fixed, to know that it is a "wash-out." Then in this kind of closet

### THE FLUSH OF WATER

is made to break up the faeces in the best possible way for throwing their odours into the apartment, and instead of spending its full force upon the sides of the basin and upon the trap, it is chiefly spent in clearing the bottom of the basin. There is also the evil of a large exposed surface between the weir of the basin and the water-seal of the trap, a part which will generally be found to be in a filthy state. Having dismissed the "wash-out" kind of closet, let us now see what can be said for its next of kin, the pedestal "wash-down" kind. There is a very great variety of them, with several points common to them all, and yet they differ so much in certain essential features that, like Jeremiah's figs, "the good are very good indeed, the rest are not fit for pigs." In one particular they all stand at a disadvantage with the "wash-out," viz., that their exposed surface of water is smaller. But the best of their kind may be said to pretty well embody the points required in a good general sanitary water-closet. They are to be had of many a manufacturer, each one claiming some feature or advantage not possessed by others. Several

### VARIETIES OF "SYPHONIC" CLOSETS

are now in the market, the main object with them all being to provide a larger exposed surface of water than can be given to the "wash-down" kind; but though such closets excel the "wash-down" closets in this particular, they are not so satisfactory in some other points. The majority are not so simple, nor so reliable in their action with only a two-gallon flush of water, and some of them are complicated in their supply and discharge arrangements. In testing such closets with a pailful of water emptied quickly into them, I have seen them left with a much reduced water-seal even when they have not been attached to a soil-pipe; and how they would withstand the action of syphonage when fixed in about the middle part of a stack of soil-pipes 80ft. or 100ft. high, I should hardly like to say, but I should be apprehensive of the result. I

know of an instance where a syphonic closet was put into use during the time its soil-pipe was

### UNDER A SMOKE TEST,

and the smoke escaped through it into the water-closet apartment. But, perhaps, this is hardly to be wondered at, for, under certain conditions, the contents of the closets are syphoned out very vigorously, so much so that the water-seal of the trap would often be broken in the action. The emptying of a pailful of slops into such closets not only syphons out their previous contents, but the added slops as well, leaving the basins practically empty, in which state they would at times be used. No doubt the servants would not always remember to pull the flushing handle after emptying the slops, especially as there would be no necessity to do so to get rid of the slops. Then, unlike a valve-closet, the water held in the basin is in continuous contact with the air in the soil-pipe, but this is the same in "wash-down" closets. Then, I think, when the water is limited to two gallons it is important that the whole of such a flush should be utilised for washing down the walls of the basin and cleansing the trap; but in the majority of the syphonic closets it will be found that part of the flush is used for starting the syphon in a compartment outside the basin. Then a close examination of the majority of such closets when in action will show that

### THEIR SIDES ARE NOT PROPERLY RINSED,

and that in consequence particles of matter are left adhering to the surfaces, and that even some of the rinsed water is returned back into the closet when the syphonic action has been broken. But, of course, a second flush would make this all right. It is better that such closets should have a flush of not less than about three gallons. Before I pass away from the classes of water-closets which may, and which often are, connected to soil-pipes and drains by imperfect joints, I should like to say, as strongly as I can, that no closet or trap having a breakable outlet, such as earthenware, should be connected to a soil-pipe or drain in a manner that will not admit of a ready inspection. I now come naturally enough to valve-closets, the prince of water-closets for private use, and for places where such a convenience is not used for several days together, and when the supply of water is not limited to two gallons. The "Bramah" valve-closet was invented by Joseph Bramah, of London, in 1778, but it has been much improved upon since then, especially during the last ten or twenty years. In turning out some drawers recently, I came across a printed circular of a valve-closet. It was printed by T. Bensley in about 1790, I think. His printing press was next to Dr. Johnson's house in Bolt Court. If you look at the type you will see that the long S is used, and the Caslon Foundry abandoned that form of letter in 1785. The illustration shows

### A D-TRAP UNDER THE CLOSET,

but according to the text this trap was at that time called an "Air" trap; and although they seem to have preferred that its position should be immediately under the floor of the closet, they do not seem to have been very particular about this, for, in the directions for fixing, it is specified to be "fixed under the floor of the closet, if the joists are of sufficient depth to allow it, if not it may be fixed at the bottom of the funnel-pipe." It is interesting to notice that at this time soil-pipe was called "funnel-pipe"—the name by which it is still called by some old plumbers—and, what is still more interesting, as shown by the circular, the conservatism of that day was very strong, for they stored the sewage in cesspools built at the bottom of funnel-pipes inside their houses. But they saw a danger in this, unless matters were well suppressed, for the specification states that "great care must be taken to make properly good round the bottom of the funnel-pipe where it enters the drain or cesspool so as to entirely prevent the foul air from being emitted." There is nothing said about the ventilation of the soil-pipe, or of the cesspool; the authorities were content to "bottle up" such matters, and there was wisdom in this

with so much storage of sewage in closet trap and cesspool. But I must return to my subject. I have called

### THE BEST KIND OF VALVE-CLOSETS

the prince of water-closets, and I have done so because I know of no other which embraces so many good points. It has a larger and a deeper body of water than any other closet; whilst the valve which keeps the water in the basin enables its sides to be so extended that they are practically protected from the dejecta, no matter what state the body may be in. And to protect the flushing rim of water-closets I have recently introduced a receding rim. Then, with the attached supply valve, at the same moment of time the closet is discharged, a very vigorous flush of water is made to cleanse the whole of the interior of the closet together with its trap; and not only so, the sides of the basin are rinsed down at the same time, so that not a vestige of foreign matter may remain behind. Then the valve-closet is superior to all other closets, whether of the "wash-out," "wash-down" or "syphonic" kind, in that its basin-water—the water which is open to the apartment and the house—is separated from the water which stands in the closet-trap, in fact is "disconnected" from the water which is exposed to the air in the soil-pipe, as shown in section upon the screen, which is an illustration of a valve-closet which I have had specially made for

### FIXING UPON FIRE-PROOF FLOORS,

and places where it is desirable that the floor under the closet should remain intact. There is also another great advantage attending a good valve-closet, viz.: with an efficient lead trap under it, having a wiped, soldered joint to the lead soil-pipe, there will ever be a reliable connection with the soil-pipe, and a reliable water-seal; so reliable that the trap and its jointing may be depended upon for many generations. In the case of earthenware closets with earthenware traps in one piece—the pedestal kind—or in two pieces, it is not so; for there is not only the risk of a breakdown of the connection with the soil-pipe, but there is also the risk of the breakage of the closet itself, its trap or its basin part, which would mean a defective water-seal or no protection at all from the soil-pipe air, pending the changing of the closet for a new one. I know that some authorities have been content to fix valve-closets without a trap between the closet and the soil-pipe, but it is astonishing what may be done in the name of sanitation. Now, though something may be said in favour of fixing a valve-closet without a trap on a very short length of soil-pipe, which has its discharging end open to the air, what can be said in favour of such a closet fixed upon a long length of soil-pipe into which other valve-closets discharge with no trap to any of them? And yet scores have been so fixed. Only within the last few months I know of such cases where the closets have had to be resanitated. I will not insult you by arguing in favour of

### FIXING TRAPS UNDER WATER-CLOSETS

—that is a sound principle conceded by us all; but I shall be glad of your attention whilst I demonstrate the fact that a round pipe trap—the syphon trap, the kind often fixed in ignorance of its behaviour—under certain circumstances loses its water-seal, and for a time ceases its work of safeguarding the house from the soil-pipe, and perhaps the drain as well. It seems a waste of words to say that if a trap be necessary at all it should be of that kind which could be relied upon under any condition to which it would be liable. With a round pipe or syphon trap the discharges pass through it in so unbroken a form, and with so much momentum—gained in the fall from the closet basin—that the combined action of syphonage and momentum is not arrested in time to leave sufficient water in the trap to re-seal it. With an "Anti D-trap," as I shall show you by one or two tests, the water is just sufficiently broken up at the outlet of the trap to retard both the action of momentum and syphonage, for ensuring the retention of an efficient water-seal, no matter how small or how large a body of water may be sent

\* A paper read at the Architectural Association on the 21st May.

dispositions, and they ought not to be fixed in private houses. I was dining a month or two ago at a friend's house, and wishing to give a second flush to the closet, I waited four minutes by my watch for the flushing cistern to fill; when I left it was still filling, and I daresay by this time it is filled ready for the second flush. A properly-fitted valve-closet, with an attached supply-valve and bellows regulator, is the least noisy of all water-closets, and when it is so fitted up that the lid of the enclosure can be put down before the handle is pulled, it is practically noiseless in its action. The next slide will show a view of such a closet. It is so arranged in my house, where, for the sake of convenience and for good general flushing when necessary, the service to it is taken from the general service-pipe to other fittings. When this is properly done I do not see how any contamination can take place, but as it is most difficult to always rely upon things being properly done, it is better to separate the water-closet supply from all other services. When the cistern for this purpose would have to be fixed in the water-closet apartment it should be kept as small as practicable, holding only about half a dozen gallons of water, so that its entire contents may be frequently changed, for, notwithstanding any lid it may have, the effluvia of the apartment would gain access to the water and taint it. Where a good flush is desired, and the head of water would be under 5ft. or 6ft., the service-pipe to the closet should be of 2in. bore. If we were not influenced by fashion, or carried away by the current of things, I should wonder much why

#### PEDESTAL CLOSETS WITH NARROW RING SEATS

ever came into vogue for the best closets in private houses, especially for ladies' use. With a table-top closet basin protecting the enclosed space, and with an air-tight joint to the top of a nicely-fitted enclosure, as shown upon the screen, not only is the vapour excluded from the space inside the enclosure, but dust, and the sweepings of the apartment, as well. And with such an arrangement no cold draughts can blow upon the person using the closet. And even for the use of men, when they are feeble or advanced in years, a table-top pedestal closet affords a better means for raising themselves from the closet than the ring-seat, allowing them, as it does, a firm place to rest their hands upon. Before leaving the subject of water-closets, I ought to say something on the apartments in which they are fixed, though there is no time for more than a word or two. The apartment in itself, apart from the closet, may become an accumulator or disseminator of disease. Dark and dangerous water-closet apartments may be found with the aid of a candle in the interior parts of old mansions with no natural light or ventilation. The vapour generated in them, or escaping from the closet apparatus, may be as difficult to remove as air out of a bottle. One side of a water-closet apartment should at least stand next the external air, having a window in it reaching up to the ceiling, as was shown in two slides. Where it would be much used it should be provided with independent ventilation, should have, in fact,

#### AN AIR INLET AND AN AIR OUTLET.

It is important that the walls and ceiling should be made practically air-tight, and that there should be no places or parts about them where dust could collect and accumulate. And in public water-closets, and in water-closets which would be liable to be used as urinals, the floors should be impervious. For the best water-closets with enclosures, as just shown, and for table-top valve-closets in private houses and important positions, a floor of solid marble from wall to wall, or to a point 6in. or so beyond the sides and front of pedestal closets, is very desirable, as shown. The marble is sunk a little to catch any little leakage of the supply-valve, should such ever occur, and carry it away by an overflow pipe fixed to the floor, and discharging into the open air. Where marble cannot be afforded, the boarded floor inside the enclosure should be protected by a lead safe to which the lead trap under the valve-closet should be soldered.

I should just say here that the overflow pipe from the safe being a clean water-pipe, can be utilised for introducing a constant stream of fresh air into the apartment; but when this is done in exposed positions, the grated opening in the marble floor should be kept outside the enclosure, so that the incoming air, when frosty, may not come directly in contact with the service-pipe, service-valve, or closet-basin. I now come to

#### SOIL PIPES.

According to the bye-laws of the London County Council, under seal dated June, 1893, all soil-pipes in buildings erected after that date are to be outside. Now, although I have done, perhaps, as much as anybody to encourage the fixing of soil-pipes outside, and still prefer such pipes to be outside, I have never slavishly chained myself down to such a restriction, and I think it is a pity the bye-law should be so stringent, or that Architects and plumbers should be so hampered: for it requires no great imaginative power to conceive of circumstances where the disadvantages would be greater than the advantages. If it is a question of durability and sanitarianess, in certain cases a soil-pipe fixed inside a house would be more durable and more sanitary than if fixed outside. When they are situated on south fronts, where no shadow protects them, they often become so hot that the naked hand cannot be kept upon them; and their variation in temperature, from mid-day to midnight in the summer months, would be three times greater than upon pipes fixed inside or with a northerly aspect. The strain upon the joints of iron pipes, and the unequal expansion and contraction of lead pipe, would tell much upon their durability. And, of course, in such cases sewage matters would adhere and dry upon the soil-pipe in a different manner to that upon a pipe which did not become so heated, and it would, therefore, be less sanitary, unless, indeed, the water-closets upon it were well flushed at every usage by more than the Water Companies' restricted two gallons. Then, in certain cases, it is most difficult to find a good course for an outside pipe, free from a doorway or a pilaster, free from mouldings and enrichments; difficult to prevent it

#### DISFIGURING THE BUILDING.

Of course I am sensibly alive to the fact that such pipes may often be made to improve the elevation, but that they are always so treated I will not attempt to prove to this Association. So ugly are they at times that one fancies they must lower the value of the property on which they are fixed. I have had some photographs taken of a few such, and will show some upon the screen. They are to be seen here, there, and everywhere, in hideous fashions, being fixed neither vertically nor horizontally, nor in any pleasing line, crossing chimney breasts, coming out over stringings, cornices, roof gutters, and parapets, going up to the roof or over all the obstacles of their course victorious. Then often no attempt is taken to disguise their purpose. Branches from water-closets are brought out, and carried along on the face of the wall to the main pipe; whereas, a little alteration of the water-closet apartment, or a little shifting of the water-closet, or a little graceful bending of the main pipe, or a dexterous treatment of the branches, and they could have been brought through the wall, and soldered to the back of the pipe, where they would never be seen. Now as to

#### THE MATERIAL OF WHICH SOIL-PIPES SHOULD CONSIST.

For my own house, though I were as rich as Croesus, I should be content with lead pipe, and I should prefer it to any other kind of pipe that I know of. I should be satisfied that the pipe was more wholesome than iron, being more easily cleaned, and more durable, being less corrosive, and that its wiped soldered joints could be more relied upon than even the caulked lead joints of cast-iron pipe, and remembering that they are much fewer in number, there being at least two more joints with iron pipe than with lead in every closet branch. In fact, when the main pipe is of iron and the branches of lead there would be four joints to every junction, as shown; for the

London County Council rightly enough require such connections to be made with a brass ferrule, as shown on the face of the external wall. But, whether the branch be of lead or iron, the joint with the iron junction should never be allowed to come into the wall. Then with iron pipe there would also be more joints on the main pipe, lead pipe being made in 10ft. or 12ft. lengths to suit circumstances, and the iron pipe as generally used in 6ft. lengths. Then the

#### CHARACTER OF LEAD PIPE

compels the plumber to connect the ends neatly and nicely together, if he is to make a well-wiped, soldered joint upon them, and with such yielding material as lead he has no difficulty in doing this, for he can bend or boss or alter either end at will, and rasp them to a great nicety; whereas, with a rigid spigot or socket end of a cast-iron pipe, what can he do when the two pipes do not come together in true correspondence in their interior surfaces, or when he has been a little out in his measurements? The pipe may be a little too long, or too short, but he cannot alter the socket, nor can he tamper with the spigot without destroying the bead or shoulder which is to keep the caulking material from getting into the interior of the pipe. Indeed, he may aggravate the case in caulking in the lead, by shifting the upper pipe away from its true bore with the lower pipe, and so leave a shoulder inside for matters to catch and collect upon. At any rate such connections often afford places for particles of filth to accumulate in, and though this may not mean much in one joint, in the aggregate—in the tens of thousands of joints—if all the soil-pipes of a large town or city were of iron, it would mean something. I mean that

#### A STACK OF IRON SOIL-PIPE

with several water-closets upon it would not be so free from smell as it would be if it were of lead with precisely similar closets and water flushing. In my house in Newcastle Street there is a stack of 4in. soldered seam lead soil-pipe which was fixed more than a century ago, and I see no reason why it should not last as long again. It is made of cast sheet lead about 1/4in. thick, and for you to see its present condition I have had two pieces cut out of its lower part and photographed. The piece showing its exterior is splashed over with the many whitewashings given to the cellar during the century, but, as you see, the pipe is quite sound and good, and fairly clean in its interior, as shown by the other piece. A Bramah closet, similar to the one shown earlier in the evening, discharged into it on the second floor, and was, I expect, in daily use for three-quarters of a century, when it was changed, together with its D-trap, for a "Vortex" closet, since when it has only been in use six days out of seven. It is interesting to know that the apartment, though well lighted, has only a borrowed light, viz., through a glazed fan-light and semi-glazed door, both of which open into the staircase for access and ventilation, just under a well ventilated lantern light. But we all know how well lead pipe stands

#### THE LONDON ATMOSPHERE.

A lead R. W. head and pipe, fixed on the old dining-hall of Staple Inn in 1655, and also another head and stack, fixed on the chambers in the same Inn in 1729, are both in very good condition to-day. To prevent sagging and "telescoping," lead soil-pipes should be well supported about every 5ft. with a pair of tacks, and the strength of the pipe should be equal to sheet lead weighing 8lb. to the superficial foot. For every unsound soldered joint on lead soil-pipe, I should expect to find a thousand unsound cement joints in cast-iron pipe, and even when a joint is made with great care in iron pipe, after a time it is liable to breakage by the expansion and contraction of the pipes as shown. The pipe generally used is of insufficient strength, and is liable to fracture like that shown, which also shows a defective joint with its fellow pipe and with that of the drain. But I have no desire to unfairly decry iron soil-pipe, especially when such pipes are of good strength (1/4in. metal for outside situations), and the joints are well and carefully

made with blue lead or Spence's metal. In fact, where hot water is discharged into a soil-pipe, lead pipe with soldered joints would not stand the continual

#### STRAIN OF EXPANSION AND CONTRACTION;

and, therefore, iron pipe would be much preferable in such cases. But, in my opinion, hot water ought never to be discharged into soil-pipes, their temperature should never be so raised. I know well enough that in America not only are the baths and lavatories discharged into soil-pipes, but also the sinks; but we can afford to treat plumbers' work more sanitarily. We can carry the waste-pipes from such fittings through the open air and discharge them into intercepting traps, for we are not subject to such severe frosts. All soil-pipes, no matter of what material they are made, should be carried up at least full-bore to the highest parts of the roof, where the air coming out of them would have no chance of getting into the house, and where the wind from any point would blow over them to carry the bad air away. I think it is only right to say that this matter is now much more considered by the authorities than used to be the case, but I am going to show you directly a few instances of bad treatment where the pipes have been recently fixed, some even this year. It will readily be seen how the emanations of soil-pipes and drain ventilation pipes can contaminate the cistern water or enter a house through its windows or chimneys; and how, even though the people of one house may be friendly and neighbourly enough on the lower part of their houses, they are not really so in the upper part, the

#### AIR FROM THE SOIL-PIPE

of one house being allowed to enter the window of the other house, and poisoning the air within, as shown in the illustration. Now, as to the size of a soil-pipe. Before determining the size of the pipe, it is important to know what it has to do. If in addition to its work of carrying away the discharges of a tier of water-closets, it has also to act as a ventilator to the drain, it ought not to be less than 4in. And if no syphonic action is to take place in it, that is, if no anti-syphonage pipe is fixed to its trapped branches, it should be of larger bore still—5in. or 6in. pipe. And even this size would not be large enough to prevent syphonage when the air had to come down a long length of piping, as in the case of a very high building, unless its upper part—the ventilation pipe—was of a bore still larger, for the air to pass down the pipe free from friction, and in a body sufficiently large to prevent a vacuum. When no anti-syphonage-pipe is fixed, and the main soil-pipe is only 3½in. or 4in. bore, it is of paramount importance that only water-closets which have special traps should be fixed, which means a deeper seal and a larger body of water. Now, except in the case of valve-closets, as we have already seen, the water-seal of a closet is in open contact with the air in the soil-pipe and the drain; and where the closet is not in constant use the water held in its trap would become tainted and surcharged with gases. It is, therefore, important that the whole of this water should be changed every time the closet is used, and I confess that I do not see how this is to be done satisfactorily with a two-gallon flush, if the water-seal of the closet-trap is to be of a depth great enough to withstand

#### THE ACTION OF SYPHONAGE

without the aid of an anti-syphonage-pipe, and the closet is to be left with its full water-seal. Moreover, without anti-syphonage pipes there would be no ventilation of the closet branches, no matter how long they might be. In fact, such branches would be like inverted bottles, for there would be no escape for the gases in them, except by diffusion or by passing through the water-seals of the closet to the house. To show the power of such pent up gases I have had a lantern-slide made of a photograph which I had taken the other day of the interior part of a piece of lead-pipe which was branched into a stack of soil-pipe about fifteen years ago. The lower half, which carried off the matters sent into it, is practically

intact; but the upper half, the part exposed to the gases and vapour, is eaten through in many places. The main soil-pipe on which it was fixed was open full bore to the air about 50ft. above it, and for a few years it was trapped off from an old drain with which it was connected, when it was re-connected without a trap to a system of drains which had several other open soil-pipes upon it for ventilation. The piece of lead water main is quite perfect, though it is supposed to have been in use at Hampton Court Palace over 350 years. It will be found with an anti-syphonage pipe of 2in. bore that a 3½in. or 4in. soil-pipe will answer very well for a tier of many closets, except in the case of very high buildings. And, as the London County Council allow nothing smaller than 3½in., and require 4in. when it is connected with a 4in. drain, I say nothing about smaller sizes. I have no time to add much to what has already been said or implied on ventilation. The ocean of air surrounding every house ought not to make it too difficult to give

#### FULL AND FREE VENTILATION

to every soil-pipe, waste-pipe, and drain; and in such a manner that no air coming out of either outlet or inlet of the system should enter the house or be breathed before it has been well broken up and purified. When many stacks of soil-pipe are directly connected to one large system of drains, having only one low-level inlet upon it, viz., at its "disconnection chamber" with the sewer, the several stacks will not have such currents of air in them as they would if each drain into which each stack discharged had its own independent inlet, especially when all the stacks are of equal height, and the air in them is about equipoised, though there is generally some different influence acting on one pipe more than another, difference of temperature, wind, or weather. When no such influence exists the vapour will at times go up and down the pipes for hours together in a sort of see-saw movement. Backwards and forwards in the dark drains the injurious microbes may move, playing a sort of hide-and-seek; for I know little of their behaviour and less of their habits, except that I believe that light is not conducive to their longevity, and that fresh air annihilates them. But I must mind what I say, for we are all not made up of microbes? So I say no more on ventilation, except to remind you that, like money, there can rarely be too much of it where it is most needed. I have had some photographs taken of badly positioned

#### VENTILATING TERMINALS

from soil-pipes and drains, and will show them upon the screen, pouring their emanations into windows, cisterns, chimneys, &c. The bye-laws of certain district councils require that the waste-pipe from every bath, sink, or lavatory, the overflow-pipe from any cistern and from every safe under any bath or water-closet, and every pipe for carrying off waste water, shall be taken through an external wall, and discharge in the open air over a channel leading to a trapped gully-grating at least 18in. distant; that is, such authorities prefer insanitary methods to sanitary ones; for such treatment is sure to lead to a nuisance in some such way, as shown by the slides taken from two original photographs. Soap-suds and bits of soap will generally be found decomposing and throwing off bad air, and often bits of paper, orange peel, hair, and the like, will also be there, blocking up the grating, offending the eye, and needing almost daily attention to keep clean. The ground, too, surrounding such gullies will often be found to be quite sodden with splashings and overflows. Whereas, with such waste-pipes made to discharge into self-cleansing intercepting traps just under the grating, no mess would be made, and no attention needed to keep the surroundings clean. And when such waste-pipes were properly trapped and ventilated their air disconnection would be all that could be desired. I will show the two methods. No doubt some years ago there was a reason for keeping the

#### DISCHARGING ENDS OF WASTE-PIPES

well above a gully when the latter was generally a little cesspool in itself, and when waste-pipes

were often fixed without traps, in which condition they acted as ventilators to the house. But no such reason exists now that self-cleansing intercepting traps are generally fixed, and that the waste-pipes are trapped. And yet only the other day a Board Surveyor, against his own judgment, caused some waste-pipes to be altered, because they delivered under the grating of a drain-interceptor, instead of over it; that, too, notwithstanding the fact that each waste-pipe was trapped. A soil-pipe may discharge directly into a drain, which may have no air disconnection within several hundred feet of the soil-pipe, although there be but the water-seal of the closet-trap between the drain and the house; but for a waste-pipe to have its air disconnection under a grating—oh, blissful ignorance! No sink, bath, lavatory, or other fixture through which dirty water may be emptied should be fixed without a trap of a self-cleansing kind, and one that will, when properly ventilated, retain an efficient seal, no matter how large the body of water may be which is sent through it. And to prevent the discharges of one fixture backwashing up into the waste-pipe of another and fouling it, each fixture should have its own separate trap, which should be situated as close to it as practicable, so that the piece of outlet pipe—standing between the house and the seal of the trap—may be as short as possible. A good example of the very reverse of this is a 9in. D, with no less than seven waste-pipes connected with it. Less than a year ago it was doing duty in one of the greatest University Colleges of the country, receiving as it did the waste-pipe from a cistern, a bath, a drip-sink, a lavatory, a bath safe, and other pipes. As only a very short length of unventilated waste-pipe is

#### SUFFICIENT TO CAUSE SYPHONAGE,

the upper ends of such pipes as well as their discharging ends should be carried through the external walls to the open air. To show how small a fall suffices for this, I have here a little lavatory with 1½in. syphon tap and a short length of 1½in. waste-pipe, with its discharging end standing only a little below the bottom of the lavatory trap, and yet the drop is sufficient to set up syphonage and to leave the trap practically unsealed with but a small discharge from the basin. I was staying at an hotel in Germany last year, and noticing a horrible smell in a lavatory more than once, I searched out its cause, and found that the lavatory trap was most easily syphoned, in a similar manner to that just demonstrated; for although it was connected with a soil-pipe, the latter was about 7in. bore, and could not, therefore, have caused the syphonage. It arose from its own unventilated waste-pipe. Opening up the upper end of a waste-pipe to the air not only prevents syphonage, it also ventilates the pipe and keeps it wholesome. Where more than one trap is connected to a waste-pipe through which quick discharges may pass, it is not sufficient for the upper end of the main-pipe to be carried through full bore to the open air to prevent syphonage; each individual trap must be ventilated—must have an anti-syphonage pipe in fact. I think most authorities are now alive to the value of providing

#### QUICK DISCHARGING ARRANGEMENTS

to baths, sinks, and lavatories, though only the other day I came across a small wash-hand basin which took nearly one minute to empty. A 5ft. 6in. bath ought to empty under two minutes, and where it would be in daily use, and was situated near the head of the drain, as the chief means of flushing it, it might be made to empty in one minute, a 3in. waste-valve being fixed to the bath for the purpose, and the trap and waste-pipe of equal bore. When circumstances require a soil-drain to be fixed inside a house, or outside it, where a leakage from it would find its way into the house or under the footings, I should strongly prefer it to be of cast-iron, with caulked lead joints, rather than of stoneware—whatever kind of joint might be adopted—the thickness of the cast-iron pipe being not less than ¾in. in its thinnest part for 4in. or 5in. drains, and greater still for drains of larger size.

(To be continued.)

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
June 2nd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AN Exhibition suggested by the deplorable disaster in Paris was opened on Monday at St. James's Hall. It was organised by the United Asbestos Co., Ltd., "in order," so the catalogue informs us, "to demonstrate means of assisting in the prevention of loss of life by the use of non-inflammable decorations in our homes and public buildings, instead of the highly-combustible materials generally employed." The fire-resisting qualities of the United Asbestos patent "Salamander" decorations are already well known, and all who take a practical interest in the question of fire-prevention ought certainly to visit the present Exhibition. Asbestos is shown in almost every shape and form in which it is manufactured. Specimens of the crude material from all parts of the world, Asbestos in a partial state of manufacture, Asbestos-metallic cloth as made specially for theatre curtains, with a working model of a fire-resisting drop-curtain, Asbestos ropes and ladders for fire-escapes, jackets, clothes, &c., fire and waterproof cloth blankets, Asbestos non-conducting composition for protecting iron girders and covering steam boilers and pipes, Asbestos paints, &c., are a few of the principal exhibits, and it is opportune that after such a calamity which has just saddened Paris they should be brought prominently before the public notice. And, as Mr. Cuthbert Quilter, M.P., who was one of the speakers at a luncheon given by the Asbestos Company at the St. James' Hall on Monday said, they saw the need for a means of fire prevention everywhere, whether it was at a charity bazaar in Paris, or at the Pisa Cathedral, or at the National Art Gallery. It seemed to him very strange that when fire-proof, or at any rate fire-resisting, material was so readily obtainable, people did not think it worth while to make use of such valuable inventions. Colonel Robert W. Edis, who presided at the luncheon, referred to the risk of fire incurred by the erection of highly inflammable materials in front of the National Art Gallery and other public buildings. If only from an artistic point of view, Asbestos paint might be applied with great advantage; in any case it was absurd that the authorities should permit such a needless risk of fire consuming such priceless treasures as the National Gallery contains.

A PULPIT of a very decorative kind has just been erected at the Barnet Parish Church. It is embellished with statues of the six greatest preachers which Great Britain has known. Those responsible for the pulpit have fixed these to be St. Augustine, St. Aidan, St. Hugh, Latimer, Wesley, and Canon Liddon. The figure of Wesley has a curious history; it was originally designed for a Wesleyan chapel at Upper Tooting, but the presence of an image gave such offence that it had to be dethroned.

THE London County Council has gone to extremes in consequence of the Paris fire. It has forbidden the use of velariums in the picture galleries at the Earl's Court Exhibition, and thus the pictures on the sunny side will

be exposed to a glare which owners may not contemplate with equanimity. But whilst it has done this as regards galleries which have ample means of exit, and where risk of fire from smoking, &c., does not exist, it permits awnings and draperies of all kinds in refreshment rooms, where spirits are stored and matches may be lit and thrown away.

AN immense pile of chambers and offices which has been put up on the space at the rear of Westminster Bridge Station and St. Stephen's Club, has been completed at an auspicious moment for the owners. Naturally such a huge building even in London would not be let right off. It has, however, happened that the Government requires a large number of temporary offices, in consequence of the extensive rebuilding that is to be carried on in Whitehall and the Governmental regions round about. The Government officials have taken the whole block, or nearly the whole, for the purpose of temporary public offices during the time the new offices are being built.

THE beautiful tapestries, made by Edward Leyniers, which belonged to the late Sir John Millais, have been purchased by Messrs. Duveen. Edward Leyniers was one of the most famous of the Brussels tapestry artists of the seventeenth century, and the four panels representing the four quarters of the globe, with borders, are among the finest specimens of his work. Those who are interested in tapestry and know something about it will recognise the difference between the work that was produced in Belgium down to the middle of the seventeenth century with that of a later period, when the object is rather to produce the effect of a picture than a purely decorative effect, which is the characteristic of the finest Gobelin tapestry.

A SILVER PALACE is to form the chief attraction at the Trans-Mississippi Exposition, which is to be held at Omaha in November next. As a distinctive part of the great Exposition it promises to rival the Eiffel Tower or the Ferris Wheel. The building is to be 400ft. square, surmounted with mammoth ornamental towers, and the entire structure will be covered with rolled silver. The palace will be used entirely for the display of the mineral products and progress of the West. The style of Architecture is purely Gothic, a style that lends itself readily (with its pinnacles, arches, flying buttresses, and graceful and delicate forms) to the ideas usually associated with silver art work. It will be arranged in the form of a square, with open arcades at each story similar to the Venetian palace. The corners will be adorned with octagonal towers, terminating with spires, and pinnacles covered with the shining metal. The crowning glory of the palace will be the central lantern, which is octagonal in form, 250ft. high, and 100ft. in circumference. The roof of the lantern will be of glass.

THE restoration of the Crypt and Chapter House at Canterbury Cathedral has consisted for the most part of what may be classed as "necessary repairs," though in the Chapter House the ancient decoration has been revived, as far as the roof is concerned, and a new stained-glass window inserted. The Chapter House at Canterbury is the finest example in this country of the "oblong" class of structure devoted to such a use, and although it cannot be compared for a moment with the exquisite octagonal examples at Salisbury, Wells, and York, or the decagonal one at Lincoln, it is, nevertheless, a stately apartment, and forms a striking adjunct to the noble "Metropolitan Cathedral." It is 93ft. in length by 35ft. in width, and receives light chiefly through two large Perpendicular windows in the east and west gable ends. One window is over the entrance doorway, and the other above the throne of the Archbishop, which occupies the position which would be, in a Church, taken up by the altar. Arcades with marble columns surround the building, the basement upon which they rest forming a continuous seat in two ranges. The arcading at the east end is

more elaborate, and the centre stall, or throne, is a beautiful work richly adorned with carving and patterns painted upon glass. The great window at this end has been filled with stained glass by Mr. A. O. Hemmings, the chief features of which are twenty-one large figures of Archbishops and Sovereigns who have from the earliest down to our own times been connected with the history of the Metropolitan Church of Canterbury. The roof of this apartment, which has been carefully restored, is a most elaborate work; it is covered with a kind of network of geometrical tracery, richly painted and gilt. The entrance to the Chapter House is by a large doorway at the western end communicating with the cloisters, and the view looking through this, when the doors are thrown open, is remarkably attractive as the eye wanders across the beautiful old cloister, with its rich, unglazed tracery windows, into the green garth beyond, and the vista is only closed by the western cloister-walk 120ft. away. The restorations of the Chapter House and Crypt, to which we have alluded, have been carried out under the designs and superintendence of Sir Arthur Blomfield, A.R.A.

THE Joseph Thomson Memorial is now nearly completed, and it is proposed that it should be unveiled at Thomson's native town, Thornhill, near Dumfries, on Tuesday, June 8. The memorial, which has been designed by the sculptor, Mr. Charles M'Bride, of Edinburgh, is of Classical design, and is in the form of a truncated obelisk pedestal raised on three steps into a moulded base and cornice. The four sides are panelled. One is occupied by a bas-relief representing a female figure of Fame upholding a map of Africa, with palm trees and Mount Kilima-Njaro in the background. The pedestal is further decorated with masks representing the heads of lions. The whole is surmounted by a bust in bronze of Joseph Thomson. The total cost of the memorial will be £250.

THE East London Art Exhibition recently opened at the People's Palace comprises paintings, water-colour drawings, engravings, etchings, photographs, and process work, all of which, however, have not yet been effectively hung. Among the pictures is the portrait of the late Colonel the Hon. C. Lindsay, by the Princess Louise (Marchioness of Lorne). Mr. A. F. Hills, chairman of the exhibition committee, in delivering an address explanatory of the Exhibition, said they had been able to gather together a collection of good works which would prove to be one of unique value and benefit to those in that portion of London. The Exhibition will be continued for five months.

It is curious that the Thames is the making of all the municipal bodies in London. Lord Rosebery said at the dinner on the night of the opening of the Blackwall Tunnel that the London County Council would always be remembered by its Blackwall Tunnel under the Thames. Its predecessor, the Metropolitan Board of Works, will always be remembered, we may add, by its Embankment along the Thames. The "tallest" thing ever done by the City Corporation is certainly its Tower Bridge above the Thames.

THERE is a great desire among the inhabitants of Broadstairs to erect a memorial to the late Charles Dickens in the place he loved so well, and where so many of his books were written. It is proposed to make the memorial one worthy of him, and of such a character as he would have heartily approved. It has, therefore, been resolved, as one of the means of celebrating the Jubilee in Broadstairs, to hold a "Dickens" Fête during the first week of July, for the purpose of raising funds for the erection of a club and reading room for the fisherfolk, sailors, and workmen of the place. Should there be a surplus, the money will be devoted to other important local objects.

DR. COLLINS presided over a special meeting of the London County Council held last week to continue the debate on the report of the special committee on the Works Department.

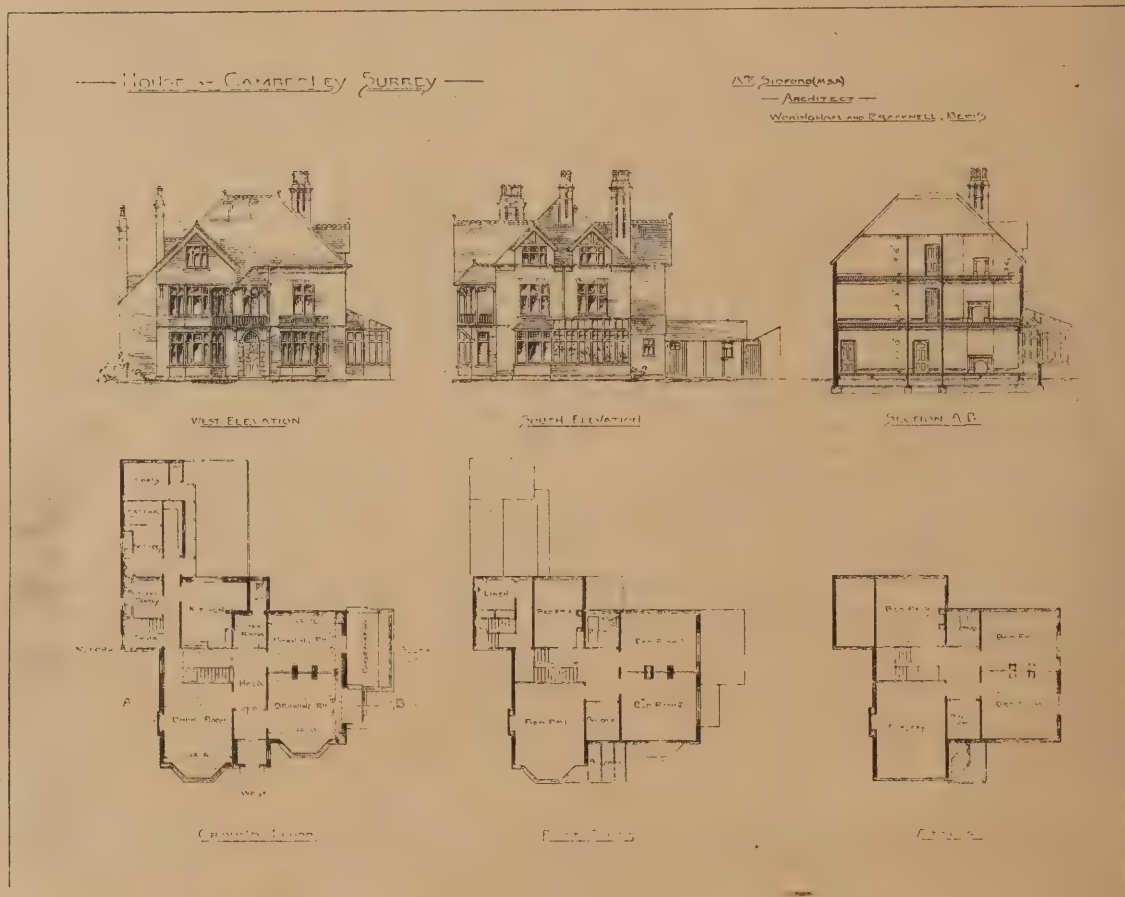

The motion before the Council was that Recommendation A of the report be carried, namely, "That, in the opinion of the Council, some definite organisation for the direct employment of labour and the direct execution of public works by the Council under the superintendence of its own officers is desirable and beneficial." To this an amendment, empowering that no further work be intrusted to the Works Department, was moved by the Earl of Onslow.—Mr. Hoare, the newly-elected chairman of the Works Committee, resumed the debate and maintained that the time had not come for the abolition of the Department.—Mr. Beachcroft characterised the Works Department as nothing more or less than a fad, for they could never compete with the best class contractors.—Colonel Legge remarked that the inception of the Works Department was a blunder, and its continuation would be a crime.—Mr. Shaw Lefevre was of opinion that it would be better to postpone the matter until after the elections in March, for it was too important a question to be settled without an appeal to the con-

ments, such as the board room, the offices, and rooms for the medical officers and students. The first floor will contain residential quarters for the matron and house surgeons, and a nurses' sitting-room of roomy dimensions. On the second floor will be the operating room, and small wards for cases of a special character; whilst the top floor will be used as a kitchen, &c., with the servants' dormitories. The whole of the ground floor of the remainder of the hospital, with the exception of the chapel, may be briefly described as devoted to the use of the out-patients, whose means of entrance and exit will be in Peerless Street. The upper floors of the remainder of the building will be used as wards, and there will be accommodation to the extent of 154 beds. Brick and Portland stone will be the materials used, and the building, when completed, will constitute a free adaptation of the Italian style of Architecture. The plans have been prepared by Messrs. Young and Hall, of Southampton Street.

THE Select Committee of the House of Com-

scheme and the present Bill, which was really only supplementing that, were practically carrying out the suggestions which the Royal Commission had made for the giving of a better water supply to the metropolis.—Mr. J. Francis, engineer to the New River Company, gave in his evidence a short account of the New River Company and its sources of supply. They could rely on a maximum of about 46½ million gallons a day in all. If the rate of increase of consumption remained the same as it had been recently, in ten years the average quantity needed would be 52,000,000 gallons daily; but since provision was to be made for the maximum demand, 65,000,000 gallons daily should be obtainable for times of maximum consumption. Under the present scheme there would be two subsiding reservoirs at Kempton Park—near the racecourse—having a total area of 45 acres and capacity to hold 219,000,000 gallons, and two filter beds, with a total area of nine acres. There would also be machinery of about 623 horse power at Kempton, whence the water would be conveyed by a main 42in. in diameter to an intermediate

stituencies.—Lieut.-Colonel Rotton thought that they should make an end of the Works Department, and each committee should engage in such works as it might think fit.—Dr. Longstaffe was of opinion that neither a Works Department nor a Works Committee would be a success, and that it would be better for the Progressives to acknowledge their failure.—Mr. Costelloe said that the attack on the Department was for the object of placing the Council again in the hands of the contractors, and then the conditions with respect to labour in the contractor's schedule would be relaxed.

THE new building of the Ophthalmic Hospital in the City Road, the foundation-stone of which was laid last week, will, when completed, present a very substantial and imposing appearance. It will comprise practically three blocks, one of which will face the City Road, and the second Peerless Street, while the third will lie between the two. The hospital will also have a small frontage in Clayton Street. The front block—that facing City Road—will consist mainly of the administrative depart-

ments, of which Mr. Rankin is chairman, has commenced consideration of the New River Company's Bill. Mr. Pope, Q.C., said that the Bill was promoted by the New River Company for the purpose practically of utilising to the full the scheme which was authorised by the Staines Reservoir Act. That Act provided that the Grand Junction, the West Middlesex, and the New River Companies should take 35,000,000 gallons daily from the Thames near Staines. The method proposed was, however, found to be impracticable, and the object of the present measure was to raise capital with which to construct works to convey the water to where the New River Company wanted it. The total cost of the works part of the scheme was put at £970,000. He should contend later on that the sinking fund clause was not applicable to the New River Company as an undertaking, and that it ought not to be applied to this particular capital. The aqueduct, which was really a closed pipe, would run underground from Kempton Park to the pumping-stations, immediately adjoining which was the New River District of supply. The Staines

reservoir at Cricklewood, 13½ miles away. Here there would be a small covered reservoir of about 2,000,000 gallons capacity; and a pumping station with power about equal to that at Kempton. Thence the water would be conveyed to Fortis Green, where would be about the same kind of works as at Kempton, and a reservoir holding about 15,000,000 gallons. There would be all necessary sluices, air valves, and works generally on the line of route. Capital powers of £1,000,000 were sought, the balance being required for works to carry the water from Fortis Green to other reservoirs, which works could be carried out under existing powers. The aqueduct struck across country from Kempton Park to Fortis Green, without following the roads, difficulties with local authorities being thus avoided. Only one portion of common land—namely, at Hounslow Heath—was involved, and there only an easement was taken.

At 118, New Bond Street, Mr. J. Hardwicke Lewis is showing a number of water-colour drawings of Alpine peaks and Swiss lakes,

together with a few figure subjects and landscape of valleys or plateaux. It is no child's play to attack the Alps for picture making. Most artists, amateur or professional, feel constrained to use much body colour in such subjects, but Mr. Lewis rarely applies it, and never when representing snow. For much of the crispness and effect of light on snow he depends on skilful use of a coarse-grained paper. The best drawings are those of quiet silvery effects and comparatively restricted area, such as lake edge embraced by mountain with iridescent haze veiling junction of land and water; or calm lakes with lateen-ailed boats in butterfly trim going before the wind.

THE Bishop of London, in the course of a sermon at St. Paul's, Knightsbridge, pointed out that we were very proud of our material civilisation, but it was nothing to that of Rome, with its splendid system of law, its great buildings, its beautiful cities, its commodities more at the disposal of everyone. If

carrying out the same. It was decided to proceed with part of the scheme, at a cost of £600, at once, so that the supply may be available during the ensuing season, and Messrs. Crossley's tender of £271 for engine and pump was accepted. The vexed question of the building bye-laws, with reference particularly to corner plots, was again discussed, and the Clerk was instructed to communicate with the Local Government Board in regard to the matter, and inquire whether they would be willing to sanction a bye-law similar to that contained in the London Building Act, 1894, which makes some allowance in the case of corner sites.

ABOUT fifty members of the Bradford Anti-quarian Society recently paid a visit to Norton Conyers, near Ripon, by the courtesy of Sir Reginald Graham, Bart. Norton Conyers is beautifully situated in an extensive and richly-wooded park, with a prospect taking in the towers of Ripon Cathedral in the foreground.

At a recent meeting of the committee appointed to arrange for the erection of a new tower for Liskeard Parish Church, a letter was read from the Chancellor of the Diocese (Mr. R. M. Paul, of Truro), in which he pointed out that "the proposed new tower appears to be totally distinct in style, design, and dimensions from the existing tower, and beyond the preservation of some small details will not hand down to posterity any general idea of what to many has been the most interesting part of Liskeard Church. Both Mr. G. H. F. Prynne and Mr. Sedding, the experts who had been called in, admit that the tower is in a very dilapidated state, and that it must be taken down; and if the committee could see their way to re-erecting the present tower and submitting fresh plans the Chancellor says he would raise no further difficulty." The committee unanimously adopted the following resolution:—"That inasmuch as no notice of opposition has been given to the petition, it is the opinion of this meeting that the Chancellor

HOUSE AT CAMBERLEY, SURREY; VIEW FROM S.W.

ARCHITECT

London ever became a desert, its ruins would be less imposing than were those of Rome, Babylon, or Nineveh. But did Dr. Creighton remember how many of the wonders of Nineveh are now themselves in London, and available therefore as ruinous assets? As Rossetti said in his fine poem, "The Burden of Nineveh," those winged bulls which attest the colossal scale of the Assyrian builders may one day pass themselves off as "ruins now of London, not of Nineveh."

At a recent meeting of the Clacton Urban District Council, the Surveyor's plan for the erection of the necessary buildings on the New Inn Yard was adopted, and it was resolved to apply to the Local Government Board for permission to borrow £1250 to cover the cost of the land and the erection of buildings thereon. It was resolved that the scheme prepared by the Surveyor for the utilisation of sea water for flushing the sewers and watering the roads be adopted, and that application be made to the Local Government Board for leave to borrow the sum of £2800 for the purpose of

The mansion is for the most part Elizabethan, and contains a large collection of portraits, mostly of the Graham family and its connections. A great feature of the interior, however, is the oak wainscoting and a rich collection of antique oak furniture. Afterwards an inspection was made of the ancient Church of St. Mary, at Wath. Mr. Sam Margerison, Calverley, said the Church underwent restoration during the time of the late rector, the Rev. W. C. Lakis, F.S.A. An extraordinary feature of the Church is that it contains examples of every style of Architecture from and including the Saxon period to the present time. The chancel is unusually long, and contains a double piscina with shafts and three sedilia with lateral openings, all Early English. Adjoining to the chancel there was an ancient sacristy of two stories, with a winding staircase in the south-west angle. A narrow hagioscope opened from the room to the altar. The south and only transept was formerly the private chapel of the Nortons, where there still remain brasses and effigies of the family.

should be asked to forward the faculty to the vicar and churchwardens at once if a faculty is necessary." It will be remembered that illustrations were given in a former issue of this Church and tower, and the fact that the tower was to be pulled down severely criticised.

A THREE-DAYS' sale of the collection of bronzes and gems of the fifteenth, sixteenth, and seventeenth centuries, Italian bronzes, pictures, plate, and other interesting and rare objects of Art formed by the late Rev. Montague Taylor, has just been concluded by Messrs. Christie, Manson, and Woods. Many of these articles have been exhibited at the South Kensington Museum Loan Exhibition in 1862, and at the Burlington Fine Arts Club. One of the most remarkable articles was a very fine Greek gold ring, circa B.C. 342-326, engraved in intaglio, with standing figure of Dione wearing stephanos, with sceptre in left hand and peplum in right—£245. This ring was found in Sicily.

SEVEN YEARS' EXCAVATING AT  
SILCHESTER.

TEN miles south-west of Reading, in the parish of Silchester, is the site of a Romano-British city identified with the Callera Attrebatum of the Antonine itineraries. A hundred acres of arable and pasture—the only extraneous buildings upon which are a farmhouse and the Parish Church—are included within the bounding wall, which is near upon two miles in circuit. This great extent alone would indicate its town-like character, and this the systematic explorations, which have been carried on since 1890, have fully confirmed by the bringing to light of public edifices, temples, forum, Christian Church, residences, shops, traces of trades, and other evidences of the former existence of a purely civil community. For the purposes of investigation the area has been ruled into squares, from which Insulae XV. and XVI. were selected for the past year's work. The results, according to custom, have been sent to the Society of Antiquaries for exhibition, and form a very interesting display. Included among them is a series of fifty-two sets of water-colour drawings, made to scale by Mr. George E. Fox, of every important

## FRAGMENT OF ARCHITECTURE

found during the seven years' period of research. One of them depicts a fragment of a colossal statue, found in the basilica, and which may have represented the guardian genius of the city, as it bears a municipal crown. Equally careful coloured drawings on reduced scales have been made of the several tessellated pavements in the largest of the five noble mansions discovered in the previous year; and one also of the corridor pavement some 40ft. long by 12ft. wide, which was laid bare in an older residence. The excavations in Insulae XV. have brought further examples of the dyers' furnaces, shops, and bleaching ground. There was also a very curious find of blade-bones of sheep, from which numbers of ring counters had been cut, seemingly by a centre-bit; and this indication of a turner's trade may in some degree account for the presence in other places of accumulations of these bones. Another interesting discovery was a tub-well, which has been successfully brought out. The well was sunk in the native soil to the depth required to reach the water supply. A square curb, formed of 6in. square oak baulks about 4ft. long, dove-tailed together, was laid on the bottom. Upon it rested a round tub or barrel 3ft. in diameter, made of fir staves 3ft. 9in. long by 5in. wide, the whole hooped with birch hoops. A second tub was stood on the top of the first, and the interspace between the tubs and the sides of the well was filled by pugged clay well rammed in. Above this the well was

## STEENED WITH FLINTS.

In emptying a pit at the south-east angle of Insula XVI. a curious cutting, 6ft. deep and 3ft. wide, tapering to 1ft. at the bottom, was disclosed and followed in both directions. On the west it went into Insula XV., and so on until it passed the city wall into the ditch outside, where it ended in some flint work. Eastwards it could not be traced beyond a few yards until after harvest, when its course was followed into Insula III., as far as a house near its southern boundary, excavated in 1891. The occurrence towards the east end of remains of iron collars at regular intervals showed that a wooden pipe had been laid in the cutting. It was also found that this pipe had ended in a building at a lower level than the house above-mentioned, and the existence of which had not even been suspected. For what purpose this pipe had been laid to bring water from the city ditch more than 700ft. away remains to be determined; possibly it was for the service of public baths. The tracing of this pipe has led to the discovery of a previously unknown gate or postern in the west wall of the city in line with a street running straight towards it. There was a single opening originally 12ft. wide, the jambs of which are standing to a height of over 6ft. The roadway has since been raised, and the gate entrance reduced to 7ft. wide by blocking

with masonry. This postern, having no flanking defence, was approached apparently by a wooden bridge across the external ditch, as there is an artificial gravel bank, rather nearer than midway, upon which one end of the construction could have rested. Although the past year's work has not exhumed any such extraordinarily

## MAGNIFICENT EDIFICES

as those found previously in Insula XIV., the examination of Insula XVI. has produced a large and important house of the courtyard type and two other houses of the corridor type, as well as an isolated square building, and traces were found of what were probably structures of wood. The collections of glass, pottery, bone and metal articles, coins, &c., are not less numerous and interesting than usual. Roman wood relics are always rare by reason of the perishable nature of that material, and, therefore, the leg of a domestic stool in turned hardwood, although broken, is a cherished rarity. Many slabs and smaller portions of Purbeck marble, and of a purple, green, and white Pyrenean marble used in architectural constructions, have been obtained, found near the east gate. The explorations to be next taken in hand are those of the Insulae XVI. and XVII., and the site of the buried building in Insula III., into which the water conduit from the postern ditch was carried.

GLIMPSES OF NORMANDY AND  
BRITTANY.

By CHARLES R. GILCHRIST.

IN a paper such as this, which I do not desire to render of a purely professional nature, it will be impossible for me to enter fully into the details of the buildings and objects of interest which constantly cross one's path in Normandy and Brittany. I shall therefore only endeavour to portray as briefly as I can the leading characteristics of the country and of the towns visited. Of Cherbourg, to which we crossed from Southampton, I shall say but little, as it does not merit much attention. Being a military port, it lays no claim to architectural beauty, ancient or modern, but it is somewhat pleasantly situated. The public buildings of Cherbourg are few and devoid of interest, and the Churches are lacking in beauty and mostly modern; the harbour, with its enormous mole, however, is a masterpiece of engineering skill, and the more so owing to the stormy nature of the coast, which presented great difficulties to be overcome. Bayeux is a dull, dreamy little town, of about 10,000 inhabitants, on the banks of the little river Aure, and its main objects of interest are its famous Cathedral, no less famous tapestry, and its interesting

## MEDIÆVAL HALF-TIMBERED HOUSES.

The Cathedral is a remarkable building, and dates from the twelfth century—west front thirteenth century. The two towers are 252ft. high, and the somewhat novel feature of the lantern is in itself of exceeding beauty. Internally, the nave has Norman arches, surmounted by the triforium and a clerestory of great height—a common feature of Norman Cathedrals. The famous tapestry, a fac-simile of which may be seen in South Kensington Museum, London, is a most interesting work, and is believed to have been executed by Queen Matilda, wife of William the Conqueror, and the ladies of her court; it is 20in. wide, 213ft. long, and consists of fifty-eight tableaux illustrative of the conquest of England. Quaint and curious as the representations are, it still gives evidence of much skill, and, although the drawing of the figures in many instances possesses a somewhat comical element, it yet forms so invaluable a record of the history of these remote times that it must be regarded as an object of veneration and unusual interest. The old half-timbered houses of Bayeux are very interesting, and point to the origin of that class of work so much practised in England in former times as well as now; but Normandy literally teems with such relics, and the silent description of illustration for such subjects is best. On the

walls is a sketch of the oldest half-timbered house in Bayeux, and perhaps in all Normandy; it shows much evidence of its antiquity in decrepit old age, but, like the sturdy oak from which its timbers are hewn, it has braved the ravages of time, and what was once the abode of the important and affluent is now a hostelry or restaurant, as its signs testify. From Bayeux our route lay towards Lisieux. Lisieux is a town of much more importance commercially than Bayeux. Its commercial aspect renders it none the less one of the most interesting towns in Normandy, on account of its Cathedral—old Norman, and buildings, especially of the half-timbered class—one street alone, the Rue aux Feves, where they abound, being quaint and curious beyond description.

## THE CATHEDRAL, ST. PIERRE,

was commenced in 1045, and was several times destroyed, but rebuilt in 1226, and has been restored in the style of that period. An interesting old Church is St. Jacques, a fine specimen of the fifteenth century, the tower of which was left unfinished, and later on quaintly roofed in slated work. But all Norman towns, in wealth of architectural riches, pale before the home of Churches, Caen, to which we next shaped our course from Lisieux. Caen is a town of considerable extent; it has good streets and shops, and for all who wish to study Gothic Architecture few places afford better opportunities than Caen; for old houses, too, it is a rich field, when we refresh ourselves with its history, so reminiscent of the renowned William the Conqueror, whose ashes lie interred within one of her Churches, St. Stephen, better known as the "Abbaye aux Hommes." I will not enter into any detailed description of the many Churches which adorn Caen, but St. Pierre, in the centre of the town, with its beautiful pointed spire, graceful tower, and exquisite interior, is rich beyond description. Then there is St. Stephen, or the Abbaye aux Hommes, which I previously mentioned as the last resting place of William the Conqueror, built towards the end of the eleventh century, and enlarged by a new choir in 1215, then much injured by the Huguenots in 1562-1566, and subsequently restored in its original style at the commencement of the seventeenth century. The exterior is very plain, but finely proportioned; the dignified simplicity of the two lofty towers of the west front and the massive solidity of its interior gives us one of the finest examples of the characteristics of

## THE EARLY NORMAN PERIOD.

Besides the two Churches briefly mentioned, there is the Abbaye aux Dames, or Church of the Holy Trinity, founded and consecrated in 1066 by Queen Matilda, and many of minor interest too numerous to mention in detail. Apart from its riches in Church Architecture, Caen also possesses exquisite examples of Renaissance in its Hôtel de Valois, Court of the Halles, Monnaies, &c., and, in domestic work, half-timbered houses in abundance, many highly ornate or quaint and curious. A short visit was made to the fine old Renaissance Château of Fontaine Henri, the home of one of the nobility, but, although allowed by the Marquis to stroll around the building and visit the quaint little private chapel, we were not afforded the privilege of viewing the interior, much to our regret. At Norrey we spent a little time in sketching and looking around us, and then the command of "All aboard" was given, and we returned to Caen. We proceeded to St. Lo, a picturesque little town, beautifully situated on a steep hill above the river Vire. Small as it is, St. Lo possesses one of the best-known Cathedrals in Normandy of the Decorated period, with two towers of different periods, the pierced, or tracery, work in one being strikingly peculiar. Apart from its Cathedral, St. Lo possesses its share of old buildings, conspicuous amongst which is the Maison Dieu, half-timbered, and having

## SOME GOOD CARVED WOODWORK;

but, in common with many of the old houses in Normandy, this building, with its restoration, has had to subordinate the antiquarian to the utilitarian aspect, and permit of the ground floor being converted into modern shops.

Alas! that the practical age in which we live should tend to drive us so much to consider the monetary element in everything; still, in the majority of cases throughout Normandy it may be said that, as a rule, the best has been retained and well preserved. From St. Lo we proceeded to Coutances, a town of somewhat similar size to St. Lo, but its Cathedral surpasses that of the latter town, and is, indeed, one of the finest Gothic buildings in all Normandy, and dates from the thirteenth century. The centre tower, although spireless, is very fine, and the lantern in the interior most elegant, while the great height of the clerestory renders the nave most lofty in appearance, and its nave chapels, separated therefrom by foliated screens of stone tracery, are remarkably beautiful. As the building stands upon the summit of a hill above the town, it forms an object of commanding attraction in the landscape. This was the last town we visited in Normandy, and we now entered Brittany, going to Pontorson *en route* for Mont St. Michel, the shrine of every visitor to that part of France. Pontorson forms a very convenient halting place from which to visit Mont St. Michel, and has a good deal to interest as well as material for the sketch book. The old Church, a granite structure, proved very curious and interesting on inspection, and in the interior are some very quaint

GROTESQUES, RUDELY CARVED IN GRANITE, and the saddleback tower of the Church is a typical specimen of the period. The hotel, where we found comfortable quarters, had formerly been a residence, and I should think dates from the seventeenth century; the staircase, with its curious newels, specially claimed our attention. Pontorson is only distant about five miles from Mont St. Michel, a little town consisting of one street, which winds up the side of the rocky eminence. The numerous buildings clustering around this conical rock are full of romantic interest, and a brief outline of them must fail to impart anything like a true conception of this unique and truly wonderful place. In as few words as possible, then, let me merely point out the most interesting features of the wonders of Mont St. Michel. Following up the street of the little town, we proceed up flights of steps until the Castle Convent is reached, a three-storied building with fine cloisters, the constructional parts of which are in granite and the carvings in limestone, every capital and spandril around these cloisters being beautifully carved, and no two are alike in design; the Halles des Chevaliers (Hall of the Knights) underneath the cloisters dates from the thirteenth century, is formed of four aisles and vaulted between, and possesses two large and boldly designed chimney-pieces. Then there is the Church to be visited, with its lower Church or crypt, the refectory, the dormitory (a large hall over the refectory and of the same dimensions), the vaults and dungeons, and the ramparts, from which extensive views of sea and land are obtained. Much has been done in the work of restoration, and much yet remains to be done; but the French Government is fully alive to the value of its possession, and we may confidently look forward to the time when Mont St. Michel will unfold all its beauties. Dinan is a romantically situated little town. Although not

#### RICH IN OLD CHURCHES

or in public buildings, it offers a wide field for the Artist or antiquarian, as the town contains many curious old houses and other objects of interest, whilst the ruins in the neighbourhood and the rich and varied nature of the landscape give ample scope for artistic inclinations. The ruined Château La Guaraye, about two miles from the town, is well worthy of a visit. Built in the Flamboyant style of the sixteenth century of grey granite, richly carved in parts, but little of it now remains, and that much weathered, yet it gives every indication of having once been a structure of considerable beauty and extent. The Church of St. Sauveur, a mixture of Norman and Perpendicular, the principal Ecclesiastical relic, does not merit much attention, but the quaint old streets and the clock tower give an old-time air to pretty little Dinan.

## Professional Items.

ARBROATH.—The building trades have been fairly busy recently, and a good many dwellings-houses have been put up, as well as buildings of a more public nature. In the east end Mr. Spalding has put up six workmen's cottages in Ernest Street, and Messrs. M'Laren and Nairn have added six semi-detached cottages to those they had previously erected at the north end of Carnegie Street. At the foot of High Street Mr. Fife, builder, has put up a two story tenement for four tenants on the site of some old houses, and he is also erecting a three story one in John Street to hold six tenants. A cottage has been built in Union Street East by Mr. Reid, builder, and the same builder has put up a self-contained cottage on the lands of Lochlands near Little Cairnie. Messrs. D. Ramsay and Son have finished two tenements in St. Vigean Road, to hold four tenants each, and are about to build two others. In the west end, four semi-detached villas have been put up by Mr. Spalding in Addison Place. Two semi-detached cottages have been erected by Messrs. Ramsay and Gordon in Hillend Road, and the same firm are proceeding with two similar cottages. The Parish Council offices in Hill Street are now finished, and the Public Library Building is progressing. In public works Messrs. Fraser and Sons' extension of Westburn Works are on a very large scale.

BERMONDSEY.—The Chairman of the London School Board, the Marquis of Londonderry, opened a new school in Page's Walk, Old Kent Road, on the 23rd ult. The school adjoins the Guinness Trust Buildings—four huge blocks of model dwellings containing nearly 600 tenements—and has accommodation for 358 boys, 358 girls, and 458 infants. The school was the 413th school opened by the London School Board. The site had cost £13,769 and the building £19,489. The buildings included a schoolkeeper's house, a laundry centre, and a manual training school.

BIRMINGHAM.—A great improvement has been effected in the dome of the Council House by the regilding of the lantern. The Estates Committee has discussed the desirability of gilding the ribs of the dome, which are about 100ft. in length, and 14in. wide. The cost would be about £200.

BLACKBURN.—The new Swedenborgian Church in Anvil Street was opened a few days ago. The new place of worship has been erected on the site of the old Church, at a cost of about £2250, in free Gothic design, the material being brick and terra-cotta. The Church affords accommodation for about 275 persons. Mr. Walter Stirrup, of Richmond Terrace, is the Architect.

BODMIN.—The commodious Free Library which Mr. Passmore Edwards has presented to Bodmin was opened on the 24th ult. Conveniently situated at the junction of Fore Street with the Beacon Road, the building is two stories in height, and built of local stone with Bath stone dressings. A conspicuous feature of the interior is a broad and lofty corridor, handsomely tiled. Spanning the central lobby are a series of bold intersecting arches, supported on pilasters of Bath stone, with moulded caps and keys. On the right of the lobby on the ground floor is a reading-room. Further along the corridor is a still larger room, intended to be fitted up as a lending library. On the other side of the smaller lobby is a room which will be furnished as a reading-room for boys. Opposite the principal reading-room is the magazine-room. All the rooms are paved with wood blocks, and special attention has been paid to the ventilation, as well as to the lighting. As previously stated, Mr. S. Trehane, Liskeard, was the contractor, and the designs were prepared by Mr. Silvanus Trevail, Architect, Truro, the cost being about £2000.

BRADFORD.—An important addition is being made to the buildings of the Bradford Infirmary, the erection having just been begun of a nurses' home, which will occupy a site on the Westgate side of the Infirmary grounds. The total cost of the structure when completed and furnished will probably be about £10,000. Accommodation will be provided for over fifty nurses, the majority of whom at present occupy a house near the south end of the Infirmary garden. In accordance with the regulations of the Corporation, the building is being put up behind a line which will make Westgate, so far as bordered by the Infirmary premises, some 15ft. wider. The present wall separating the Infirmary estate from Westgate is being set back for that distance. The existing lodge is to come down, and will be included in the new structure, and the new building itself, of course, will stand behind the rebuilt wall. The style of Architecture adopted in the Infirmary buildings is that of the Tudor period. The Board of Management discussed for some time the question whether it was necessary in the new building to follow the same style, the cost of which has rapidly increased during the past twenty years, owing to the very greatly enhanced price of labour. When figures were gone into it was found that the cost of building in ashlar and ashlar wallstones, as in the case of the Infirmary, with its Tudor style and elaborate masonry, would reach a total expenditure of so large amount as to be almost prohibitive. It was, therefore, decided to erect a plainer building, which will be a modification of the style prevalent in the earlier part of the eighteenth century. Although the new Home will not be entirely devoid of ornament, ornament will be made subsidiary to utility, and it may be stated that the windows will be free from mullions, which give rise to a great deal of complaint in the Infirmary, as they take up air space and obstruct light. The new building will stand parallel with Westgate. It will be 142ft. in length, 42ft. wide, and four stories in height, including the basement, which, on the lower or Westgate side, will be entirely out of the ground. The ground floor will contain the main entrance, which will be on the east side of the building, opening into the Infirmary garden. The entrance hall will lead into a corridor running the full length of the building north and south. The Architects for the whole of the work are Messrs. Milnes and France, and the contractors are as follows:—Masons and joiners, Messrs. William Ives and Co., Shipley; slater, Mr. James Smithies; plumbers, Messrs. Stead and Hutton; plasterers, Messrs. B. Dixon and Co.; and painter, Mr. S. Lupton.

BRISTOL.—The restoration of the tower of St. Thomas is now rapidly approaching completion. The old building, which was known as St. Thomas's Church, was destroyed in 1789, and so solid was the masonry that some portions of it had to be blown up by gunpowder. The work of erecting the present building was completed in 1793. The original tower, which is a very good example of the Perpendicular style, was allowed to remain, but it had become so dilapidated that restoration was sorely needed. A considerable portion of it has been refaced, and a new parapet and pinnacles have been added. As far as possible the old lines of the tower have been followed, and the surface has been disturbed only where the stone has decayed. The cost of the work, which amounts to something like £1600, is defrayed by a legacy left by the late Mr. Frayne. Mr. Gough, of Bridge Street, is the Architect, and the work has been carried out by Messrs. Cowlin, who restored the tower of Bristol Cathedral.

CLYDEBANK.—At the shipyard belonging to the Clydebank Engineering and Shipbuilding Company, Limited, there has been erected an extension to boiler shop, composed of three bays, two of which are covered with a light wood roof and asphalted felt, the other with an iron roof and galvanised sheets. The larger bays have cast-iron columns 37ft. high, with shoulders on them to carry the travelling crane girders, and are spaced 30ft. apart. At

the side concrete piers support the crane girders and the roof, with brick walling filling in between. The contractors were: Ironwork, Arrol's Bridge and Roof Company, Limited, Germiston; brickwork, R. McAlpine and Sons; joiner work, J. and G. Findlay. Convenient to the boiler shop there is built a new drawing loft, the contractors for which were: Ironwork, Bladen and Company; brickwork, R. McAlpine and Sons. A new gatehouse has also been erected, which stands in a recess in Dumbarton Road, and, being of effective design, gives a pleasing appearance to the street. It has a facing of terra-cotta bricks, red pointed, with Ballochmyle stone cope, cornice, and pediment. Alexander McEwan and Son, Partick, were the contractors for the brick and mason work. There are also nearly finished a brass foundry, brass-finishing and copper shops, with hydraulic room, electric house, and "Dowson" gas producer. The power required for the travelling cranes, hydraulic accumulators, electric lighting, &c., is got by gas engines supplied from the "Dowson" gas apparatus, which is claimed to be less costly than steam power. The contractors are: Ironwork, Findlay and Co., Motherwell; brickwork, R. McAlpine and Sons. The whole work will cost £25,000. The Architect is Mr. T. McIntosh Scotland, 132, West Nile Street, Glasgow, and Airdrie.

**COTHAM.**—The restoration of the Wesleyan Chapel is proceeding rapidly, and memorial-stones were laid a few days ago. The original outlines of the structure will be observed, with the addition of an organ and choir chamber at the rear. The walls will be of pennant stone, with Bath stone dressings, the internal fittings of pitch-pine, the choir having a groined ceiling and carved stall ends. The pulpit is to be of the same design as before, but somewhat larger. The Architects are Mr. R. Curwen, of London, and Mr. H. J. Jones, of Bristol, and the builders Messrs. Stephens, Bastow, and Co. The estimated cost is close on £7000, of which nearly £6000 is forthcoming from insurance of the original building.

**CROSBY.**—The foundation-stone of a new Congregational Church was laid at Crosby a few days ago. The Church is being built from the designs of Messrs. Daggers and Fordham, of Chester, with facings and dressings of Run-corn stone. It will provide seating accommodation for about 600 persons, and will have a nave, north and south transepts, chancel, choir vestry, and clergy vestry. The chief entrance, with a large porch, will be in Mersey Road, and there will be another entrance to one of the transepts, also in Mersey Road. The amount of the building contract is £5700.

**DUNDEE.**—Although there has recently been little said or done regarding the site to be occupied by the statue of Her Majesty in Dundee, a very decided change is observable in the attitude of the municipal authorities upon the question. There can now be no doubt that there is a great preponderance of opinion in favour of the site in front of the High School gates, and an additional reason has just transpired for the selection of this position. It seems that instead of having a measurement of 18ft. as had been intended, the base of the statue will be 22ft. square. This fact will practically involve the abandonment of all idea of placing the statue in High Street, for there is no part of that thoroughfare sufficiently spacious to allow of the laying down of so large a pedestal.

**FLOOKBURGH, LANCS.**—A new Church, in the Early English style, is about to be erected for Mr. Victor Cavendish, M.P., at Flookburgh, near to Holker Hall, in Lancashire. Plans have been prepared by Messrs. Austin and Paley; and the work has been let to various local firms. The Church, which will accommodate about 400, will cost about £5000.

**HARROGATE.**—The extensive improvements which are being made by the North-Eastern Railway Company at the Harrogate Railway Station are rapidly approaching completion. At the main entrance, facing James Street, a

central ring with annexe has been added, the approach has been widened, and an ornamental iron portico has been erected in the place of the old and inconvenient one. Two large entrances have been made, on each side of which are the stationmaster's and telegraph offices, together with a large parcels and left-luggage office and first-class gentlemen's waiting room. Four booking offices have been added, the woodwork being surmounted by an ornamental clock. A new entrance has been provided on the south side and a new roadway formed. Extensive embankment works have been opened out at the upper end of the south platform to afford provision for a new dock.

**LEICESTER.**—One of the most important reports that the Corporation of Leicester has had under consideration for years past was submitted at a recent meeting, when the Estates Committee asked for sanction to carry out a scheme for the erection of a block of tenement dwellings for the working-classes. The site of the proposed tenements is in Winifred Street, where the Corporation owns a piece of land that has, for a number of years, been lying vacant, and which, together with a plot that has been exchanged, it is now proposed to turn into a profitable investment, in addition to improving Winifred Street by widening it from 23ft. to 40ft. The building, which will be three stories high, and comprise fifty-one tenements, has been designed round an open space, which will be planted with trees and shrubs. Each group will have a separate entrance from the street, and into the courtyard at the back, whilst the staircase in each block will be constructed of fireproof material. Each tenement on the first and second floors will be provided with a semi-private entrance by means of a neat lobby off the main staircase, whilst in the rear balconies will be erected for each group.

**MORECAMBE.**—Plans have been prepared by Mr. Howdell, A.R.I.B.A., of Leeds, for a new Primitive Methodist Chapel and Assembly Hall at the west end. Tenders have been accepted for building the assembly hall as follows:—Masonry, &c., T. O. Dixon; joinery, &c., R. Clough; slater and plasterer, W. J. Cross; plumbing, glazing, and gasfitting, J. H. Brown—all of Morecambe; painting, Roy-lance and Horsman, of Leeds; and heating, G. Tankard, of Leeds.

**NORTH SHIELDS.**—The Corporation has recently built, on the western boundary of the Fish Quay, a large block of premises, which have been leased by the Northern Counties' Ice-Making and Cold Stores Company, Ltd. The Tynemouth Corporation has spent about £4000 upon the premises, but the Ice Company's expenditure on the necessary machinery and plant is close upon £16,000. The new building has a river frontage of 120ft., and is 36ft. in breadth. The building has been erected under the personal supervision of the Borough Surveyor (Mr. J. F. Smillie) by Messrs. W. Johnson and Sons; Mr. J. T. Cackett, Architect, Newcastle, has represented the Ice Company, and Mr. T. B. Johns has been clerk of works. The buildings are approaching completion.

**NOTTINGHAM.**—The foundation-stone of a new Church, which will re-place the temporary building of St. Simon's, Bobber's Mill Road, Hyson Green, was laid recently. The sale of St. Stephen's Church, Parliament Street, and of the glebe land forming part of the endowment, to the M.S. and L. Railway Company, realised about £10,000, which will go towards the cost of the new Church and its endowment.

**PANBRIDE.**—A stained-glass window is being erected in Panbride Free Church. It is a fine specimen of modern glass-staining, and finds a place in the west aisle. The panel is 16ft. in height and 2½ft. in breadth, and consists of a life-sized figure of St. Matthew, surmounted by a scroll. The window is supplied and erected by Messrs. R. Farquharson and Son, Arbroath, to the directions of Mr. James P. Bruce, Architect, Carnoustie.

**PENZANCE.**—Foundation stones of a new Wesleyan chapel have been laid at Wesley Rock, near Penzance. The new building will stand on the plot of ground immediately adjoining the present chapel, and will provide seating accommodation for 480 persons, and will be so built as to allow of the addition of galleries. The cost is estimated at nearly £2000.

**PLYMOUTH.**—Plans have been prepared by the engineers of the Great Western directors for the extension and enlargement of the baggage warehouse and the construction of a platform near the piers at Millbay. It is intended to more than double the warehouse in length by the erection of a new wing on the site now occupied by a foundry and boat-building yard. The new structure will be 245ft. long, increasing the total length of the block to 425ft. The old portion of the warehouse will be widened to 90ft., and the new building will be of corresponding width. The entire block will be two stories high. One important part of the scheme provides for the construction of a short line of rails. The new line will, by a bold sweep, traverse a corner of the timber yard, cut through a couple of warehouses adjoining, and pass direct into the baggage warehouse on the ground floor, where a platform will be constructed 420ft. long. Both rails and platform being within the building, a portion of the warehouse will practically be converted into a station, with perfect shelter from the elements. In future, therefore, passengers landing at Millbay Pier will be able to proceed by the covered way to the waiting-room, and after a much shorter detention there than is now necessary, will be conducted through the baggage warehouse into the train without suffering the slightest discomfort. But the scheme has one rather serious drawback. To obtain the necessary width for the new structure, it is proposed to absorb a portion of the short private road running from the West Hoe to the dock entrance. At present the roadway is 44ft. 6in. wide, and, according to the plans, a strip 13ft. 9in. wide on the western side of the thoroughfare would be thrown into the station part of the warehouse, reducing the width of the thoroughfare to an average of 30ft. 9in.

**ROSEHEARTY.**—The memorial to be erected at Roseheartly in honour of the Queen's Jubilee is to be a fountain. The design which has been adopted is that of Mr. Victor Mitchell, Architect, 12, King Street, Aberdeen. The structure, which is to be entirely of granite, will stand over ten feet in height, the lower base being square, and having rustic work splayed and margined. The die will be circular and of polished Rubislaw stone, with turned base and pedimented cap of the same material. The pillar and capital will be of Peterhead granite, polished, with rosettes cut on neck, and the whole will be surmounted by an imperial crown, also of Peterhead stone, finely finished. Two of the pediments are to be enriched with coats of arms cut in relief. There will be two drinking basins, of Peterhead stone, and also a trough for horses, and a couple of dog drinking basins. Messrs. Smith and Taylor, Ash-vale Place, are the contractors for the work.

**ROTHERHAM.**—The new suite of police offices in Frederick Street and Haward Street includes two spacious courts, corridor cells of the most approved type, conveniently arranged offices, waiting-rooms, and weights and measures department. The site is that of the Temperance Hall, the old police offices, and two or three cottages. The whole scheme, including the purchase of land, clearing of buildings, contract, &c., is understood to amount to about £20,000. The contractor has been Mr. Richard Snell, and the plans have been prepared by Mr. R. J. Lovell, Architect, of London.

**SOUTH SHIELDS.**—The North-Eastern Railway Company has decided to carry out improvements at the South Shields railway station, and increase the accommodation at

that terminus. The south side platform is to be carried back to allow a third line of rails to be laid down, so that an engine may be changed from one end of the train to the other when both platform lines are occupied. A footbridge is to be erected communicating between the two platforms, both of which, it is expected, will be used instead of as at the present time only the north platform. New waiting rooms and offices will also be built, and a carriage drive into Salem Street will be made.

TRURO.—The new Technical Schools now in course of erection will, when erected, be an imposing range of buildings extending from Pydar Street to St. Mary's Wesleyan Chapel, with the chief elevation fronting to the Royal Institution of Cornwall. Whilst not exactly on the same architectural lines as the Free Library, the schools will be in the Tudor Renaissance style, and assimilate with it. The Architect has harmonised the general appearance of the two buildings by the elimination of one of the library gables. The walls will be composed of a granite base, corresponding with the library, Bath stone dressings, and Plymouth limestone filling, and there will be mullioned transomed windows towards the front. Over the chief pediment will be placed the arms of the city of Truro. An inscription panel over the central entrance will indicate the memorial character of the schools. An ornamental fleche on the roof will ventilate the building. The woodwork of the interior will consist of varnished pitchpine, as in the library. The length of the new building will be about three times that of the frontage of the existing library. There will be a central entrance with porch and vestibule 10ft. wide, opening into a 6ft. corridor running right and left. Mr. S. Trevelick is the Architect.

WOLVERHAMPTON.—At a special licensing sessions Mr. E. A. Wilcock applied for an order to make important alterations to the Empire Music Hall and Vaults, situate in Cheapside and Queen Square. He explained that the present buildings were old and inconvenient, and it was proposed to take them down and erect a first-class place of entertainment, replete with every modern convenience; and it would be seen from the plans that the scheme would include the shop of Mr. Phillips, chemist, adjoining the Empire Vaults, together with some old shopping at the rear and Mr. Raybould's shop in Cheapside. The front would be of red brick with terra-cotta facings, the ground floor of granite, and the woodwork of mahogany, and it was estimated that the entire cost would amount to between £40,000 and £50,000. The plans having been inspected, Mr. Ward, of the firm of Messrs. Owen and Ward, Architects, Birmingham, explained that there would be nine entrances, and the building would be lighted with electricity, though a supply of gas would also be laid on. A fire-screen would be provided at the suggestion of the borough surveyor. The application was unanimously granted.

YORK.—The present premises of the York Dispensary, in New Street, having for some time been found to be inadequate, the directors recently acquired a site in Duncombe Place upon which the erection of a new building has been in progress for some little time. The plans show that the new dispensary will contain, on its ground floor, and quite separate and distinct from the residential part of the house, ample accommodation for the work that has to be done there. This will include dispensing room, a consulting room, specially fitted for ophthalmological and laryngoscopic work, two other consulting rooms for the ordinary daily work of the staff, and a large and comfortable waiting hall, which will accommodate at least three times the number of patients that the present waiting room will hold. On the first floor is provided sufficient sitting room and bedroom accommodation, with the necessary kitchens and other offices for the resident staff, and on the second floor are bedrooms for the servants, &c.

## Trade and Craft.

EAST HAM SEWER FATALITIES.

In Queen's Bench Division, on the 24th ult., the Lord Chief Justice and a special jury disposed of the case of Digby v. the East Ham Urban Council. It was an action by Mrs. Esther Martha Digby, widow of Walter Thomas Digby, suing on behalf of herself and children, to recover damages by reason of the loss of her husband. On July 1st, 1895, Walter Thomas Digby met his death in a man-hole connected with the sewage works of the defendants. The deceased on going into the man-hole was suffocated by noxious gas, and the plaintiff alleged that defects were permitted to exist which should have been known to the District Council, and remedied. It appeared that five deaths in all resulted from the condition of the man-hole in question. The deceased first entered for the ordinary discharge of his work in connection with the sewage, but his condition having been discovered, four other men entered successively to rescue him. The case was a test one. The defence was a denial of negligence, the Urban District Council pleading that it had used all reasonable precautions to prevent a fatality, which could not have been foreseen. This was a second trial, Mr. Justice Cave having non-suited, and the Appeal Court having ordered a new trial. The jury found for the plaintiff, awarding £225 damages.

PLATE-GLASS FOR MONUMENTAL PURPOSES.

A company of glass workers has recently discovered that ordinary plate-glass will make a more durable monument than the hardest marble or granite, for glass is practically indestructible. Wind, rain, heat, or cold will eventually crumble the hardest rock, and one can seldom read the inscription on a gravestone fifty years old, but a glass monument will look as fresh after the elapse of centuries as on the day of its erection, and the inscription can be made ineffaceable. The thick plate-glass used to glaze the port-holes of steamers will resist the stormiest sea, and is practically unbreakable.

THE EXPANDED METAL COMPANY, LIMITED.

"Expanded Metal and its Uses in Fireproof Constructions" is the title of an illustrated booklet issued by the Expanded Metal Company, of 39, Upper Thames Street, E.C. What expanded metal is must now be common knowledge. But for the benefit of the few it may briefly be described as mechanically cut or split and deployed or opened-out sheets of metal, having diamond-shaped meshes and strands of practically any desired sizes and thicknesses. This expansion thus produces greater surface or covering area than the extent possessed originally by the sheet operated upon, and without any waste of material. The advantages accruing are numerous and valuable, but undoubtedly it is used to the greatest advantage in combination with concrete, cement, or plaster in the erection of fireproof constructions and the like. Its value in such cases, especially where the strength and lightness of such structure have been duly considered as well as the prime cost, is incontestable. Manifestly the chief points to be aimed at in fireproof constructions are strength, lightness, efficiency, and, of course, reasonable cost. And proof is not wanting that concrete, having expanded metal as a sound and consistent basis or bed, possesses these qualifications, and in practice results have been far more satisfactory than in cases where a richer concrete or cement is used in order to give the floor greater tensile strength. In fact, the desirability of a combination of concrete and expanded metal, attaining as it does in a floor the maximum of strength and fire-resisting efficiency, cannot for a moment be in dispute. Other features of interest and merit in expanded metal are numerous; its superiority as a substitute for common lathing (attention being directed to the excellent manner in which the plaster or cement is

embedded and keyed to the metallic lattice work), its claims as a substitute for innumerable descriptions of wirework, its economic use in the metallic part of a structure, are only a few of many.

LINCROSTA-WALTON NATIONAL EMBLEMS.

The accompanying illustration is of a permanent bas-relief medallion of Her Majesty Queen Victoria, made of Lincrosta-Walton, by Messrs. Frederick Walton and Company. The medallion itself is 13in. in diameter, and can be hung up as a plaque, or framed as a picture, or let into a panel either in circular or square shape. Messrs. Walton and Company are

also producing in their well-known decorative material a series of national, ecclesiastical, and masonic emblems, ranging from the Royal Arms to the Badge of Ireland. All the designs may be had plain, decorated in two colours, or with heraldic decoration, and as works of Art—and loyalty—should come prominently to the front amongst the Jubilee decorations.

LONDON BUILDING ACT: UNSUCCESSFUL PROSECUTION.

An interesting point was raised in a case decided a few days ago in the Lambeth Police Court. The London County Council applied for penalties against Rowton Houses, Limited, for not obeying a notice served upon them by the Council under the London Building Act, 1894, section 14. The building in respect of which the complaint arose was Rowton Houses, Churchyard Row, Newington. Mr. Hopkins said there was no dispute about the facts; it was admitted that every fact necessary to raise the question must be found against the defendants. The allegation which concerned him was that the defendants' building was so high as to infringe the last proviso but one of sub-section 5 of section 13 of the London Building Act, 1894, and if that proviso applied, the building was certainly too high by many feet. If, say, the Gordon Hotels Company had done exactly what the defendants had done in the matter and, after complying with the requirements of the statute, as the defendants complied with them, had erected on that very site one of their palaces, he thought it must be admitted that they might have gone to any height they pleased, and that no question could have arisen as to the height under the proviso, because the Gordon Hotels could not be said to be within it. For all the purposes of the London Building Act he could see no possible difference between, say, the Gordon Hotels Company building a rich man's hotel, and Rowton Houses, Limited, building a poor man's hotel. He was strongly of opinion that all the real merits were with the defendants, and he dismissed the summonses. Mr. Hopkins allowed £15 15s. costs.

ELECTRIC SYSTEM OF THE BLACKWALL TUNNEL.

Some interesting particulars of the whole electric system of the Blackwall Tunnel have been supplied to us from official sources. There is a large generating station on the Poplar side of the river, where there are three

Lancashire boilers supplying steam to five compound steam dynamos of the latest type. Three of these dynamos are of 120 horse power, and the other two of 60 horse power. They supply not only light, but power to six motors driving pumps and lifts and the tools in the well-equipped workshop attached to the generating station. Mr. T. P. Gunyon, the Council's chief electric engineer, has designed the whole electric system, and he mentions one curious fact which probably not half a dozen of the ten thousand visitors on Saturday would have noticed, that though most of the incandescent lights are of 32 candle power, they are more powerful near the mouths of the tunnel—just where it might be expected that their power would be reduced. The increase, however, is in order that the transition from broad daylight to the artificial illumination of the tunnel may be less trying to horses and drivers on entering. The transition the other way, it might be added, is also a little trying, as was evidenced at the opening by many persons shading their eyes from the glare of the upper world as they emerged from the comparative gloom.

#### WHAT IS A SEWER?

The case of Fulham Vestry (appellants) v. London County Council (respondents), which recently came before the Queen's Bench Division, was a case stated by certain justices of Kensington. The appellants had applied for a summons against the respondents on a complaint, by the appellants, of a nuisance from "foul smells," "dangerous to health," arising from a surface sewer ventilator constructed by the respondents in the surface of a roadway within the appellants' district. The sewer formed part of the main drainage system of London. The complaint was made under the Public Health (London) Act, 1891, section 5. The appellants contended that the nuisance came within section 2 (1) b of the said Act, arising from a "water-course" or a "drain" in such a condition as to be dangerous to health. The respondents contended that the summary abatement of nuisances in relation to drains under the Public Health (London) Act, 1891, did not apply to public "sewers." The justices held that a public sewer was not within the definition of nuisances to be dealt with under section 2 (1) b of the said Act, and that they had no jurisdiction, therefore, to deal with the complaint, and discharged the summons, but stated the case.—Mr. Danckwerts, for the appellants, argued that a "sewer" came within the words "drain or watercourse."—Mr. Bosanquet, Q.C., and Mr. Horace Avory, for the respondents, contended that the drains dealt with by the Act could not be construed as including public sewers.—Mr. Justice Day held that section 2 (1) b of the Public Health (London) Act, 1891, could not be made to apply to defects in sewers vested in the London County Council, but only to premises, whether public or private, occupied by owners of property, as distinguishable from great public works constructed by public bodies for public purposes. No doubt the London County Council were liable, like any other public body, for any egregious mistake in the construction or maintenance of works intrusted to them by the Legislature, but for that they were only liable to the constitutional tribunals of the realm, and not to summary proceedings at petty sessions.—Mr. Justice Lawrence concurred. The word "sewer" was not contained in the subsection in question, and was probably purposely omitted.—Appeal dismissed.

The committee which has charge of the arrangements in connection with Gloucester's commemoration of the Queen's long reign has accepted the report of a sub-committee, which recommended that plans be invited for a library at a cost not exceeding £5000.

A NEW Roman Catholic Church at Colne has been opened by the Bishop of Salford. The building, which is not yet complete, will cost £4000, towards which £1000 has already been raised. At present the Church will accommodate about 500 persons.

## Correspondence.

### EXHIBITION OF FIREPROOF MATERIALS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Under the circumstances connected with the recent disastrous fire in Paris, will you permit me to direct attention to the Exhibition of Fireproof Materials made from Asbestos, opened in the large hall of the Society of Architects, St. James's Hall, Piccadilly, on Monday, the 31st inst.?

This Exhibition, suggested by the above deplorable event, has been organised in order to demonstrate means of assisting in the prevention of loss of life by the use of non-inflammable decorations in our homes and public buildings.—I am, Sir, your obedient servant,  
J. ALFRED FISHER,  
May 26th, 1897. General Manager.

## SOCIETY MEETINGS.

### The Architectural Association of Ireland.

—The closing meeting of the winter term was held at the Grosvenor Hotel, Westland Row, Dublin, the President (Mr. R. Caulfield Orpen) in the chair. Amongst those present were Messrs. A. J. McHoughlin, J. Coleman, P. F. O'Sullivan, Jas. H. Webb, L. O'Callaghan, F. Johnson, T. Slevin, A. W. Moore, &c., and R. M. Butler (Secretary). The meeting was held for the purpose of receiving an interim report from the Committee. The report was a most satisfactory one. The Association was only established in November last, and already numbered over one hundred members, seven new members having recently joined. Three classes met weekly during the winter months. In respect of these the President said that while there was room for improvement in regard to attendance at the classes, yet the results for so young an Association must be considered highly satisfactory. Reports from the secretaries of the classes of Design (senior and junior) and the building construction classes were read. It was decided that the annual excursion should be to Monasterboice and Mellifont Abbey. The proceedings terminated with a vote of thanks to the President for his conduct in the chair during the term.

**The Edinburgh Architectural Association.**—The Edinburgh Architectural Association visited The Binns and Midhope, Linlithgowshire, by permission of Mr. J. Cornwall Dalrymple and the Earl of Hopetoun. Mr. Thomas Ross, F.S.A. Scot., in describing The Binns, said that on plan it formed three sides of a square, the east wing being the oldest part, and probably dating from the sixteenth century, and the north and west wings from the seventeenth century. One, at any rate, of the fine plaster ceilings seemed to be by the same hand that executed those at Moray House, Edinburgh. Mr. Ross, in his description of Midhope, said it was a lofty mansion house situated in a picturesque dell, and quite hidden from view till one was almost within call of it. Oblong on plan, it was erected at three distinct periods. The whole basement was vaulted, and a small newel stair in the older part and a fine oak stair in the later gave access to the upper floors. Alexander Drummond, second son of Alexander Drummond, of Earnock, was the first laird of Midhope, and in the beginning of the seventeenth century the property passed into the hands of the Livingstone family, who probably built the eastern parts.

AMONG historic places in London now threatened with destruction is that interesting corner in Chelsea known as "The Apothecaries' Garden." Those gardens date back as far as 1721, when Sir H. Sloane handed them over to the Apothecaries for scientific purposes. A statue of the donor, executed by Rysbrack, stands in the gardens; and the fine cedar trees in the grounds, which were the gift of Sir Joseph Banks, are now over 200 years old.

## Enquiry Department.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I see by the Builders' Journal of 19th May that you have decided to open an Enquiry Department. I now take the liberty of asking you what is the best work on proportion of Parish Churches.

Hoping that you will be able to give me name of author of best work,

I remain yours,

JAMES P. McE.

[There is no book published dealing specially with the proportions of Parish Churches.

#### BRANDON'S BOOK:

Brandon's "Parish Churches," being perspective views of English Ecclesiastical structures, accompanied by plans drawn to a uniform scale, 160 plates, imp. 8vo., cloth, £1 8s., scarce, is a useful one of its kind.

#### BOWMAN AND CROWTHER'S WORK:

Bowman and Crowther's "The Churches of the Middle Ages," being select specimens of Early and Pointed structures, with a few of the purest Late Pointed Examples, with 126 fine lithographic plates, plans, views, elevations, sections, and details, 2 vols.; folio, half morocco, £7 7s., scarce, is a most valuable work; a parallel of the various styles, and illustrating the Churches by most careful measured drawings, to scale of elevations, sections, details, plans, &c.

Both these books you can obtain from Mr. B. T. Batsford, 94, High Holborn, London. The former at a cost of 22s., and I understand Mr. Batsford has a copy of the latter which you can have for £4 10s.—ED.]

THE erection of the new Roman Catholic Cathedral at Westminster is progressing satisfactorily, and will, it is hoped, be completed within two years. The foundations have been finished—at a cost of £15,000—and the granite façade is gradually mounting.

ONE of the best known Suffolk estates has just changed hands, Hengrave Hall, near Bury St. Edmunds, with its 4600 acres of splendid sporting land, having been sold by the executors of the late Mr. John Lysaght to Mr. J. Wood, of Whitfield, Derbyshire, and of Ivington, Herefordshire. Hengrave Hall is famous as the finest example of Tudor Architecture in the country. The building is of stone, and possesses some very fine ornamental carving.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements, Auction Sales and Contracts Open.

Prices on application. Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St  
Strand, W.C.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**BLYTH** (Northumberland).—For the construction of a road, &c., near Cowpen-square, for the Urban District Council. Mr. Robert Grieves, Surveyor, Seaforth-street, Waterloo, Blyth:—

Jacob Robson ... £274 13 4 | G. E. Simpson, New-  
Jos. Wardlaw ... 617 19 11 | castle (accepted) £261 14 3

**BRIDGEND** (Glam.).—For additions, &c., to Town Hall, for the Committee. Mr. George F. Lambert, Architect, Bridgend:—

David Llewellyn ... £730 0 | William Francis, Bridg-  
Thomas Roberts ... 662 5 | end\* ... £599 0

Charles Jenkins & Sons ... 610 0 | \*Accepted.

**BROMLEY** (Kent).—For the execution of drainage works, Mason's Hill, for the Urban District Council. Quantities by the Surveyor:—

Pedrette and Co. ... £254 6 0 | G. Bell ... £349 12 3  
Wm. Wadey ... 429 18 0 | R. Stockwell, Brom-  
Thos. Lansbury ... 418 8 6 | ley, Kent\* ... 845 0 6

E. Peill and Sons ... 403 5 6 | \*Accepted.

**CHEDDAR** (Somerset).—For building a shirt factory at Tween Town, Cheddar, for Mr. Joseph Edwards. Mr. David Cox, Architect, The Barrows, Cheddar. Quantities by Mr. William Veals, Bristol:—

H. A. Forse ... £275 0 0 | Ford and Scourse,  
Love and Waite ... 580 0 0 | Cheddar\* ... £439 11 6

\*Accepted.

**CLEETHORPES** (Lincs.).—For the execution of road works, Poplar-road (Contract No. 9), for the Urban District Council. Mr. E. Rushton, Surveyor, Poplar-road, Cleethorpes. Quantities by the Surveyor:—

A. Brunton & Son ... £1,045 6 11 | L. N. Davison,  
Hewins & Good- ... 899 12 6 | Grimsby\* ... £265 8 1

\*Accepted.

**COWBRIDGE** (Glam.).—For the restoration of Parish Church, Llantrichyd, for the Rev. E. L. Ellis. Mr. G. E. Halliday, Architect, 14, High-street, Cardiff. Quantities by Mr. John W. Rodger, Surveyor, 14, High-street, Cardiff:—

Williams & Thomas ... £960 4 9 | L. Merrett ... £750 0 0  
Wm. Cox ... 810 0 0 | W. James and Son,  
O. H. Cookley ... 800 0 0 | Cowbridge\* ... 705 0 0

Henry Smith ... 800 0 0 | Chas. Parsons ... 625 0 0

Rees and Thomas ... 750 0 0 | \*Accepted.

**DOLPHINHOLME**.—Accepted for the erection of a new Church. Messrs. Austin and Paley, Architects, Lancaster:—

J. Hatch and Sons, of Lancaster ... £2,659

**EAST HAM**.—Accepted for iron church in Coleridge-avenue, for the Rev. A. G. Prichard:—

W. Harbrow, Iron Building Works, South Ber-  
mondsey ... £285

**ELGIN**.—For the erection of a house on the farm of the Raich, Longmorn, for Mr. William Ramsay, of Longmorn. Mr. C. C. Doig, Architect, Elgin:—

Building.—Alexander Mackenzie ... £277 0 0  
Carpentry.—Mackie and MacKenzie ... 228 10 0

Slating.—James Wilson ... 48 16 0  
Plastering.—James Brodie ... 59 0 0

Plumbing.—William Lyon and Son ... 49 0 0  
Painting.—J. Kintrea and Son ... 17 7 6

[All of Elgin.]

**ELGIN**.—For the erection of business premises, South-street, for Mr. Charles Forsyth. Mr. C. C. Doig, Architect, Elgin:—

Building.—David Forsyth ... £907 0  
Carpentry.—A. and R. Dunbar ... 715 0

Slating.—James Wilson ... 35 10  
Plastering.—James Brodie ... 183 19

Plumbing.—J. Gordon and Son ... 114 0  
Painting.—Alexander Forsyth ... 54 0

Ironwork not yet accepted.  
[All of Elgin.]

**EXETER**.—For the erection of Emmanuel's Church, St. Thomas's. Mr. Harold Brakspear, Architect, Corsham, Wilts:—

Gibson ... £10,867 | Stephens and Son ... £8,880  
Herbert ... 10,042 | N. Pratt ... 8,295

C. Breaby ... 9,000

**GAINFORD** (Durham).—For the execution of Gainford sewerage work. Mr. Robert Robinson, Engineer, Darlington:—

Contract No. 1.—General work in laying sewers, building tanks, and laying out irrigation area.

Wm. Dodds ... £1,922 4 1 1/2 | R. McDonald ... £1,514 3 2  
J. Kyle & Sons ... 1,780 0 0 | Adamson ... 1,389 7 0

T. Lee ... 1,757 7 0 1/2 | P. O. Hetherington, Egglestone (accepted) ... 1,334 10 0

J. Clarkson ... 1,626 10 10 | R. Wilson ... 2,312 9 4

R. Wilson ... 1,570 6 7 | J. Clarkson ... 211 16 9

Contract No. 2.—Sanitary Pipes.

J. Kyle and Sons ... £250 0 0 | R. Wilson ... 211 16 9  
J. Dixon ... 245 5 5 | W. C. Clark (Straker & Love), Darling-  
R. McDonald ... 232 9 4 | ton\* ... 219 7 3  
P. O. Hetherington ... 227 10 0  
Adamson ... 223 11 6  
J. Crossley ... 218 9 0

\*Accepted.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

(Continued from page lxii.)

BY ALEXANDER DREW.

NO. V. OF SERIES.

THE calculations necessary to determine the value of the Moment of Inertia are by no means difficult or tedious for the more ordinary simple sections, and as these values may be added together, or subtracted from one another if desired, it is seldom that any section met with in practice cannot be divided up into a series of such simple sections, whose separate Moments of Inertia can be determined and added together, to give this value for the total section. Table IV. indicates how such calculations can be gone about, and may be sufficient for reference; a more detailed treatment must be looked for in some theoretical text-book. This same table also gives the result of the calculations of T and L sections of various sizes; as these are somewhat tedious, this will, in many cases, save some considerable trouble.

Time will only permit of a few words of explanation as to this table. The value of the Moment of Inertia for four simple sections is given, in each case this value being that for an axis passing through the centre of gravity of the section. If it be desired to add together or subtract these values from one another this can only be done when they are each calculated about the same axis; this must be specially noted. In determining the new value for the Moment of Inertia about an axis parallel to, but at some distance from the original axis, the original value for the Moment of Inertia must be altered by an amount equal to the area of the section multiplied by the square of the distance the one axis is removed from the other; if the new axis be further from the centre of gravity than the first, the new Moment of Inertia will be greater than the old, but should the new axis be nearer the centre of gravity, the value will be diminished by the above noted quantity.

The table given here indicates the area, the Moment of Inertia, the distance from neutral axis to furthest edge of section, and also the value of the Radius of Gyration for L or T section, set with reference to the neutral axis in the manner indicated under the table, where also is given the formula by which these values are calculated. This value of the Radius of Gyration, which it may be noted is equal to the square root of the Moment of Inertia divided by the area, will be found convenient in connection with Table II. previously given for the strength of struts; this value (as was previously noted) should be used where possible in preference to the approximate method of calculation given in the above referred to table. It must be borne in mind, however, that this value in the

case of L sections only holds good when the bar is retained in its square position. Should it be allowed to turn round, as it would tend to do, into the position shown in the small table of the values of (n) given with Table II., the Radius of Gyration is considerably altered.

The formula just given (8) will enable the strength of beams of ordinary section to be readily calculated, and where these are of L or

any of the noted conditions of loading; so that if the value of I and y are got at, these formulae will give the maximum strength of the several bars when used as beams. But should the member be a compound one, as it may be termed, and subjected to compression or tension in addition to this bending, a further step must be taken to determine the maximum stress. In practice it is usual to consider the

T section (as is frequently the case with roof purlins) the just described table will also materially simplify these calculations. Where the member is a simple beam, that is to say, where it is subjected to bending only, these formulae, by giving the maximum strength (or the maximum stress) under given conditions, supply all the information necessary, and they of course apply to any section of bar, and to

stress in the simple members of a roof truss as distributed uniformly throughout the full section of the bar, so that the stress per square inch in any case is equal to the total stress divided by the number of square inches in the section; but in a compound member we have first this uniformly distributed stress just noted, and in addition to that the varying stress which was last considered, and whose

NOTE.—At the twenty-eighth line from the beginning of No. V. of series the reference letters given as a, b, c, should be x, y, z.

Table IV.—MOMENT OF INERTIA (I), & RADIUS OF GYRATION (r).

$$y = \frac{d}{2} + \frac{\frac{1}{2}BDT}{BT + dt}$$

$$I = \frac{B(x^3 - z^3) + t(y^3 + z^3)}{3}$$

$$r = \sqrt{\frac{I}{\text{Area}}}$$

I. for Simple sections about an Axis passing thro' their Centre of Gravity.

$$= \frac{BD^3}{12}$$

$$= \frac{D^4}{12}$$

$$= \frac{BD^3}{36}$$

$$= \frac{\pi D^4}{64} = 0.049 D^4$$

I, about any parallel Axis at distance h from neutral Axis = I + (Area x h<sup>2</sup>).

I's may be added together, or subtracted from one another only when they are calculated about the same Axis.

Thus, I. for hollow rectangle, or hollow circle (ring) = difference between values of I for outside and inside dimensions;

and I for = I for one angle round neutral Axis x 2;

but I for = I, " " for " mutual x 2.

1897

maximum value was determined by means of the formula (8); thus, should the member under consideration be the rafter, the maximum compressive stress will occur at the outer or upper edge, and will be equal to the uniformly distributed stress per square inch added to the maximum stress per square inch determined by the formula (8). Should the member be a tie which has to support a ceiling, the uniformly distributed stress is now tension, and its value per square inch must be added to the maximum tensile stress determined by formula (8) to get at the total maximum tensile stress.

Having now considered, as far as time will permit of, the various theoretical considerations and methods by which the stress and scantlings of the several members of a roof truss may be determined, and having briefly noted several cases in which theoretical considerations are modified so as to allow of their more ready application without interfering to too great an extent with the accuracy of the result, we must now give what time is left to more practical details. The various sections which may be made use of in the case of rafters are very numerous, and in Fig. 30 is shown a few types of these. Where the roof is small, and consequently the rafter is short, and not subjected to any severe stress, section (1) may be used with advantage; this consists of a simple L section. For larger spans where greater stiffness is desired a T section (2) is generally adopted, and for the greater number of cases likely to be met with in practice this section will prove the most suitable. Should the roof be of a very large span, or should the type be so chosen that the unsupported length of the rafter is very great, and consequently considerable stiffness is required, an H section (3) might be made use of; but with a section of this kind complication or trouble is likely to arise in making a connection with struts and ties. A very simple form, which is now but seldom adopted, is that shown at (4), and consists simply of a fitch beam, the timber batten being sandwiched between two iron plates; where a continuous timber covering is used, this forms a very convenient means of getting the covering nailed directly to the rafters; but, owing to the liability to decay, and possibly also to a certain risk of fire, this section is very seldom met with now. Where a larger section is desired than can be readily got by a single T bar, two L's (5) may be employed; and if increased side stiffness is desired, these L's may be kept apart to a certain extent by means of packings. The section shown at (6) is formed with double channel irons, either placed close together or with packing between; such would only be required in the case of very large roofs, and would involve considerable detailing, and possible complications at the joints.

Rafters are, of course, only a form of strut, liable occasionally to intermediate loading and thus to cross bending, as has been just noted; and it is thus natural that the struts

should partake of much the same form as those of rafters. Nos. (7) to (13) illustrate a few of the many sections which may be used for struts; the solid round section (7) is but seldom met with, except in small roofs where a feeble attempt at ornamentation is sometimes attempted. (8) is that of an ordinary L section, and is very convenient where the length or the strain is not great; but should these become large there is always the liability of such a form to twist when under stress, and thus necessitate an excess of section to give the required stiffness. The T section shown at (9) is very useful in many cases. At (10) a simple form of double flat strut is shown, and is frequently made use of. (11), (12), and (13) each consist of double bars of the section shown, and are unlikely to be required, except for large spans.

(To be continued.)

## Surveying and Sanitary Notes.

MR. RIENZI WALTON recently conducted a Local Government Board inquiry respecting the application of the Springhead Urban District Council for sanction to borrow £7500 for purposes of sewerage and sewage disposal. Mr. A. Fidler, engineer for the Magnetite Company, whose scheme has been accepted by the Springhead Council, detailed the nature of the scheme, and added that the site was less than 300 yards out of the district of the Springhead Council. Mr. Charles James Lomax, engineer for several sewage disposal schemes, said he believed Mr. Fidler's scheme would deal effectually with the sewage of the district, and in his opinion the proposed site was the only one available in the valley.

THE new waterworks at Haverhill have now practically been completed. More than £10,000 have been expended in carrying out the scheme. The plans were prepared by Mr. John Kemp, and, after alterations suggested by Mr. Radford, an expert consulted by the Urban District Council, provided for a covered reservoir with a capacity of 150,000 gallons, two settling tanks, each of a capacity of 100,000 gallons, a neat engine-house, a commodious cottage, and four miles of mains. The well, which is in the engine-house, has a depth in brick of 103ft., with a bore of 150ft., making a total of 253ft. It is 7ft. 6in. in diameter, and the bore is 8in. The work has been carried out under the superintendence of Mr. Thos. Cockrill, the surveyor to the Council, with Mr. Wm. L. Catlin as clerk of the works, by the following contractors: Mr. Ingold, Bishop Stortford, the well; Mr. Selden Hipwell, of Wisbech, the reservoir, settling tanks, and buildings; Mr. J. Roberts, of West Bromwich, the mains; and Messrs. Crossley

Bros., of Manchester, the pumping machinery. Special interest attaches to the last-named section of the scheme, inasmuch as it embraces the first installation of a system of pumping invented by Mr. Jas. Atkinson, now engaged by Messrs. Crossley. The principle of this system is the forcing of the water from the well by means of a body of air which is alternately compressed into one chamber and exhausted from another. When the latter chamber is filled an automatic valve, which is really the kernel of the invention, reverses the suction and compression, so that the chamber which was last filled is discharged by compressed air, and the pressure that remains in the discharged vessel is brought back into the air compressor; consequently the power is not lost. From an hygienic point of view there are several advantages accruing from the system.

THE last lecture of the series for 1896-7 arranged by the Manchester Council for the Registration of Plumbers was delivered at the Municipal Technical School by Mr. H. Gilbert Whyatt, deputy borough engineer, Salford, who took for his subject "The Requirements of Municipal Authorities with respect to Plumbing." Mr. J. H. Edmiston, vice-president of the Council, presided.—Mr. Whyatt traced the progress of sanitary legislation down to the Public Health Act, 1875, and the Public Health Acts Amendment Act, 1890, in which plumbers had special concern. He then took the plumbers' work in a house *seriatim*, and explained the requirements of Acts of Parliament and local bye-laws, particularly those of Manchester and Salford, with regard to eaves, gutters, down-spouts, water-closets, cisterns, traps, soil-pipes, vent-pipes, waste-pipes, water-fittings, hot-water supply, gas-fittings, &c., and incidentally he discussed such matters as the allowance of water made for flushing purposes, the quality of material fittings, &c. In conclusion, the lecturer said that, seeing municipal authorities had such stringent regulations and powers, they should be very careful with regard to those whom they place on their "authorised lists" of plumbers. He agreed in the contention of the Association that nobody should be certified by a municipal authority as a qualified plumber (for that was how the public regarded it) without passing an examination such as was required from candidates for registration. Every plumber and journeyman in the district should be registered, as a guarantee to the public of his fitness to carry out the very responsible work entrusted to him, and the authorities might with advantage require anyone applying to be placed on the authorised list of plumbers that he should present the Association's certificate of qualification. On the other hand, he would require the Corporation inspectors to pass a searching examination in plumbing, for it was palpably unfair that a Craftsman who had spent years in learning a trade should be at the mercy of an inspector who might have no knowledge of the trade at all.

### How Japanese Wall Papers Are Made.

Most persons are aware of the manner by which English wall papers are prepared, but probably few are acquainted with the methods adopted in the preparation of the famous Japanese leather papers, which were first manufactured

For this purpose a large cylinder of hard wood is hung on a frame, and the engravers work on it, cutting out the design with knife and chisel. This is a matter of some importance, as the slightest deviation would mean the recutting of the block, and the greatest care has to be exercised to make the fitting and adjusting exact. The roller having been cut, the next step is to put the paper on, which is done by men. The paper is taken in pieces a yard square, and is laid, while wet, on the engraved cylinder. The operative then takes his brush, which is small, long handled, and filled with bristles, thick set in a rough and ready fashion, and with this the paper is beaten into the mould by means of a vigorous pounding process from the brushes. As each section is completed the cylinder is slightly turned, and

the discretion of the operator. Some of the truly wonderful deep bronze colours on these leather wall papers are brought about entirely by the use of these lacquers on the coating of tinfoil, and the absolute exclusion from the air which the lacquer imparts effectually protects the metal from any discolouration, and ensures that permanency which is so essential and valued a feature in these wall decorations. After the paper has been repeatedly sized as above mentioned, it is embossed, sized again, metallised (that is, covered with tinfoil), and lacquered, the embossed pattern or design being an all-over gold effect, when the next process, that of the laying in of grounds, is proceeded with by means of stencils, in the cutting of which the Japanese are adepts. The stencils are cut to fit the background, and girls with brushes

AN ATHENIAN CHURCH.

by the Japanese Government some fifteen years ago, at the Imperial Printing Works, where all the printing for the State is done, but the most interesting part of which establishment is where the pleasing leather papers are made. The first specimens imported to this country were somewhat too Japanese to give general satisfaction, but as it was soon found that the business was a paying one, the influences of the West were set at work, with the result that the character of the designs has undergone very extensive modifications, more in accordance with the tastes and desires of the western hemisphere. In this connection, the rarest and choicest leathers of Europe have been laid under contribution, and employed to supply ideas for the modern work. The premier movement in the manufacture of the completed leather paper is the cutting of the block.

operations go on in another part, the operation being repeated until the work is completed by the beating in of the whole design. Next, the paper is placed on bamboo poles, T-shaped at the end, and hung on a bamboo support to get dry, after which the process of decorating is proceeded with. In this somewhat crude state the paper is on its surface somewhat absorbent and spongy, very similar in its texture to blotting paper, when it is treated to several coatings of strong, which makes the surface non-absorbent and comparatively smooth. The metal has to be protected by two or three coatings of lacquer to protect it from discolouration. It is in the possession of this famous lacquer that the Japanese occupy an unique position, they being able to defy the world with this decorative element. It is this lacquer which imparts the golden tint to the metal, and its colour can be regulated at

lay in the ground with extreme dexterity and rapidity. Being constantly engaged in the manipulation of these stencils, the girls become very expert, detecting irregularities almost instinctively. They work in couples opposite each other, and, as they leave the parts on which they have operated, other girls follow them, touching up the ties of the stencils, wiping off the parts where the colour has gone over, and repairing any other little faults and irregularities. This done, the rolls of paper are hung up and allowed to dry, after which they are distributed to the native merchants, who send them to the various distributing centres for the consumers. Such, in brief, is the method in which the famous leather wall papers of Japan are manufactured—a method, in a sense, almost as interesting as the product itself.

### Works Department v. the Contractor.

THE existence of the Works Department of the London County Council still hangs in the balance. Protracted consideration of this question has not served to prompt decisive action on the part of the Council. It has wavered between the two contradictory proposals which were submitted at the meeting last week—as to whether Sir Arthur Arnold's report, which provides for the continuance of the direct execution of public works by the Council, should be adopted, or whether it should accept Lord Onslow's amendment, which practically authorises the abolition of the Department. Certainly its warmest friends can scarcely pretend that operations during the period of its existence have been satisfactory. It is, in fact, admitted on all hands that the Department has been a failure, and though it is not difficult to understand the hesitation of the Council in taking such a drastic step as the abolition of its most famous foundling, it is absurd that the folly should be allowed to continue. That it has been, and is a folly is now admitted by both friend and foe; and the attempt that has been made to explain away the whole business by a cry of "bad management" has met with little favour. There is something wrong in the system. The whole question resolves itself into the inability of the Department to equal the results of contractors, and proof of this inability—notwithstanding that the municipal body has been entirely free from those pecuniary embarrassments which often so severely handicap a contractor—has been painfully conclusive. That the future of the Works Department, should it escape annihilation now, must necessarily be one protracted blunder we do not mean to say, for the statistical record of its past activity reveals a fair measure of success in jobbing operations, and were it, therefore, reduced to the proportions of a jobbing yard, and controlled by experts, not by a committee of amateurs, it might enter upon a comparatively successful career, and might even make some atonement for its past misdeeds. The clamour for "direct employment of labour," which is really its only *raison d'être*, is an empty cry, and the warning that has been given of the probable formation—in the event of the disintegration of the Council's labour organisation—of a "ring" among the first-class contractors, who, taking advantage of the Council's helplessness to resort to any alternative method, would immodestly dictate their own terms for absolutely necessary undertakings, has manifestly been prepared to create greater precaution than the danger, real or imaginary, calls for. The whole question is, as the "Times" points out, whether the Council does or does not intend to persist in pitting its amateur knowledge and skill, possessed by men who have their own pressing concerns to attend to, against the professional knowledge and skill of contractors, whose whole business is to perform their contracts in the face of professional competition. It is obvious that a persistent following of this course must result in disaster. Certainly, if the corporate folly is to continue, the evil might at any rate be modified, in a measure, by the exclusion of architectural work from the Department's programme, for it is in this direction that it has made its greatest mistakes. It is not clear what the result of the Council's voting will be—it would appear that, technically, the duty of the Council is now to liquidate the Works Department—but it is reported that some compromise will be arrived at, allowing the Department to continue under certain restrictions. What the restrictions are we do not know, but it is to be hoped their effect will be to check, if possible, the seemingly exuberant recklessness of the Council's own contractors in the expenditure of public money.

### BREACH OF SANITARY BYE-LAWS.

THE action of *Simmons v. Malling Rural District Council*, heard in the Queen's Bench Division last week, was a case stated by the justices of Kent. The appellant, who was the owner of a public-house at East Malling, within the district of the Malling Rural District Council, was summoned before the justices in petty sessions for unlawfully constructing a cesspool in connection with his public-house at a distance of less than 50ft. from the house, contrary to a bye-law of the District Council. The public-house in question was an old building, and down to October, 1896, there were two cesspools constructed in connection with it at a distance of 3ft. from the house. One received the drainage from a urinal and two closets, and the other received the sink-water. In October, 1896, in consequence of a notice from the inspector of nuisances, the appellant caused the two cesspools to be

#### FILLED UP, AND CONVERTED

the closets into earth closets, and substituted one new cesspool into which the drainage from the sink and the urinal was carried. The new cesspool was 17ft. from the public-house. Owing to the size of the appellant's property, this was the furthest possible distance at which it could be constructed. The public-house was erected in a place which was not, at the time of the passing of the Public Health Act, 1875, included in an urban sanitary district, and it was erected many years before any order was made under section 276 of that Act, extending section 157 (which empowered the urban authorities to make bye-laws) to the respondents' district. Section 157 has since been extended to the respondents' district, and in 1895 the respondents made bye-laws, including the one in question, which were duly allowed by the Local Government Board. Part 3 of the Public Health Act, 1890, has been adopted by the respondents. The justices convicted the appellant subject to this case. When the case came on for argument before the Divisional Court, it was contended for the appellant (*inter alia*) that the bye-law was *ultra vires* and unreasonable. The Court thereupon intimated that it would be well that notice of the proceedings should be given to the Local Government Board, and the case was adjourned for this to be done. The case was subsequently re-argued, and at the conclusion of the arguments the Court reserved judgment. The appeal was dismissed. Mr. Justice Wright said that on behalf of the appellant certain objections had been taken to the bye-law under which the proceedings in this case had been instituted. The first objection was that the bye-law did not apply to buildings which were in existence at the time when the bye-law was made. The answer to that contention was that the language of the bye-law was quite general. The group or

#### BUNDLE OF BYE-LAWS,

of which it formed one, was headed "With respect to water closets, earth closets, privies, ashpits, and cesspools in connection with buildings." In other parts of the bye-laws, where it was intended to restrict their operation to new buildings, the expression "new buildings" was used. There was therefore no reason why the operation of this bye-law should be cut down in the manner suggested. Then it was said that the bye-law was *ultra vires*. The Public Health Act, 1875, section 157, subsection 4, gave powers to urban authorities to make bye-laws with respect to the drainage of closets and cesspools in connection with buildings. It was thought that that power might not extend to old buildings, and by the Public Health Acts Amendment Act, 1890, section 23, urban authorities were empowered to make bye-laws as to certain matters which were not included in the Act of 1875; and the section went on to say that any bye-laws under section 157, as extended by the Act of 1890, might be made so as to affect buildings erected before the times mentioned in section 157. Then section 23, sub-section 3, provided that the provisions of section 157 as amended—i.e., extended to old buildings—should be extended so as to empower rural

authorities to make bye-laws in respect to the said matters. Therefore the second objection raised by the appellant failed. Thirdly, it was said that the bye-law was unreasonable on three grounds. First, because it applied to old buildings. As Parliament had, however, expressly authorised that to be done, the bye-law could not merely on that ground be held to be unreasonable. Secondly, it was pointed out that in certain cases, of which this was one, the 50ft. limit would produce great hardship. It was obvious that public convenience required some fixed limit, and whatever the limit was some

#### HARD CONSEQUENCES—MIGHT RESULT.
